ROUND *versus* PRICKLY SPINACH.—I can fully endorse all "A. D." says of the round variety for winter sowing. When at Steventon Manor, Micheldever, Hants, nine years ago, I happened to be short of seed of the prickly variety, and just for experiment I made up the winter bed with six drills of the round variety, and to my surprise after a severe winter, it was by far the better of the two. For six years since I had charge of a market establishment in Surrey, where I found it to supersede the prickly in the open field both for hardiness and quality; so much so, I have entirely discarded the prickly variety for all purposes. *F. Kneller, Studley Royal, Ripon.*

A NEW HEMEROCALLIS.—At the exhibition in June last of the great York Gala and Horticultural Society, I was much struck with one or two seedling Hemerocallis staged by the Rev. G. Yeld, Clifton Cottage, York. I was so greatly pleased with it that I drew the attention of Mr. Potter, of Messrs. Backhouse & Sons' nurseries, to it as being of marked merit and in advance on all other Hemerocallis as to deserve acknowledgment, and a special Certificate of Merit was awarded to it. It was named Hemerocallis Apricot, and was a seedling from H. flava, crossed with H. fulva or Middendorfii, but deeper in colour than H. fulva, with much broader sepals, of good substance and much better form, and in size intermediate betwixt flava and fulva. I recently wrote to Mr. Yeld to ask him if there was any probability of its getting into commerce, and if he had any other seedlings, and in his reply he states, "I have been working at the Hemerocallis for some time, and have one seedling besides Apricot, which I consider very good. I should have exhibited it last year had it been in blossom at the time. H. Apricot is probably from H. flava crossed with H. fulva, but I have unfortunately lost the details of my crosses. I have a good many seedlings, some very good in habit, with large flowers on stems not much higher than the stem of H. graminea. I shall probably let them go into commerce eventually, but not for some time, as I am anxious to see what the second and third generations will do. I have seed of the second generation already." Mr. Yeld is also devoting attention to the hybridisation of Irises, and exhibited also at York last June blooms of a very lovely seedling, named Sincerity, a seedling from pallida, variety Queen of May, the standard short and well formed, curving gracefully inward, and a beautifully-formed flower. Other seedlings were also shown. Mr. Yeld informs me that these came from a pod of seed; he believes, the seed-bearing parent was I. pallida Queen of May, but the pollen parent he has no note of. Mr. Yeld states also in his letter, "I have had sad disappointment this winter. I had three big bulbs of Lilium cordifolium giganteum from seed, which should have flowered this year. They had been watched for about ten years, but the severe frost of the past winter has taken them. Possibly they were crossed with Lilium Parryi." *W. D.*

LACHENALIA AUREA GIGANTEA.—The remarks of Sir C. Strickland in your issue of the 25th inst., are evidently made under a misconception. My plant is certainly not connected with L. luteola, its foliage and habit being precisely that of L. aurea, only much stronger. No doubt Sir C. Strickland's plant is the same as another I had from Mr. O'Brien at the same time. This has very narrow dark green upright leaves, and has not yet flowered. There can be no doubt that my plant is an exceptionally robust variety of L. aurea, which, by the way, flowered with me simultaneously, L. luteola being rather earlier. *R. A. Todd, Honeyden, Foots Cray.*

SOCIETIES.

ROYAL HORTICULTURAL.

March 28.—The Drill Hall was again filled with exhibits of flowers in season on Tuesday last. We think the general public is at last beginning to appreciate these fortnightly gatherings, for the attendance seems to increase on each occasion.

Floral Committee.

Present: W. Marshall, Esq., chairman; the Rev. H. H. D'Ombrain and Messrs. J. D. Pawle, Owen Thomas, H. Herbst, R. Dean, C. T. Druery, G. Stevens, R. B. Lowe, C. F. Bause, F. Ross, G. Gordon, W. Furze, C. Jefferies, Chas. E. Shea, H. Turner, Chas. Noble, G. Paul, H. B. May, John Fraser, J. Jennings, R. Owen, Geo. Nicholson, and Jas. Walker.

An interesting group of Roses and other flowers was exhibited by Messrs. Paul & Son, Cheshunt. Of Roses, excellent plants of the varieties Heinrich Schultheiss and Innocente Pirola were shown; and such types as Rosa Andersoni, soft pink; R. arkansana, very

pale rose; and R. indica, Miss Lowe's var., the flowers rich rose. The comparatively new Bourbon, Mrs. Paul, was in fine character. The same firm had also the beautiful Polyantha vars., Epiphyllum Russellianum Gaertneri, scarlet; Cannas, and a large basketful of alpine plants in bloom, Narcissus Bulbocodium, Draba Aizoon, &c.; also the seedling Genista Andreana. Of the Amaryllis exhibited, the variety Lightning was of merit, the flowers of fine colour and form (Award of Merit). Lilac Alphonse Lavallée is a variety worth growing. It was well shown (Award of Merit). A First-class Certificate went to Aucuba japonica fructu albo, which is distinguished by its large whitish berries. For the group a Silver Flora Medal was awarded.

A miscellaneous group came from Messrs. J. Laing & Sons, Forest Hill, and comprised a number of very choice plants, such as Rhopoloblaste hexandra, a graceful Palm of fine colour (Award of Merit).

Cliveias were shown in variety, the brightly-coloured Boronia heterophylla, Cyclamens, and fine-leaved plants, as Leea amabilis, Bertolonia Madame A. Van Geert, beautifully spotted and veined with a pinkish colour; B. Ed. Pynaert, and a number of excellent Caladiums (Silver Flora Medal). Messrs. H. Low & Co., Upper Clapton, had also a miscellaneous collection of much interest, principally hard-wooded plants. Eriostemon pulchellum, Acacia Drummondii, Pimelea spectabilis, Chorozema Lowi, a delightful free and beautiful flower; and a very pleasing display of interesting New Holland plants. (Silver Flora Medal).

The immense group of Cyclamen persicum from the St. George's Nursery Co., Hanwell, was showy. The strain was spoken of in our issue for last week. An Award of Merit was accorded the strain, and a Silver Flora Medal to the group.

A large collection of Ferns came from Mr. H. B. May, Dyson's Lane Nursery, Edmonton, and included a number of kinds raised in this nursery, as the distinct and valuable Pteris Mayi, whilst we also noted P. regina cristata, P. serrulata densa, P. cretica nobilis, P. tremula elegans, Adiantum Weigandi, A. Mariesi, Osmunda palustris, and Microlepia hirta cristata. Such fine groups as shown by Mr. May make a welcome contrast to the gay masses of flowers (Silver Banksian Medal). Messrs. E. D. Shuttleworth & Co., Peckham Rye, S.E., had a variety of plants. One group was composed of remarkably well grown examples of Azaleas, the variety Deutsche Perle in particular, and Lily of the Valley, whilst they also contributed to the meeting a collection of hardy flowers, comprising the Prophet's Flower, Arnebia echioides, hardy Primulas, Daffodils, and a fine mass of the richly-coloured Iris persica. We have seldom seen this exhibited in finer character. A Silver Banksian Medal was awarded to the indoor flowers, and a Bronze Medal to the hardy plants. Messrs. Cutbush & Son, Highgate, had a collection of indoor plants and Epacris Lady Panmure, the flowers pinky-white; also Ghent Azaleas in variety, and other interesting plants (Silver Banksian Medal). Messrs. J. Peed & Sons, Roupell Park Nurseries, Norwood, showed fine-foliaged plants in variety, including Dracænas and Crotons, etc., all thoroughly well-grown (Silver Banksian Medal).

Of Cinerarias two groups were exhibited. The finest was from Messrs. J. James & Son, Farnham Royal, near Slough, the plants remarkably well-flowered, dwarf, a conspicuous feature of this strain. It is needless to write further, as the Farnham Royal Cinerarias are famous (Silver Banksian Medal). Mr. W. M. Bullivant, Homewood, Beckenham (gr., Mr. Thos. Cresswell), had a very creditable display, the plants well grown, and the flowers of bright colours (Silver Banksian Medal).

A large display of hardy flowers was made by Messrs. Barr & Son, Covent Garden. Narcissi were the chief things, and comprised the finest forms now in bloom, also Scilla bifolia alba, one of the prettiest hardy bulbs in flower at this time, an interesting series of forms of S. sibirica, showing the variability in colouring of this type; Muscari conicum, Fritillaria aurea, Primula rosea, Chionodoxas in variety, and Androsace coronopifolia, the flowers white and small, a very interesting species. Primroses of varied colours, &c. (Silver Banksian Medal).

Apart from the groups there were many important exhibits, Messrs. J. Veitch & Sons, Chelsea, had several interesting things. Chionanthus virginicus is a delightful subject for pots, the specimens shown being wreathed in the white flowers, its narrow petals having the aspect of a fringe. Magnolia stellata, or M. Halleana, as it is also called, was shown. It is the earliest species in bloom, and the rare pink variety, the flowers similar to those of the type, but of a distinct pink tone; a very charming form (Award of Merit). Rhododendron Yellow Gem is a distinct acquisition; the flowers are borne on a good truss, and individually are almost 2 inches across, robust and vigorous in expression, the colour clear self yellow, of a refined shade (Award of Merit). Several Hippeastrums were shown. The Moor, dark crimson self; Gaiety, white, barred and suffused with purple; and Syren, which is a variety of great beauty, the flowers large, segments broad and even, the colour of a distinct salmon-scarlet shade (Award of Merit).

Messrs. B. S. Williams & Son, Upper Holloway, had a number of beautiful Hippeastrums, as Ophelia, a distinct, handsome, and valuable flower of fine colour (Award of Merit); Curiosity, white veined with scarlet, and President Harrison, scarlet with broad band of white, very distinct. One of the most interesting plants shown was Ranunculus cortusæfolius, which was shown and certificated last year, and figured in our columns. The specimen exhibited, which was a very fine one, came from Lord Hylton, Merstham, Surrey (gr., Mr. C. Wood). From the same place came also the pretty Pea-flowered Psoralea pinnata, the flowers blue in colour.

Mr. Moore, Glasnevin Botanic Gardens, sent Hoya cinnamomifolia, Brownea grandiceps, and B. ariza, conspicuous for its full, large heads of exceptionally brilliant scarlet flowers (First-class Certificate).

Of unusual interest was the panful of Schizocodon soldanelloides, from Captain Torrens, Baston Manor, Hayes, Kent. It may be compared to Shortia galacifolia, and was introduced by the exhibitor from Mzyanoshta, Japan, in 1891, and shown at the spring show of the Crystal Palace in 1892. But the plants were nothing like those at the Drill Hall on Tuesday, which were remarkably fine. The flowers are fringed, of a pleasing rose colour, paler towards the margin, and borne freely on stems about 3 inches in height, the leaves bronzy-green, touched with crimson at the edge. It has long been known to science, but Capt. Torrens was the first to introduce the plant alive into England (First-class Certificate).

Cereus Hoveyi from Messrs. F. Ross & Co., Merstham, Surrey, is a brilliant flower. It is very compact, neat, and scarlet shot with a peculiarly bright satiny-magenta shade of colour, glistening in the sun, as if burnished (Award of Merit).

Cliveia Beechdale, from Mr. J. C. Geiselbrecht, Lee, Kent, has a compact head of red self flowers, very numerously produced. The colour is bright, and the whole plant very robust (Award of Merit).

Messrs. de Graaf and Bros., Leiden, had Scilla sibirica alba, a very beautiful white variety of the species, pure and free, judging by a few stems (Award of Merit).

Messrs. R. Veitch, of Exeter, exhibited Rhododendron gloxiniæflorum, which has neat, even trusses of flowers, white, freely spotted with lake on the upper portion; and Olearia stellulata, a neat little type, almost hidden by its white Daisy-like flowers —a charming and valuable plant for decorations (Award of Merit).

Mr. G. F. Wilson, Weybridge Heath, brought from his Wisley garden, flowers of his lovely blue Primroses, and a blue Polyanthus. It is noticeable that the flowers, if not exactly blue, at least, not the Gentian blue, are yet of a rich, warm, inviting colour, very effective and delightful.

A new seedling Auricula, of little worth, was shown by Mr. E. W. Underhill, Ealing. A bank of Stocks, named Model White, the flowers very pure, and produced on bold spikes, came from Mr. W. R. Newport, The Model Nursery, Hillingdon Heath, Uxbridge. Mons. H. de Vilmorin, Paris, showed flowers from the Riviera—Anemones, Daffodils, &c.

A very interesting feature of the meeting was constituted by the hybrid Narcissi, from the Rev. G. H. Engleheart, Appleshaw, Andover. One group consisted of pale coloured early flowers, the result of crossing N. albicans with some of the earlier yellow trumpet kinds, such we presume as N. pallidus præcox. A very beautiful series of colours was the outcome of this cross, varying from the palest primrose to richer yellow, one flower being like a pale N. obvallaris. A seedling from N. Horsefieldi, was of merit for its splendid corona and bold perianth. Hybrids of N. Empress ♀ and N. triandrus ♂ were shown, two flowers on a scape, and we get a finely intermediate result; also flowers from a cross made between trumpet Daffodils in variety and N. poeticus, to illustrate the origin of N. incomparabilis. One bloom was very much like N. Barri conspicuus, the corona margined with quite an orange scarlet colour. N. moschatus ♀ × N. poeticus ♂ gave a flower intermediate in form, but dead white, without a trace of the colour in the latter parent. N. cernuus ♀ × N. triandrus ♂ resulted in a very fine flower, the corona long, stout, and like the segments of a white tone. Two blooms were borne on the scape, and there is every hope that this will prove a vigorous growing and useful hybrid. It should be given a distinctive name. A potful of N. triandrus (the Glénan's var.) was shown. Flowers were fertilised with pollen of N. albicans and of the wild Pyrenean N. moschatus. Both crosses were effected. N. triandrus ♀ × N. corbularia citrina ♂, resulted in a neat, exquisite little flower, forming the good points of both parents. N. triandrus ♀ × N. poeticus ♂, was also interesting, the segments reflexed somewhat, and the small corona, pale yellow. N. triandrus ♀ × N. monophyllus ♂, gave a very small but beautiful flower.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien, Dr. Maxwell T. Masters, F.R.S., Thos. Statter, Sydney Courtauld, J. B. Haywood, De B. Crawshay, A. H. Smee, J. Jacques, E. Hill, Jas. Douglas, J. I. Gabriel, H. M. Pollett, H. Ballantine, R. Brooman-White, C. J. Lucas, W. H. White, and T. W. Bond.

There was a fine show of Orchids, and a leading feature was a group of rare Orchids from Messrs. F. Sander & Co., St. Albans, to which was awarded a Silver Flora Medal. Special plants in it were a magnificent form of Cattleya Trianæ alba, fine in shape, and of the purest white; a noble white form of the St. Albans type of Odontoglossum crispum, the finely-shaped O. Pescatorei Model, the purple-tinted O. P. picturatum, the singular Cypripedium Chamberlainianum platytænium, with broad labelloid petals; Cattleya Schroderæ varieties, both handsome and fragrant; Dendrobium nobile albiflorum, Cypripedium Burberryanum × (Boxalli × plunerum), some extra-fine Dendrobium Dalhousianum, showing great variation, and including the clear yellow with purple-spotted labellum, called D. D. luteum; Restrepia antennifera, and various fine hybrid Odontoglossums.

Sir Trevor Lawrence, Bart., Burford, Dorking (grower, Mr. W. H. White), showed a fine plant of the beautiful Dendrobium micans × (Wardianum × lituiflorum), the fine blush-white D. superbum Burkei, D. s. anosmum, D. Venus × (nobile ♀, Falconeri ♂), the pretty D. cretaceum, a fine form of Cochlioda Noezliana, and a curious Angræcum with a spike of small yellow flowers.

Philip Crowley, Esq., Waddon House, Croydon (gr., Mr. King), staged a pretty group, in which well-bloomed plants of Ada aurantiaca and Cypripedium villosum were the chief features; with these were a very fine pan of scarlet Sophronitis grandiflora, a very fine form of Cattleya Lawrenceana, some good Odontoglossums (Silver Banksian Medal). Thos. Statter, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), showed Dendrobium nobile Storerii, a pretty form with nearly white sepals and petals, the lip having a dark blotch at the base, surrounded by a pale yellow zone; D. splendidissimum Statterianum ×, with very large flowers for the size of the plant, and Cypripedium exul Annamense, which seems broader in leaf and darker in the colour of the flower than the type.

Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne (gr., Mr. Murray) sent a small lot of hybrid Dendrobiums, the best of which were D. "Bryan" × (luteolum ♀, Wardianum ♂), which in habit of growth and flower somewhat resembled a strong D. luteolum. The flowers were clear yellowish-white (nearly white), with some slight indication of the rose-coloured tips to the segments, as in D. Wardianum. The base of the lip has rayed brown lines on a yellow disc, which is clad with hair-like protuberances. Equally beautiful was Dendrobium "Sibyl" × (Linawianum × bigibbum). In the growth and manner of producing the flowers, there was no indication of D. bigibbum, except that the leaves on the new growths were thicker than in D. Linawianum. The flowers were produced in pairs, equal in size to those of D. Linawianum, bright dark rose-coloured, with the base of the segments white; lip white, with bright rose tip, and a yellow disc at the base, on each side of which runs a few brownish lines, ending in a small blotch. Mr. Cookson also showed forms of D. Ainsworthii and D. nobile, Oakwood var. (Cooksoni × nobile), which much resembled D. n. Sanderianum.

Mr. H. J. Elwes, Colesborne, Andoversford, R.S.O., Gloucestershire, exhibited a very interesting

and pretty group of specimens of terrestrial Orchids, the prettiest ofwhich was Calypso borealis, a handsome dwarf Arctic American species, which extends to Lapland. The specimen exhibited was from Alaska. Other kinds were Ophrys speculum; Orchis tridentata, cream-white; and Brownlea cœrulea, a South African species.

W. R. Lee, Esq., Beech Lawn, Audenshaw, showed a very fine and profusely-flowered plant of the true Dendrobium Wardianum album, in which the dark blotches seen at the base of the lip in many other white forms is nearly absent.

From the gardens of Earl Cowper, Panshanger, Hertfordshire (gr., Mr. Joseph Fitt) came four fine spikes of Vanda suavis, the edges of the petals being handsomely tinged with crimson.

Messrs. Jas. Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, showed Cypripedium microcheilum × (niveum ♀, Druryii ♂), and Dendrobium Alcippe × (lituiflorum Freemanii ♀, Wardianum ♂?) with flowers resembling in a great degree those of D. lituiflorum, but with some yellow in the lip.

G. R. le Doux, Esq., Langton House, East Molesey (gr., Mr. B. Bowyer), sent a fine plant of Cattleya intermedia Faustiana, a large and distinct form, Odontoglossum Andersonianum, Cypripedium barbatum nigrum and Odontoglossum triumphans.

W. C. Walker, Esq., Percy Lodge, Winchmore Hill (gr., Mr. G. Cragg), sent a form of Odontoglossum Andersonianum and Cypripedium Boxalli.

Thomas Gabriel, Esq., Elmstead, Leigham Court Road, Streatham (gr., Mr. H. Guyatt) showed a good example of Dendrobium Devonianum.

Baron H. Schroder, The Dell, Egham, sent another plant of Lælia × vitellina, and some fine spikes of a yellow Odontoglossum and O. Pescatorei Veitchianum.

Messrs. W. L. Lewis & Co., Chase Side, Southgate, staged a very fine group of Orchids of great merit, especially fine being the varieties of Odontoglossum Pescatorei, one of which, O. P. Lewisii, had the labellum of each of the flowers decorated with a wedge-shaped purple blotch. Also in the same group were some good Cymbidium Lowianum, one of which had greenish-yellow flowers, without the usual red colour on the lip; fine varieties of Cattleya Trianæ, Oncidium Marshallianum, O. sarcodes, O. lamelligerum, Trichopilia suavis, Aërides Fieldingii, Phalænopsis, Lycastes, Dendrobiums, &c.

Messrs. Heath & Son, Cheltenham, showed Odontoglossum excellens Tresederiana, a home-raised hybrid between a purple-spotted O. Pescatorei and O. triumphans. It is a grand form, showing more white than the usual run of O. excellens.

Messrs. Pitcher & Manda, The United States Nurseries, Hextable, Swanley, Kent. showed Cypripedium Greyanum × (ciliolare × Druryii), a strange variety with massive greenish flowers spotted and shaded with black; C. macropterum × (Lowii × superbiens), with greenish upper sepal with dark stripes; petals long and broad at the tips, rose colour, greenish at base and spotted on the lower halves with dark red, lip tinged with reddish-brown. Messrs. Pitcher & Manda also exhibited varieties of Cypripedium caudatum, C. orphanum × C. Druryi, C. Godseffianum ×, and Cattleya Luddemanniana. Manda's variety, with an enormous flower, of fine shape; the trumpet-shaped labellum rich crimson, veined in the centre with white.

Reginald Young, Esq., Fringilla, Linnet Lane, Sefton Park, Liverpool, sent cut spikes of Odontoglossum luteo-purpureum hystrix, O. Andersonianum, O. Rossii albens, and other forms of O. R. majus; a brightly-coloured Cattleya Trianæ, Dendrobium nobile Sanderiana (?), and two forms of Odontoglossum triumphans.

From the Royal Botanic Gardens, Glasnevin, Dublin, came a cut specimen of Physosiphon Moorei, n. sp., a near ally to P. Loddigesii.

C. L. N. Ingram, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), exhibited his Cypripedium × T. W. Bond (Swanianum ♀, hirsutissimum ♂), a noble variety, with some of the aspect of C. Curtisii. The ground-colour of the flower is dull light green, the base of the dorsal sepal is profusely dotted with black, and blackish lines radiate from the base. The petals are greenish at the base spotted with black, the outer halves being dark rose colour. The lip greenish, obscurely netted with pale brown. The same exhibitor sent Cypripedium compactum × (Sedeni candidulum × calurum), a dark rose-tinted form of the much-worked Sedeniform Cypripediums.

J. W. Temple, Esq., Leyswood, Groombridge (gr., Mr. Bristow), sent Lycaste plena and L. p. Templeæ, in the latter of which the flowers were very showy—the sepals green, spotted up the middle with brown.

Messrs. Fred. Horsman & Co., Colchester, sent Epidendrum varicosum. H. Shaw, Esq., Stamford House, Ashton-under-Lyne (gr., Mr. J. Cliffe), sent a fine flower of Dendrobium Wardianum, stating that it was one of thirty-four borne on the same pseudobulb.

Official List of Awards.

ORCHID COMMITTEE.

MEDALS.

Silver Flora.

To Messrs. Sander & Co., for a group of Orchids.

Silver Banksian.

To Philip Crowley, Esq., for a group of Orchids.

First-class Certificates.

To Dendrobium Wardianum album, from W. R. Lee, Esq.

To Dendrobium × Bryan, from Norman C. Cookson, Esq.

Awards of Merit.

To Cypripedium × microcheilum, from Messrs. Jas. Veitch & Son.

To Cattleya Luddemanniana, Manda's var., from Messrs. Pitcher & Manda.

Dendrobium Sybil ×, from Norman C. Cookson, Esq.

To Cochlioda Noezliana, from Sir Trevor Lawrence, Bart.

To Cypripedium × T. W. Bond, from C. S. N. Ingram, Esq.

Botanical Certificate.

To Calypso borealis, from Mr. H. J. Elwes.

To Angræcum sp., from Sir Trevor Lawrence.

Cultural Commendation.

To Messrs. Heath & Son, Cheltenham, for a fine home-raised plant of Odontoglossum excellens ×.

Fruit Committee.

Present: P. Crowley, Esq., in the chair; Dr. Hogg, and Messrs. G. Woodward, F. Francis Rivers, G. Bunyard, Arnold Moss, G. Taber, T. Saltmarsh, Harrison Weir, W. Warren, J. Wright. A. Dean, W. Bates, J. A. Laing, G. Wythes, J. Hudson, F. Q. Lane, H. Balderson, C. H. Pearson, and J. Willard.

The largest exhibit was one of Mushrooms, from Mr. Hardy, Ash House, Parson's Green. Mr. T. Lockie showed examples of his now well-known Cucumber, the fruits from seed sown January 9, 1893; thus it is good for very early work. Mr. Wythes, Syon House Gardens, Brentford, had splendid fruits of Strawberry Vicomtesse Héricart de Thury, bright in colour, of excellent size, and altogether deserving high praise (Cultural Commendation); also Figs St. John, to show its excellent early forcing qualities. Mr. Osman, The Gardens, Ottershaw Park, Chertsey, showed fruits of Strawberry Loxford Hall, very good; and Mr. H. Bannister, Cole House, Westbury-on-Trym, Apple Standard Bearer, and Mushrooms. Mr. Crook, Forde Abbey Gardens, Chard, had several varieties of Apples.

Lecture.

FLOWERS OF THE RIVIERA.

An interesting paper written by Mons. Henry Vilmorin was read by the Rev. W. Wilks the secretary, owing to the absence of M. H. de Vilmorin through illness, who had, however, sent his son, Philippe de Vilmorin, to represent him. Dr. Hogg was in the chair, and there was a large attendance. M. H. de Vilmorin wrote of the climatic conditions of the Riviera and its flowers. He spoke of the sheltered situation of the Riviera, where there is three times more sunshine than in England; little artificial heat is used in the plant-houses, hot-water pipes being laid flat on the ground, and are only required in case of sudden emergency. He wrote at length concerning the Acacias, which grow splendidly in the Riviera. A. dealbata is the sweetest and most graceful of all Acacias, and flourishes round Cannes, but on calcareous and heavy soils it sickens and dies. Several species were mentioned, as A. retinodes, and the Eucalypti were alluded to as E. cosmiphyllus, which has medium-sized white flower heads and greyish leaves, and is a great favourite in the Paris markets. E. globulus is another important kind, the flowers large and attractive. M. de Vilmorin here paid a warm tribute to the garden of Mr. Hanbury, La Mortola, and of the Villa Thuret. Roses are everywhere on the Riviera, on trees, railway banks, and Safrano was especially referred to, as it is not like other varieties, often crippled in the winter. The flowers are very variable in size, and the long conical buds are known as Nice Roses. The single Gloire des Rosomanes is more perpetual in bloom than even Safrano, but the flowers are too perishable and short-lived for the trade. Lamarque will succeed in the open air, or on a wall, flowering in the winter, but even the hardier kinds are better for a light screen to keep off frost. Gloire de Dijon is not a success; its flowers are too full. Marie Van Houtte, Perle de Lyon, La France were mentioned. White and yellow Marguerites, Chrysanthemum lutescens are grown largely on the Mediterranean coast, and the yellow variety is the more valuable, and supposed to have originated as a chance seedling. It grows into large bushes, 3 feet or so high, and as much in diameter, and the flowers keep fresh in water for seven days. Perpetual Pinks are grown, and the Marguerite variety will probably be very largely cultivated. M. de Vilmorin made interesting remarks about the dyeing of flowers, white in particular, but the practice soon died. The revival, however, as applied to white Roman Hyacinths and Lilacs, appears to be successful. Narcissus poeticus is found in Provence, which dots the land with dazzling white; and Gladiolus Colvillei alba was also mentioned as a market flower; and Allium neapolitanum is grown in increasing quantities, but the stems must be handled carefully, as if bruised they give out a Garlic smell. Freesias are in increasing demand, and M. de Vilmorin also described the Anemones, so familiar in London markets now. Violets and Iberis gibraltarica are grown largely, and the Neapolitan Violet is cultivated by acres at Grasse and Cannes for perfume. Many other interesting plants were mentioned, but want of space prevents mention of them. The lecture was illustrated with a selection of Riviera flowers.

CRYSTAL PALACE.

March 25.—A very fine display of spring flowers was to be seen at the Crystal Palace on Saturday last. There was an unusually keen competition in the several classes, especially in those for bulbous plants. Unlike last year, the spring show is to be the forerunner, we hope, of an interesting series of exhibitions, and it is satisfactory to find them again restored.

Hyacinths, Tulips, and other bulbous plants were the finest feature, but the flowers are not remarkable this year. Mr. Jas. Douglas, gr. to Mrs. Whitbourne, Great Gearies, Ilford, was a successful competitor. He was a good 1st for thirty-six Hyacinths, the spikes showing good culture; Messrs. H. Williams & Son, Fortis Green, Finchley, 2nd; Messrs. B. S. Williams & Son, Upper Holloway, 3rd. There were five competitors, very creditable for a spring show. In the corresponding class for Tulips, Mr. Douglas was again 1st, the flowers very clean, large, and varied. We may mention that the varieties Joost van Vondel, Proserpine, Duchesse de Parma, Rose of Holland—white feathered with rose, and Keizer's Kroon well deserve a note. The order was reversed as to the other places, Messrs. B. S. Williams & Son being 2nd. A good show was made by Mr. Jas. Douglas in the class for twenty-four pots of Polyanthus Narcissus, the plants very compact; whilst for twenty-four Daffodils Messrs. H. Williams & Son were 1st. One of the most interesting features was the class for twelve pots of Lily of the Valley, and the twelve plants shown by Mr. T. Jannoch, Dersingham, King's Lynn, Norfolk, were a mass of bloom, compact, and remarkably well grown; Messrs. H. Williams & Son, 2nd. Cyclamens were a feature of importance, the plants very fine, especially the thirty-six from Mr. Thos. Pestridge, Boston Road Nursery, Brentford; the St. George's Nursery Co., Hanwell, 2nd; and Mr. May, Gordon Nursery, St. Margaret's, Twickenham, 3rd. In the class for twelve, the 1st prize went to Mr. W. Slogrove, Gatton, Reigate; and Mr. John Hughes, gr. to G. R. Higgins, Esq., 2nd.

Chinese Primulas were in good character from Mr. Ford. Cinerarias were extensively shown. Mr. Jas. Ford, gr. to Sir C. Pigott, Bart., Wrexham Court, Slough, was 1st, for twelve plants, all remarkably well-flowered.

There was close competition in the class for eighteen pots of Mignonette, the 1st prize going to Mrs. A. H. Morle, who had very compact plants, well-flowered; Mr. A. White, Stanmore Park Gardens, Stanmore, 2nd.

Messrs. Paul & Son, Cheshunt, were 1st for twelve Amaryllis, the specimens of fine culture; and Mr. James Douglas, 2nd; whilst in the amateur classes for bulbs, as twelve Hyacinths, Tulips, and so forth, Mr. H. Shoesmith, gr. to M. Hodgson, Esq., Shirley Cottage, Croydon, was the most successful; Mr. F. Batt, West Norwood, a good 2nd; but we may mention that Mr. James Gibson, gr. to Mrs. Berkeley James, The Oaks, Carshalton, had the best twelve Narcissus.

Not the least important feature of the show was the group of twenty-four Azaleas from Mr. Robert Wells, Longton Nursery, Sydenham, which won the 1st prize; such varieties as Camille Vervaene, bright rose-purple; Comtesse de Flandre, rose; and

Madame Bafinger, white, and tinted with lemon at the base, were of note.

Three competed in the class for a group of miscellaneous plants, the 1st prize being awarded to Messrs. J. Laing & Sons, Forest Hill, S.E., for a fine arrangement, comprising Cliveias, and such Orchids as Cypripedium Elliottianum, Cymbidium Lowianum, and fine-foliaged specimens.

Messrs. J. Peed & Sons, Roupell Park Nursery, Norwood, S.E., were 2nd, but their group was too lumpy, although consisting of fine plants.

Miscellaneous collections were numerous and interesting. The Cyclamen was, as usual at this season, the principal flower, and a large collection came from the St. George's Nursery Company, Hanwell. It was the finest group we have seen, finer even than at the Royal Botanic Show on the previous Wednesday. An excellent group also came from Mr. Thos. Pestridge; and amongst other miscellaneous contributions may be named a collection of varieties of Primula Sieboldi from Messrs. Ryder & Son, Sale, Manchester. This firm always exhibits tastefully, the flowers appearing to advantage rising from a surface of green moss, also pleasing table adornments.

Messrs. Wm. Paul & Son, Waltham Cross, had several boxes of Camellia flowers, representing a choice collection of varieties; one seedling, unnamed, having a large flower of a fine rose-colour; also a group of new Roses, a very interesting display. Such exhibits as these are the life of a show.

A large group of Lily of the Valley from Mr. T. Jannock, showed how well this grower cultivates this familiar flower.

Messrs. Paul & Son, Cheshunt, had Lilacs in pots, and Roses. Pauls' Early Blush is apparently a beautiful novelty, the flowers of good form, very sweetly scented, and of a pleasing rose colour. It will prove, we think, a favourite, but it is difficult to judge a new Rose from a plant at an exhibition. Hardwooded plants were shown well by Messrs. W. Cutbush & Son, Highgate; and dinner-table plants by Messrs. J. Peed & Sons. A very charming exhibit was two basketsful of Violets from Mr. W. Slogrove; and a large collection of Mushrooms, packed for market, came from Mr. Hardy, Ash House, Parson's Green.

Foreign Correspondence.

PRETORIAN PLANTS.

Trichodesma angustifolium.—Named and figured by Harvey more than thirty years ago in his *Thesaurus Capensis*, t. 40, this interesting plant came under my notice lately. A herb, 18 inches high, with many spreading stems and narrow rough leaves. Roots tuberous. Flowers borne in racemes, blue and red in colour, half an inch across, reminding one of Comfrey. Not such a showy plant as Trichodesma physaloides, yet worthy of note.

Gazania pygmæa.—Seed of this has been sent to Mr. Max Leichtlin, who pronounces it to be a new species. A very pretty little dwarf plant, hardly 6 inches high, and blooming in early spring in dry loamy soil. Flowers pure white, rather more than an inch across; leaves long and narrow, not lobed. It will probably make a fine bedding or border plant.

Dombeya rotundifolia.—A shrub, 10 feet high; a mass of snow-white flowers in early spring, before the leaves have expanded, when it is a very showy object.

Helichrysum cæspititium.—Surely the most humble of its race, appearing like patches of snow on dry hill sides in early spring. Flowers white, very small, and closely set, almost hiding the small Heath-like leaves, which form a green, moss-like cushion. A very pretty object for a rockery.

Erythrina Zeyheri.—In its wild unprotected state hardly a foot high, but shrubby when cultivated, and it then sends up a spike, about 2 feet long, of the most splendid crimson flowers.

Celastrus buxifolius.—Only attractive when in bloom; at other times it is a most formidable plant, armed with very long sharp spines. In early summer the rigid shoots are clothed with thousands of small ivory-white flowers, very sweet-scented, and attractive to bees and flies. A good hedge plant.

Lyperia multifida.—One of the Scrophulariaceæ. A herb some 6 inches high, bearing very many rosy flowers like a miniature Achimenes, and growing in company with a blue Lobelia, literally painting the veld with bright colours in October just before the grass begins to shoot.

Vellosia equisetifolia.—Imagine a stout Dracæna-like stem 2 feet high, crowned with long drooping grass-like leaves, interspersed with many solitary pendents, pale and blue Zeyphranthes-like flowers, 4 inches across. No one at first sight would take this fine plant to be an Amaryllid, since root, stem, and leaves have the habit of a Dracæna. It is a very rare plant in Natal and the Cape, and only found here in the driest and most rocky places, at great elevations, generally about 6000 feet. About six years ago, I collected a quantity of seed of this plant, and sent it to Prof. McOwan of the Cape Town Botanic Gardens, who in turn forwarded it to Kew. It is a plant that transplants very badly.

Gomphocarpus.—Of these beautiful and interesting Asclepiads, of which we have many species, G. eminens is a many-stemmed herb, with green and white flowers, and a remarkable ascending corona. Another species has large very handsome creamy-white flowers, 1¼ inches across. The corona is marked with deep maroon or rosy spots. It is a beautiful plant, well worthy of cultivation. And another bears a compact umbel of a dozen greenish flowers, most strongly honey-scented. The seed-vessels of these species are wonderfully varied, and are a study in themselves. *R. W. Adlam, Pretoria, Transvaal.*

Obituary.

Alexander McKenzie.—We regret to hear of the death, on the 27th ult., of Mr. A. McKenzie, the bailiff of Epping Forest. Alexander McKenzie, who was in his sixty-fifth year, was a native of the north of Scotland, and commenced his gardening career on the Deeside, Aberdeenshire, having been apprenticed in the gardens of Learney, subsequently he went to Fife, where he married. Eventually coming to England, he established himself in the nursery business for a short time at Brighton, and it was during that time that there arose between him and Mr. Thomson, of Clovenfords, a question as to who could produce the better Grapes during the month of January. From the Tweed Nurseries old Grapes were sent, while McKenzie showed newly-grown bunches, but the general result of the contest was a draw.

Giving up the nursery business, McKenzie again went into a gentleman's garden in the neighbourhood of London, whence he went to the Alexandra Palace, the grounds of which place were laid out by him; and among other places which he had to lay out, in association with Mr. Merston, was the Victoria Embankment Gardens. Shortly after the completion of these works, he was appointed Bailiff under the Corporation of London for Epping Forest and Burnham Beeches, which position he held till his death, which took place at The Warren, Epping. At City meetings and functions Mr. McKenzie was a familiar figure, and he had for some years been known publicly as Major in the Honourable Artillery Company. He was a zealous supporter of the Gardeners' Royal Benevolent.

Mr. William Treseder, the well-known Cardiff nurseryman, died at his residence in the Cowbridge Road, Cardiff, on the 22nd ult. The deceased gentleman was highly respected by all who had dealings with him, and has for the past forty years been the leading florist and nurseryman in the neighbourhood of Cardiff. The funeral, which took place on the 27th ult., was largely attended by the gardeners and nurserymen of the district, and also by a great number of the older residents of the town.

Threatened Extermination of the Alligator.—We learn from the *Bulletin de l'Association pour la Protection des Plantes*, that the high market value now set upon the skin of the alligator or cayman, causes the creature to be so recklessly hunted down that it is likely shortly to become extinct in Southern and Central America. To obviate such a contingency, the Government of Florida has recently passed a law protecting the alligator for three years, and threatening with severe penalties all who may molest it during that "close" time. It is added that this regulation is not passed in the interests of science, but from economical motives. The alligators feed on rats and other vermin, which, if not thus kept in check, would soon destroy the harvests, and ruin the agriculturists.

The Weather.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees — a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Districts.	Temperature. Above (+) or below (−) the Mean for the week ending March 25.	Temperature. Accumulated. Above 42°, for the Week.	Below 42°, for the Week.	Above 42°, difference from Mean since January 1, 1893.	Below 42°, difference from Mean since January 1, 1893.	Rainfall. More (+) or less (−) than Mean for the Week.	No. of Rainy Days since Jan. 1, 1893.	Total Fall since Jan. 1, 1893.	Bright Sun. Percentage of possible Duration for the Week.	Percentage of possible Duration since Jan. 1, 1893.

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.: 3, England, E; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

The following summary record of the weather for the week ending March 25, is furnished from the Meteorological Office:—

"The *weather* during the week was extremely fine, bright, and dry over the whole of the kingdom. In London, however, the sun was frequently obscured during the early part of the day by low fog or haze.

"The *temperature* during the daytime was very high for the time of year, low at night; the diurnal range during the latter part of the period was unusually large, amounting to between 40° and 42° at some of the central English stations. The average for the week was only a little in excess of the normal over eastern, southern, and central England, but exceeded it by 4° over the northern counties, and by 4° or 5° in most parts of Ireland and Scotland. The highest of the maxima (which were recorded either on the 24th or 25th) ranged from 63° in 'Scotland, W.,' and 64° in 'Scotland, N.,' to 69° in 'England, E.,' the 'Midland Counties,' and 'England, S.W.' The lowest of the minima occurred at most stations at the beginning of the period, when they ranged from 17° in 'Scotand, E.,' and 19° in 'Scotland, N.,' and the 'Midland Counties' to 32° in 'Ireland,' and to 38° in the 'Channel Islands.'

"The *rainfall* was entirely absent from the greater part of the kingdom, the only exceptions being some localities in the west and north of Ireland, and the north and east of Scotland, where some small amounts were measured either at the beginning or end of the week.

"The *bright sunshine* was unusually prevalent, and greatly exceeded the mean. The percentage of the possible duration ranged from 36 to 66 in Scotland, from 52 to 60 in Ireland, and from 62 to 82 in the English districts; in the Channel Islands the percentage was as high as 91. These weekly percentages are in nearly all districts far higher than any previously recorded in the month of March since the sunshine recorders were first established in 1881; that for the Channel Islands is higher than any hitherto obtained during any part of the year."

Answers to Correspondents

Asters Diseased: *J. G.* We cannot see any trace of fungus. Can the mischief have arisen from watering when the plants were exposed to the sun?

Books: *R. M. Tobacco, a Handbook for Planters*, by C. G. Warnford Lock, and published by E. & F. N. Spon, Strand, London, price a few shillings. Messrs. Carter, of High Holborn, conducted some experiments a few years ago, and issued a pamphlet which might be useful to you.

Carpet Bedding, &c.: *X.* You will find what you want in *Cassell's Popular Gardening*, now being re-issued in monthly parts.

Chrysanthemums for Training: *A. G. B.* Answered in Home Correspondence column.

Detached Hyacinth Spikes: *F. N.* For some reason or other, which we cannot explain, the flower-spike grows too fast, and the enveloping bulb scales do not yield in unison. The consequence is, the scales by not expanding constrict the flower-spike, and, as it were, pinch it off.

Manure for Grass Land: *R.* The continuous application to a pasture of any kind of forcing manure, whether natural or artificial, is certain to cause the coarse, gross-feeding, and deeply rooting species to get the upper hand, and to drive out those of finer and better quality. If farm-yard manure has been applied in any considerable quantity during recent years, stop the application altogether, and give a dressing of 5 cwt. basic slag, and 2 cwt. kainit-salt per acre at once. This mixture will be cheap, and will supply in the slag, phosphoric acid, and lime, and in the kainit, potash, magnesia, and sodium chloride (common salt), but no nitrogen. It is the nitrogenous constituents in a manure that more particularly favour the stronger growing Grasses. Fish manure would supply nitrogen and phosphate of lime. It would be better adapted for meadows that have to be mown for hay, than for pastures intended for grazing. A bone superphosphate applied at the rate of from 2 to 3 cwt. per acre might permanently improve a pasture that had previously been treated with farm-yard dung. *J. J. W.*

Names of Plants: *H. Y.* 1, Prunus Pissardi; 2, Prunus triflora.—*T. W.* 1, Kerria japonica; 2, Hepatica triloba, double-flowered; 3, Saxifraga cordifolia; 4, Adiantum Farleyense; 5, Cotyledon.—*T. D.* Gynura aurantiaca.—*D. R., Edinburgh.* 1, Odontoglossum triumphans; 2, Bifrenaria Harrisoniæ; 3, Brassavola Perrinii; 4, Anthurium margaritaceum; 5, Rudgea macrophylla.—*S.* Oncidium trulliferum, the yellow, and Epidendrum lanipes.—*T. H. Moffat.* Next week.

Removal of Fruit Bushes, &c.: *F. W. W.* If you are not a nurseryman you cannot legally remove the bushes without permission, neither can you do so if you are in the service of your landlord. We do not think you could claim compensation from the incoming tenant. Try and arrange matters with the landlord, and if you cannot come to terms then consult a solicitor.

Rose Pruning: *A. M.* As a general rule, it is best to prune the weakly shoots hard back. We agree with you, rather than with the lecturer, but perhaps you misunderstood him. Was he alluding to Tea Roses? which, though weakly, do not require hard-pruning.

Scilla bifolia: *T. Smith.* They are attacked by a fungus Ustilago Vaillantii, Tul. I think this must be the first British record of the species. *M. C. Cooke.*

PATENT
SILICATE MANURE.

Dress Your Early Vines with it now.

"Maidstone, *August* 13, 1892.

"We used it on our Vines, and, although we had prepared them with other stimulants last season, we attribute the best crop we have ever had to the use of your Manure—the berries are grand.

"(Signed) GEO. BUNYARD & CO."

PRICES IN SACKS, AT WORKS—
10s. per Cwt.; £2 per ¼-Ton; £3 15s. per ½-Ton; £7 per Ton.

Address—THE CHEMICAL WORKS,
HEMEL HEMPSTEAD, HERTS.

BEESON'S MANURE.

Has now been universally used in all the principal gardens for over twenty years, and has proved the Best and Cheapest Fertiliser for Vines, Plants, Vegetables, and all purposes. With the aid of entirely new machinery, it is now being sent out in splendid condition. Write for Circular containing the leading gardeners and market growers reports. Sold in tins at 1*s.*, 2*s.* 6*d.*, and 5*s.* 6*d.* and 10*s.* 6*d.* each; also in 1 cwt. bags, sealed, 13*s.* each, by all Seedsmen; or apply direct. 1 cwt. and above is sent carriage-paid for cash with order, and special terms for large quantities. Directions for use are placed in each bag, and printed on tins.

W. H. BEESON,
CARBROOK BONE MILLS, SHEFFIELD.

VIGOR'S
"PERFECT"
GARDEN
MANURE.

CLEAN and EFFECTUAL.

Scientifically prepared to contain all the constituents necessary for promoting the most Luxuriant Growth of Flowers, Fruits, and Vegetables.

Sold in Tins, at **1s., 1s. 6d.**, and **2s. 6d.**; and in Bags, 28 lb., **6s. 6d.**; 1 cwt., **21s.** Carriage Paid.

VIGOR & CO.,
120, MARYLEBONE ROAD, LONDON, N.W.
Works:—KENT and NORFOLK.

NATIVE GUANO.—Best and Cheapest Manure for Garden Use. Price £3 10*s.* per ton, in bags. Lots under 10 cwt., 4*s.* per cwt.; 1 cwt., Sample Bag, sent Carriage Paid to any Station in England, on receipt of P.O. for 5*s.*

Extracts from 16th Annual Collection of Reports:—

NATIVE GUANO, for POTATOS, VEGETABLES, &c.

H. Brinkworth, Potato Grower, Reading, used for Potatos, Onions, and Carrots, results:—"Very good; never had better crops."—J. Butler, Sittingbourne:—"Used for Potato, Celery, and other Market Garden Crops, with very good results; Potatos large, clean, and free from disease. Best and Cheapest Manure in the Market."

NATIVE GUANO, for FRUIT, ROSES, TOMATOS, &c.

J. Peed & Sons, Streatham, used for Fruit Trees and Roses, results:—"Very satisfactory; we use no other Guano now; consider yours preferable to Peruvian."—J. Finch, Orrell Gardens:—"Used for Vegetables, Tomatos, Grapes, Cucumbers, and Flowers, with satisfactory results. Most excellent for Potatos, and many other things. The Cheapest Manure in the Market."

Orders to the **Native Guano Co., Ltd.**, 29, New Bridge Street, Blackfriars, London, where Pamphlet of Testimonials, &c., may be obtained. AGENTS WANTED.

BONES! BONES!! BONES!!! Any size from dust to 1 inch. Dissolved Bone Compound, for Top-dressing. All at 10*s.* per cwt.; less quantity, 1½*d.* per lb. Carriage paid on 1 cwt. Terms, Cash with Order. Special quotations for large Buyers.

E. S. WILES and CO., Bone Crushers, St. Albans.

C. BEESON'S MANURE.—The best Fertiliser for all purposes. Demand increasing weekly. One trial will prove its value. Pure Bones any size, raw or dissolved, 8*s.* per cwt. Write for particulars.

C. BEESON, The Bone Mills, St. Neot's, Hunts.

"SLUGICIDE," Registered.—Certain death to Slugs, fertiliser to soil, perfectly harmless to plants and domestic animals. The greatest boon to Gardeners yet invented. 1*s.* 6*d.* per box, of Seedsmen, or post paid of THE "SLUGICIDE" CO., 6, Maryleport Street, Bristol.

RICHARDS' WEED DESTROYER

Every Gallon Guaranteed above the usual Standard Strength.

As at Present Used in the ROYAL GARDENS.

☞ **PREPARED IN LONDON IN THE LARGEST POISON MANUFACTORY IN EUROPE.**

Full Directions for Use printed on each Package. To be used in the proportion of 1 gallon to 25 gallons of water.

In strong Drums of 2 gallons, **3/8**; 4 gallons, **7/-**; 6 gallons, **10/-**. In Casks, 12 gallons, **18/6**; 18 gallons, **27/-**; and barrels, 40 gallons, **50/-**.

Special Quotations Given for Large Quantities.

Six Gallons or more sent Carriage Paid to any part.

Full Invoice Price allowed on Empties, when returned in good condition carriage paid.

The reports from Customers who have used it during the past year (and tried it side by side with others), afford ample proof that it is the QUICKEST IN ACTION and the most PERMANENT WEED KILLER in the Market.

AUTOMATIC DAMPER
FOR GREENHOUSES.
Dr. GEORGE WALKER, Inventor of Chrysanthemum Cup Tubes, Wimbledon, says:—"I have used your Automatic Damper for some weeks, and am perfectly satisfied with it. A most ingenious and useful invention."
Mr. H. J. JONES, Hither Green, Lewisham, who uses the Damper in a house 100 feet long, says:—"I find this damper is in every way economical. Its saves both fuel and labour, and keeps the house at a more even and better temperature."

Gardeners and others Wanting Situations. 26 *words, including name and address,* 1*s.* 6*d.*, *and* 6*d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.*

Births, Deaths, and Marriages, 5*s. each insertion.*

Notice to Advertisers.—*In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.*

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

Position.—*Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.*

Postal Orders.—*To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No.* 42, *DRURY LANE, to* A. G. Martin, *as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.*

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week must *reach the Office not later than Thursday noon.*

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, Wellington Street, Strand, W.C.

ALL KINDS.

Testimonials.

"Shirburn Castle, January 5, 1890.

"Sir,—As you requested my opinion of the houses which you erected for me some 4 years ago, I beg to inform you that I consider them a perfect success, and I have recommended them to many of my neighbours.—Yours truly (signed) Macclesfield."

"Hornby Castle, Lancaster, February. 1890.

"Major Foster has much pleasure in stating that the vineries and forcing-houses which were erected by Mr. Helliwell in 1884, continue to give perfect satisfaction, both to himself and his gardener."

"Estate Office, Ripley, Yorkshire, January 23, 1890.

"Sir Henry Ingilby has much pleasure in stating that the glazing work executed by you, under your patented system, at the Ripley Castle Gardens, has been in every respect entirely satisfactory. The work has stood its 8 years' wear and tear extremely well, and has hitherto cost nothing to keep it in repair."

MARKETS.

COVENT GARDEN, March 29.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

THE fine weather is sending heavy supplies of forced goods into market, particularly Cucumbers and Strawberries, which are only cleared at much reduced rates. *James Webber, Wholesale Apple Market.*

POTATOS.

Trade still continues very quiet, and prices low for all kinds except first-class samples.

NEW POTATOS.—Arrivals this week rather heavy, best samples making 26*s.* to 28*s.*; medium, 20*s.* to 22*s.*; ordinary, 14*s.* to 16*s.* *J. B. Thomas.*

SEEDS.

LONDON: *March* 27.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write, that a good sowing demand now prevails for field seeds. Quotations generally exhibit extreme steadiness. Choice English Cow-grass offers less freely. Alsyke White and Trefoil are unchanged. Perennial Rye-grasses seem inclined to be cheaper. French Italian continues scarce and dear. The supplies of Sanfoin appear nearly exhausted. Kœnigsberg and Brunswick Tares move off freely. In bird seeds there is now but little business passing. White and Scarlet Runner Beans offer on remarkably moderate terms.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending March 25, and for the corresponding period last year:—1893: Wheat, 24*s.* 8*d.*; Barley, 25*s.* 5*d.*; Oats, 18*s.* 3*d.* 1892: Wheat, 32*s.* 8*d.*; Barley, 27*s.* 9*d.*; Oats, 20*s.* 4*d.*

FRUITS AND VEGETABLES.

BOROUGH: *March* 28.—Fully adequate supplies, which meet a quiet demand. Kale, 9*d.* to 1*s.* 3*d.* per bushel; Turnip-tops, 2*s.* to 2*s.* 6*d.*; Broccoli, 1*s.* 9*d.* to 2*s.* per bag; Greens, 1*s.* 6*d.*; Parsley, 3*s.*; Carrots, 2*s.* 6*d.* to 3*s.* 6*d.*; Turnips, 1*s.* 6*d.* per dozen bunches; English Onions, 8*s.* to 9*s.* per cwt.; Dutch do., 6*s.* per bag; Horseradish, 2*s.* 3*d.* to 2*s.* 6*d.* per bundle Apples, 4*s.* 6*d.* to 6*s.* per bushel.

SPITALFIELDS: *March* 28.—Supplies of greenstuffs continue good. Fair demand. Prices:—Savoys, 3*s* to 5*s.*; Cauliflowers, 5*s.* to 7*s.* 6*d.* per tally; Curly Kale, 6*d.* to 1*s.*; Beetroots, 3*s.* to 4*s.* per bushel; Sea-kale, 1*s.* to 1*s.* 3*d.* per punnet; Brussels Sprouts, 1*s.* per half-sieve; Turnip tops, 2*s.* to 2*s.* 6*d.*; Sprouting Broccoli, 1*s.* 6*d.* to 2*s.* 6*d.* per sack; Greens, 1*s.* 6*d.* to 2*s.*; Carrots, 2*s.* to 3*s.*; Turnips, 2*s.* to 2*s.* 6*d.*; Parsley, 6*s.* to 9*s.* per dozen bunches; Horseradish, 2*s.* to 2*s.* 6*d.*; Celery, 1*s.* 3*d.* to 1*s.* 6*d.* per bundle; forced Rhubarb, 1*s.* to 1*s.* 6*d.*; natural do., 2*s.* 6*d.* to 3*s.*; Mint, 5*s.* to 6*s.* per dozen bundles; frame Cucumbers, 5*s.* to 7*s.* per dozen; Mustard and Cress, 2*s.* per dozen baskets; English Onions, 9*s.* 6*d.* to 10*s.* 6*d.* per cwt.; Spanish do., 9*s* to 10*s.* per case; foreign Tomatos, 1*s.* 6*d.* to 2*s.* per box; English Apples, 5*s.* 6*d.* to 6*s.* 6*d.* per bushel; American do., 18*s.* to 19*s.* per barrel.

FARRINGDON: *March* 29.—Quotations:—English Onions, 10*s.* per cwt.; Parsnips, 40*s.* per ton; Turnips, 40*s.* to 45*s.* do.; Carrots, 50*s.* to 60*s.* do.; Broccoli, 1*s.* 6*d.* to 1*s.* 9*d.* per bag; Turnip-tops, 1*s.* 6*d.* to 1*s.* 9*d.* do.; Greens, 1*s.* per bushel; Radishes, 8*d.* per dozen bunches; Apples, French, 9*s.* per box; American Baldwins, 13*s.* to 15*s.* per barrel; Pine-apples, 2*s.* to 2*s.* 6*d.* each.

POTATOS.

BOROUGH: *March* 28.—Quotations:—English Magnums, 40*s.* to 80*s.* per ton. Others as last reported.

SPITALFIELDS: *March* 28.—Quotations:—Magnums, 40*s.* to 70*s.*; Champions, 45*s.* to 60*s.*; Imperators, 50*s.* to 65*s.* per ton.

FARRINGDON: *March* 29.—Quotations:—Main Crop, 85*s.* to 90*s.*; Sutton's Abundance, 75*s.* to 85*s.*; Bruce's, 65*s.* to 70*s.*; Magnums, 55*s.* to 65*s.* per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80*s.* to 115*s.*; do., inferior, 70*s.* to 75*s.*; hay, best, 75*s.* to 112*s.*; do., inferior, 65*s.* to 75*s.*; and straw, 30*s.* to 45*s.* per load.

HOLLOWAY'S PILLS.—The Great Need.—The blood is the life, and on its purity depends our health, if not our existence. These Pills thoroughly clean e this vital fluid from all contaminations, and by that power strengthen and invigorate the whole system, healthily stimulate sluggish organs, repress over-excited action, and establish order of circulation and secretion throughout every part of the body. The balsamic nature of Holloway's Pills commends them to the favour of debilitated and nervous constitutions, which they soon resuscitate. They dislodge all obstructions, both in the bowels and elsewhere, and are, on that account, much sought after for promoting regularity of action in young females and delicate persons who are naturally weak, or who, from some cause, have become so.

GREEN'S PATENT "SILENS MESSOR" AND "NEW MONARCH"
ROLLING AND COLLECTING MACHINES FOR 1893.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in **constant** *use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.*

They are the first, foremost, and best in the world.

Patronised by—
HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS.
The Late EMPEROR OF THE FRENCH. The EMPEROR OF RUSSIA,
And most of the NOBILITY, CLERGY, and GENTRY of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "*Journal of Horticulture*," of June 9, says: "MOWING MACHINES.—After a critical examination, the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished it is quite unnecessary to give any description of them."

Upwards of 195,000 of these Machines have been Sold since they were first introduced in the year 1856,
And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.
They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

SINGLE-HANDED SILENS MESSOR LAWN MOWER,
With Improved Steel Chains and Handles.

ACRES OF BULBS.—Many varieties now in full splendour of bloom. Specimen Blooms sent for selection of sorts if desired.

DICKSONS NURSERIES, CHESTER.

THE MOST SUITABLE FOR

SHADING ORCHIDS, FERNS, Palms, and Stove and GREENHOUSE PLANTS.

WILLIAMS' HOTHOUSE SHADING.

It is a strong, durable Cotton Netting, woven in squares so close as to exclude the direct rays of the sun, but admitting the greatest amount of light attainable through shading.

It withstands the weather better than any other class of Shading, and may be beneficially used on account of the thickness of its texture, during cold weather, to keep the frost out. The leading Orchid and Plant Growers in the country have used this material for some years, and speak very highly of it, pronouncing it to be the very best material for Plants they have ever used.

Blinds made up and fixed complete.

Sold in pieces, 30 yards long by 1½ yard wide. Price 40*s.* each. Samples submitted gratis.

FLORISTS' FLOWERS, a Specialty.—My Superb Collections of Antirrhinums, Auriculas, Begonias, Carnations, Dahlias, Delphiniums, Fuchsias, Gaillardias, Pæonies, Pansies, Pelargoniums, Pentstemons, Petunias, Phloxes, Pinks, Potentillas, Pyrethrums, Violas, Hardy Border and Herbaceous Plants, &c., are the grandest ever brought together. They have been awarded numerous Certificates and Gold, Silver, and Bronze Medals, by the leading Horticultural Societies in the kingdom, with emphatic eulogiums by the Press, and my Illustrated Catalogue of them for 1893, 134 pages, which should be carefully perused by all before ordering elsewhere, is the largest, most comprehensive, and most reliable ever issued on Florists' Flowers and Hardy Plants. It has been posted to my Patrons, who will please oblige by informing me if any have miscarried, when I shall be happy to post another copy, free on application.

JOHN FORBES, Hawick, Scotland.

ALL MUST HAVE

THE LATEST NOVELTY IN CHRYSANTHEMUMS—

"CHARLES DAVIS,"

The most magnificent Chrysanthemum in existence. Golden sport from the immensely popular Viviand Morel. Canary-yellow, most beautifully tinted rosy-bronze.

H. J. JONES has great pleasure in announcing that he has concluded the purchase from Mr. N. Davis of one-half of the entire stock, estimated at about 500 plants, which will be ready early in May. Though late in the season to introduce this novelty, it is of such a free-flowering nature that good exhibition blooms can be secured from these plants, but as some will necessarily come ready before others, early Orders will receive the best plants.

Price 6s. each; 3 for 15s.; 6 for 27s. 6d.

No further trade reduction from these prices. Orders will be executed in rotation, and in case of insufficiency of stock, Cash Orders will receive priority.

SHEPPERSON'S NOVELTIES and SPECIALTIES (THIRTY-FOURTH YEAR OF ADVERTISING).

The following Novelties and Specialties, having all been grown in a very exposed situation high up on the Derbyshire hills, are very hardy, stocky, and healthy, very different to weak seedlings grown in warm favoured situations which look nice, but very rarely succeed well. All carriage free for cash with order. Descriptive List free.

CHRYSANTHEMUMS (Special Culture).—Not a collection of old-fashioned sorts, but the cream only of the best English, French, American, and Japanese raisers, including the very latest novelties; good well-rooted plants, 12 for 2s.; 25 for 3s. 6d., warranted true to name; 12 selected extra varieties, all new, of 1891 and 1892, for 4s.

PANSIES (a great specialty).—Five Silver Cups and other prizes, the cream only of the most noted raisers, the latest new sorts and the winners at all the great shows; good plants, correctly named, show or fancy, 12 for 3s.; 25 for 5s. 6d.; 50 for 10s. 6d.; 100 varieties, 20s.; also seed, 1s. and 2s. 6d. per packet.

DORONICUMS (Golden Stars or Hardy Marguerites).—Three distinct first-class sorts—Harpur Crewe, Clusi, and Plantagineum excelsum, 1 each for 1s. 6d.; 2 for 2s. 6d.

CARNATIONS, PICOTEES, and CLOVES of the finest named hardy border varieties; many grand new sorts; strong layers, wintered outside, 6 for 2s. 6d.; 12 for 4s.; 25, in twelve varieties, for 7s. 6d.; also seed from above splendid collection, 1s. and 2s. 6d. per packet.

PHLOXES (Perennials).—Special culture of early and late varieties; the cream only from Downie, Laird & Sons, Kelway, Ware, and other first-class growers; 6 fine varieties, 2s.; 12 for 3s., true to name; strong stools to bloom well.

GEUMS.—The new double Scarlet, a splendid hardy free-blooming plant, and fine for cutting; strong two-year-old plants, 12 for 1s. 6d.; 25 for 2s. 6d.; 100, 9s.

CANTERBURY BELLS.—Grand new colours and new forms, double and single Telescopes, Hose-in-Hose, Cup and Saucer, and other varieties; 12 plants to bloom well, 1s. 6d.; 25 for 2s. 6d.; 100, 9s.; also seed, 6d. and 1s. per packet.

VIOLAS, during the last few years, have come to the front as few flowers have ever done; they are wanted everywhere, and very few plants produce so fine a display for so little trouble. I have a grand collection, including many new varieties; 12 varieties, named, 2s.; 25 for 3s. 6d.; 100, 12s.; seed, 1s. per packet.

12 Pure Snow-white Garden PINKS, sweetly scented, 1s. 6d; 25 for 2s. 6d.; 100, 9s.

NEW WHITE BORDER PINK, Her Majesty (Ware).—Flowers very full, very large, and remarkably strong; constitution pure white and fragrant; has received a large number of first-class certificates; a really grand new variety; 2 for 1s. 6d; 3 for 2s.; 6 for 3s. 6d.

12 Beautifully Spotted or Pure White FOXGLOVES for 1s. 6d.; 25 for 2s. 6d.; 100, 9s.

NEW HARDY JAPANESE PRIMULAS (Hybrids of Primula Sieboldi).—This new class of hardy Primula, which has become so popular either for the outside border or the greenhouse; since its introduction it has been greatly improved, the new varieties being really grand. The following collection is the production of Mr. Geggie, the celebrated raiser, whose collection has gained first prizes, gold medals, and first-class certificates at the Crystal Palace, Royal Horticultural, Royal Botanic, and other important societies; 6 distinct varieties, named, 3s.; 12 for 5s.

AURICULA (Alpines).—A splendid collection, the result of many years' careful selection; strong plants, to bloom well, very different to untried seedlings, 12 for 3s.; 25 for 5s. 6d.; seed, 1s. per packet.

ASTERS (MICHAELMAS DAISIES).—Unrivalled hardy autumn-flowering border plants, and for cut flowers; a grand collection of the latest improved colours, as pure white, pink, bright mauve, &c.; 6 distinct sorts for 1s. 6d.; 12 for 2s. 6d.; 25, in twelve varieties, 4s. 6d.

CARNATIONS, PICOTEES, and CLOVES.—Strong year-old plants, seedlings from the finest named varieties, will produce 80 per cent. of fine double flowers of the very best colours only, such as white, pink, scarlet, crimson, purple, yellow, striped, spotted, &c.; 12 varieties, 2s. 6d.; 6 for 1s. 6d.; 100, 15s.

MALVA MOSCHATA.—Pink and white, hardy border plants, grand for cutting, 1s. 6d. per dozen; 25 for 2s. 6d.; 100, 9s.

POPPIES have now made their way to the front, and none are so popular as the hardy perennial varieties Nudicaule and Orientalis, free and continuous flowering, and bright striking colours; 6 for 1s. 6d.; 12 for 2s. 6d.; 25 for 4s.

GAILLARDIAS (Perennial hybrids).—A really grand collection of these most gorgeously-marked hardy plants, colours scarlet, crimson, and gold of different shades; blooms all the summer; 6 for 1s. 6d.; 12 for 2s. 6d.; 25 for 4s.

PYRETHRUMS (Double and Single).—A grand collection to name, selected from the best English and French raisers; as a hardy, free-flowering, easily-grown plant for all purposes, the Pyrethrums are among the very best; 3 named varieties, 1s. 6d.; 6 for 2s. 6d.; 12 for 4s.

CARNATION MARGUERITE.—This grand novelty has proved itself to be the most remarkable of all the Carnation family; it commences blooming early in summer, and goes on till late autumn; it will produce quite 80 per cent. of fine double flowers of the most beautiful colours and markings; 12 for 2s.; 25 for 3s. 6d.

AURICULA (Alpina), the real old Irish Dusty Miller.—A most beautiful hardy, easily-grown, sweetly-scented, free-flowering variety; 6 strong plants, 2s.; 12 for 3s.; 100, 20s.

IRIS GERMANICA.—Rivals of the famed Orchid flowers, of peculiar formation, and most exquisitely marked with many bright and distinct colours; quite hardy; 3 named varieties for 1s. 6d.; 6 for 2s. 6d.; 12 for 4s.

POLYANTHUS & PRIMROSE HYBRIDS.—Splendid mixed colours; finest strain grown; 12 for 1s. 6d.; 25 for 2s. 6d.; 100 for 9s.; all good hardy blooming plants; also seed, 6d. and 1s. per packet.

DELPHINIUMS.—A splendid lot raised from twelve new varieties of Kelway's double and single, including Lord R. Churchill, Melton, James Kelway, and others; good plants, to bloom well, 6 for 2s.; 12 for 3s.; 50 for 10s.; also seed, 6d. and 1s. per packet.

PRIMULA CASHMERIANA.—A really fine spring-flowering plant, colour bright mauvy-violet; free bloomer; should be in every garden; 3 for 1s. 6d.; 6 for 2s. 6d.; worth double.

CAMPANULA PERSICIFOLIA.—Single white, double white, double blue, and grandiflora. All quite hardy and unrivalled for border decoration, cut flowers, wreaths, &c.; 1 of each for 1s. 6d.; 2 of each for 2s. 6d.

ARABIS ALBIDA VARIEGATA.—A splendid variegated variety for the rockery or front rows, to beds and borders; flowers pure white; 6 for 1s. 6d.; 12 for 2s. 6d.

12 HARDY PERENNIAL BORDER PLANTS (named), distinct and useful for decoration and cutting purposes, 2s.

12 DISTINCT PLANTS for Windows, 2s.

GERMAN SCABIOUS.—Eight distinct colours of this most beautiful, hardy, free-flowering, easily-grown attractive plant; really grand for border decoration and cut flowers; 12 for 1s. 6d.; 25 for 2s. 6d.

HOLLYHOCKS.—Warranted all fine double flowers, Chater's select strain; strong year-old plants to bloom this summer; 12 varieties, 3s.; 6 varieties, 2s.

SPECIAL OFFER of 100 strong healthy plants of fancy and show PANSIES and VIOLAS for an early and extra show for the borders, unnamed, 10s.; or 50 for 5s. 6d.

STRAWBERRY PLANTS.—A grand collection, including many grand new varieties from the best English, French, and American raisers, 3s. per 100.

HEATING OF  ALL KINDS.

Testimonials.

"Shirburn Castle, January 5, 1890.
"SIR,—As you requested my opinion of the houses which you erected for me some 4 years ago, I beg to inform you that I consider them a perfect success, and I have recommended them to many of my neighbours.—Yours truly (signed) MACCLESFIELD."
"Hornby Castle, Lancaster, February, 1890.
"Major FOSTER has much pleasure in stating that the vineries and forcing-houses which were erected by Mr. Helliwell in 1884, continue to give perfect satisfaction, both to himself and his gardener."
"Estate Office, Ripley, Yorkshire, January 23, 1890.
"Sir HENRY INGILBY has much pleasure in stating that the glazing work executed by you, under your patented system, at the Ripley Castle Gardens, has been in every respect entirely satisfactory. The work has stood its 8 years' wear and tear extremely well, and has hitherto cost nothing to keep it in repair."

Ivy-leaf Geraniums, in variety, from single pots, fine stuff, 15*s.* per 100.
PELARGONIUMS, Show, Fancy, and Decorative, best sorts to name, from large 60's, 25*s.* per 100.
AGERATUM, The Zoo, Dwarfest Dark Blue, very fine, 6*s.* per 100 ; 50*s.* per 1000.
,, Imperial Dwarf, fine, 6*s.* per 100 ; 50*s.* per 1000.
CALCEOLARIAS, Golden Gem, the best, 6*s.* per 100.
,, Camden Hero, finest crimson, 8*s.* per 100.
FUCHSIAS, best market and exhibition sorts, to name, 7*s.* per 100, or 60*s.* per 1000.
HELIOTROPES, Jaun. D. Amour, President Garfield, Gloire de Massiffs, finest darks, 6*s.* per 100, or 50*s.* per 1000.
,, White Lady, light for bedding, fine—finest lights, 6*s.* per 100, or 50*s.* per 1000.
IRESINE, Lindenii and Herbertii, fine crimson leaf, 6*s.* per 100, or 50*s.* per 1000.
ALTERNANTHERAS, Magnifica (fine), Paronychoides major aurea, and amœna, 6*s.* per 100, or 50*s.* per 1000.
COLEUS, pot varieties, in a good assortment, 8*s* per 100.
MESEMBRYANTHEMUMS, cordifolium variegatums, 6*s.* per 100.
MUSK, fine transplanted stuff, 4*s.* per 100.
SOLANUMS, finest market variety from cuttings, very strong, 8*s.* per 100.
LOBELIAS, Pumila magnifica, Blue King (the finest) Emperor William, the three best blues, true, from cuttings, 3*s.* per 100, 25*s.* per 1000.
LOBELIA, Snowball, finest white, 3*s.* 6*d.* per 100, 30*s.* p. 1000.

THE
Gardeners' Chronicle.
SATURDAY, APRIL 8, 1893.

GHENT QUINQUENNIAL.

THE programme of the quinquennial exhibition contains no fewer than 72 classes for Orchids, and 17 classes devoted to "new plants." A specially interesting competition may be expected in Class 1, "six plants, in or out of flower, recently introduced and not in commerce." In view of these facts, we have been at the pains to collect information as to the plants likely to be exhibited, and as to the firms who are likely to take part in these interesting competitions. Much of our information cannot be made public till the time of the show (April 16 to 23), but there is no indiscretion in publishing the notes that follow at the present time. Some of the plants now recorded are not absolutely new, but many will assuredly be shown in one or other of the classes at Ghent, though not necessarily by the firms here mentioned. Except where otherwise stated, the notes on the plants have been taken by ourselves; in other cases, the exhibitors are responsible for the description.

HORT. BULL.

HELICONIA ILLUSTRIS, *Hort. Bull.*, n. 4711.

A remarkably beautifully-coloured foliage plant from the South Sea Islands. It is a Musa-like plant, with the leaves tufted at the base, arranged in two ranks above. Stalks, 10 to 12 inches long, sheathing, ascending, cylindric, bright rose-red leaf-blades 12 by 4 inches, spreading, membranous ovate-lanceolate, acuminate entire, tapering at the base, midrib prominent, grooved on the upper, convex on the lower surface, rose-pink ; secondary veins closely set, some running to the margin, where they form loops, others intermediate, shorter, all rose-pink. Although we have not seen the flowers, there is little doubt as to the genus, and none at all as to its merits as a superb adornment to the stove. *M. T. M.*

CYRTANTHUS (HYBRIDA) INTERMEDIA, *Hort. Bull.*

An elegant plant raised in Mr. Bull's establishment, between C. McKennii and C. angustifolius. The height is about 18 to 20 inches, with strap-shaped leaves, and an erect two-edged hollow scape, bearing at the summit membranous deflexed spathes, surrounding a one-sided many-flowered truss. Flowers orange-pink, about 1¾ inch long, curved tubular-trumpet shaped, continuous at the base, with the short three-sided ovary ; segments of the limb oblong, somewhat spreading, outer three rose-coloured, with a green midrib, inner three rather broader, uniformly rose-coloured. Stamens all included, and not extending beyond the middle of the tube (in C. McKennii they spring from the upper part of the tube), three longer than the other three ; anthers proterandrous ; style filiform, as long as the flower tube. *M. T. M.*

VRIESIA PURPURASCENS, *Hort. Bull.*, 4255.

A richly-coloured Bromeliaceous plant from Brazil, with deep purple sheathing leaves, each oblong-lanceolate from a dilated base, apex mucronate,

*

margins with numerous closely-set fine teeth, upper surface dark green, flushed with blackish-purple, under surface wholly purple.

Hoplophytum lineatum, *Hort. Bull.*, 4223.

A striking Bromeliaceous plant from Brazil, with cylindric tufts of leaves, spreading at the apex. Leaves oblong, strap-shaped, concave, abruptly acuminate, finely and remotely toothed, green, with alternating broad stripes of white, marginal spines black.

Lamprococcus speciosus, *Hort. Bull.*, 4222.

A highly ornamental Brazilian Bromeliad, of moderate size. Leaves tufted, spreading, leathery, oblong-acute, mucronate, finely-toothed at the margin, concave above, more or less densely covered with silvery scales, especially on the under surface; above, bright shining green, banded with broad longitudinal stripes of clear yellow.

Geonoma acaulis, *Martius.*

A dwarf, nearly stemless Brazilian Palm, with short, dilated, sheathing leaf-stalks, destitute of spines, the young leaves roundish, deeply two-lobed at the apex, plicated, erose, adult leaves deeply pinnately divided, pinnæ lanceolate. A native of Northern Brazil. The plant is fully described and figured in Martius' *Palms*, 18, t. 4, et t. 19. *Hort. Bull.*, 3594.

Oncosperma fasciculatum, *Thwaites.*

A Cingalese Palm, having in the adult condition a trunk 30 to 40 feet high, with pinnated leaves as much as 18 feet in length. The rachis is covered with brown fluffy scales, and is provided with long slender black spines; the leaflets in the young plant measure from 12 to 18 inches in length by 1 to 1¾ inch in width, and are lanceolate-acuminate in form, the midrib scaly on the under surface. The plant was described by Thwaites in his *Enumeratio*, 328; and is included in Hooker's *Flora of British India*, vi., p. 415. *Hort. Bull.*

Philodendron [?] notabile, *Hort. Bull.*

A noble stove Aroid of large dimensions, with a short stock marked with the closely-set large scars of fallen leaves; petioles 3 to 4 feet long, cylindrical, wide-spreading. Blade 2 feet or more long, leathery, deep green, deeply cordate at the base, with spreading lobes, above oblong, remotely and boldly pinnately-lobed; lobes oblong, midrib prominent. The habit of the plant reminds one of some Fern-like Marattia.

Aglaonema versicolor, *Hort. Bull.*, 4133.

An ornamental stove foliage plant belonging to the Aroid family, and introduced from the East Indies. The stem is erect, and bears beautifully-mottled shortly-stalked spreading leaves. Petioles 1¼ inch, sheathing with membranous edges. Blade 4 by 2 inches, probably much larger when fully developed, membranous, obliquely oblong, rounded at the base, acute at the apex, irregularly blotched with patches of dark velvety green interspersed among patches of lighter green, and some of milky-white. Midrib slightly raised, but a central groove on the upper-surface, very prominent on the lower surface. In the absence of flowers, the genus to which the plant is assigned, is a matter of conjecture.

Hypolytrum Schraderianum, *Hort. Bull.*, 3067.

An ornamental and very striking Cyperaceous plant from Brazil, determined by Mr. C. B. Clarke, F. R. S. The spreading leaves are crowded in bold triangular tufts; each leaf is about 2 feet 6 inches in length, by 2¼ inches in breadth, purplish, sheathing, and folded at the base, expanding above into an arching, strap-shaped, acuminate, entire blade of firm texture, green, with purplish-red margins, and traversed on the upper surface by two ribs running equi-distantly from base to apex between the centre and the margins of the leaf, midrib prominent beneath. The bold, triangular tuft of leaves, the colour, and the peculiar venation of the leaves, give this plant a very distinct appearance. *M. T. M.*

Selaginella usta.*

An elegant species from New Caledonia, with erect pale green fronds, measuring about 10 by 6 inches, oblong acute in outline, arching from base to apex, and convex from side to side on the upper surface, rachis wiry, the thickness of a crow-quill, bi-tri-pinnately divided, ultimate divisions linear-oblong. Lateral leaves 2 to 3 mm. long, distichous, spreading, crowded, cordate, ovate, acuminate, slightly oblique. Upper leaves distichous, flattened against the rachis, alternate, slightly imbricate, one half smaller than the side leaves, and of similar form, but less oblique. Spikes terminal, 5 to 6 mm. long, four-sided, with ovate-acuminate bracts. *M. T. M.*

Pteris tremula variegata, *Hort. Bull.*

A form of this well-known Fern, in which the ultimate segments are linear-oblong, light green, with a central band of milky-white.

Davallia elegans var. epiphylla, *Hort. Bull.*, 4731.

A specially elegant Fern in the way of D. fijiensis, but quite distinct from it. The root-stock is creeping and covered with brown scales. Stipes, 10 to 12 inches long, as thick as a crow-quill, glabrous, wiry, purple, deeply channelled. Fronds arching, 12 to 14 inches by 18, subcoriaceous, dull green, deltoid, 3 — to 4 — pinnately divided, larger pinnæ deltoid lanceolate, pinnules narrow wedge-shaped deeply pinnately divided, ultimate segments about ¼ inch by ⅛ inch, three or more lobed, lobes ascending, oblong-bluntish. Introduced from N. S. Wales.

Davallia solida var. ornata.

A bold-looking handsome Fern, with deep shining green coriaceous fronds. The root-stock is of the thickness of the finger, and covered with soft fibrillose scales. Stipes 8 to 9 inches long, wiry, purplish, channelled above. Fronds 9 to 10 by 18 to 20 inches, deltoid bipinnate, primary pinnæ wedge-shaped at the base, lanceolate-acuminate; secondary pinnæ broadly oblong, wedge-shaped, deeply lobed at the base, gradually less so towards the apex; ultimate segments 1 inch long by ¼ inch wide, oblong, obtuse, remotely and shallowly toothed at the margin.

D. lucida. *Hort. Bull.*, no number.

Davallia decora, *Hort. Bull.*, 2023.

An elegant North Australian Fern. The wiry purplish leaf-stalks are of the thickness of whip-cord, and rise from a stout creeping stock. The fronds are 7 to 8 inches long, subcoriaceous, dull green and glabrous on both surfaces, deltoid acuminate, tripinnate; pinnæ oblong, wedge-shaped at the base, deeply divided (pinnatiseet) to near the middle, less deeply so (pinnatifid) towards the apex; ultimate segments ½ inch by ⅛ inch, oblong-obovate, wedge-shaped at the base, remotely crenate at the apex.

HORT. DAMMANN.

Messrs. Dammann & Co. announce the following novelties, many from Abyssinia, and which are, therefore, likely to be interesting. We have not seen the plants, and take the following details from Messrs. Dammann's list:—

Kalanchoe grandiflora.—An Abyssinian succulent plant, with rose-coloured leaves, flushed with silver. Suitable for bedding, like an Echeveria.

K. glandulosa.

K. Cassiopega.

K. glaucescens.

Cotyledon Barbeyi.— A beautiful species, introduced by Professor Schweinfurth from Abyssinia. Habit dwarf, colour glaucous; flowers bell-shaped, drooping, olive-green. Suitable for bedding.

* *Selaginella usta*, Baker (ex Viellard), in Britten, *Journal of Botany* (1885), p. 23, and in *Handbook of the Fern Allies*, p. 94.

"Stems 9 to 12 inches long, erect, simple at the base, compound in the upper three quarters, the branches erecto-patent, the lower simple or little compound, the upper short, rhomboid, copiously compound. Leaves of the lower plane crowded, erecto-patent, ovate or oblong, subacute, half line long, bright green, rigid, dilated, cordate, serrulate, and imbricated over the stem on the upper side at the base; leaves of the upper plane a third as long, oblique oblong, acute, much imbricated. Spikes square, ¼ to ½ inch long, ½ lin. diam.; bracts ovate cuspidate, acutely keeled. Hab., New Caledonia, on mountains near Wagap. Vieillard! Pancher!" *Baker, loc. cit.*

Coleus Gerindanus.

C. Penzigii floribundus.

C. Penzigii smaragdinus.

C. spicatus "*Rondinella.*"

Cissus tetragona.—An evergreen greenhouse climber from Valdivia. Leaves divided into five segments. Suitable for wreaths, &c.

Huernia Sprengeri.—An Abyssinian succulent plant, branches quadrangular, deeply and sharply lobed, 6 to 8 inches high, covered with tufts of large bronzy-yellow flowers.

Pentas lanceolata Quartiniana. — Said to be superior to Pentas carnea in its freer flowering properties.

Pelargonium multibracteatum. — An Abyssinian plant in the way of P. peltatum, foliage bronzy, flowers snow white.

Stapelia albicans.—A remarkable species, with white stems; flowers yellowish, spotted with purple.

S. verrucosa.—Dwarf, with short branches, at the extremity of which are produced in summer one or more flowers of a bronzy-green colour, and curiously spotted.

Sarcostemma stipitacea monstrosa.—A remarkable Asclepiad, with twining stems devoid of leaves, but producing numerous dull coloured flowers. S. viminalis is similar.

Cotyledon quitensis, described as a magnificent species, producing in winter panicles of large scarlet flowers.

Senecio subscandens.—A pretty evergreen shrub for the greenhouse. It has somewhat of a climbing habit, with deeply divided leaves, and clusters of yellow flowers produced in the winter season.

Plectranthus Schweinfurthi, *P. hadiensis*, and *P. herbacens.*

Messrs. Dammann & Co. also mention several new species of Plectranthus.

HORT. LEMOINE.

Barbacenia squamata, Paxton. — This very free-flowering species, discovered by William Lobb in the mountains of South Brazil, slightly resembles in its foliage as does also Barbacenia purpurea, a Carex; in fact, the stems, which are over 3 feet high, bear at their tip rosettes of broad leaves, reflexed, bright green, whence rise the peduncles each terminated by a large purplish-red flower composed of six triangular segments well spread out and reflexed; this flower measures from 1¼ to 1½ inch across; the lobes are purplish-vermilion, and in the centre, is a ring of white anthers. *Hort. Lemoine.*

Begonia coronata ×.—A hybrid from B. caroliniæfolia by B. polyantha, stems fleshy; erect, about 18 inches high; leaves long, dentated, clear green; large panicles of pinkish-white flowers springing from each axil; flowering season, December to April, *Hort. Lemoine.*

Hillia tetrandra, Swartz.—A shrub, originally from the Antilles, with a perfectly erect habit, stems thick, straight; leaves firm, oval, opposite, and in two rows, as are also the branches, dark green veined stipules, broad, white; the upper ramifications are surmounted each by a large tubular flower, in form like that of Bouvardia Humboldti, but much larger; the tube which is 2½ to 2¾ inches long, is crowned by four fleshy lobes, reflexed, and forming a corolla nearly 2 inches across; of a beautiful waxy-white, scented at certain times of the day. This is a fine plant of the Rubiaceæ family, belonging to the same group as Cinchona Bouvardia, Luculia, &c. *Hort. Lemoine.*

Philadelphus Lemoinei var. Boule d'argent.—Flowers large, very double, white, with the scent of that of P. microphyllus. This plant was raised from P. Lemoinei ×, crossed with a double variety of P. coronarius.

Philadelphus Gerbe de Neige.—Very large flowers, which grow to the size of those of P. speciosissimus, very pure white, with the scent of P. microphyllus; the branches are arched and bent down by the weight and abundance of the flowers. *Hort. Lemoine.*

Tamarix kashgarica.—A new species discovered by Roborowsky in Central Asia; it differs in appearance from the rest of the genus. The leaves are very small, glaucous-green, are appressed and imbri-

cated on the stems like those of Veronica lycopodioides. This plant has not yet bloomed in cultivation. *Hort. Lemoine.*

HORT. PYNAERT.

Adiantum nebulosum, Hort. Pynaert.—A very pretty form, raised in Mr. Pynaert's establishment. The fronds are still finer and more delicate than those of gracillimum. Certificate of Merit of the Chambre Syndicale des Horticulteurs Belges.

Anthurium Andreanum var. amœnum, Hort. Pynaert.—Among the seedlings whence the fine A. atrosanguineum was raised, this plant was found, with flowers perfect in form and of a fine fresh rosy-carmine colour. Spadix white, golden-yellow at the tip. An excellent variety. *Hort Pynaert.*

Anthurium Andreanum var. Louisæ, Hort. Pynaert.—The colouring is very delicate, pale salmon-pink, and very effective.

Anthurium Andreanum var. atrosanguineum, Hort. Pynaert.—Flowers very large, reddish-purple, very dark and showy. Like the two preceding varieties, this handsome novelty flowers all the year, and forms a most striking and lasting decorative plant. It obtained a Certificate of Merit from the Chambre Syndicale des Horticulteurs Belges.

Anthurium hyb. Gandavense, Hort. Pynaert.—From A. Chantrieri by Andreanum. A splendid plant; very vigorous. Foliage very abundant and decorative. Spathe large, rounded, pure white; spadix erect, very long, rosy-violet. A free-flowering and exceedingly effective variety.

Anthurium hyb. Mrs. John Laing, Hort. Pynaert.—The same origin as the preceding variety. A plant of slender habit, very elegant and floriferous. Floral spathe rounded, white, slightly flushed with rose. Spadix erect, reddish-violet. A variety remarkable in habit and blooming. *Hort. Pynaert.*

Azalea mollis × *sinensis, Hort. Pynaert.*—This new strain differs from A. mollis by the warmer, deeper colouring of the flowers. These also seem less susceptible to injury by rain. The shrubs may be known by their harder and more robust wood. They seem proof against any weather, and their buds endured perfectly a frost of 20° C. The varieties of this species are of all shades of colour, from pure white to the brightest carmine, shading through every tone of the most delicate sulphur and salmon-yellow.

Azalea indica Germaine Pynaert.—Raised from a sport from A. Charles Pynaert. Flower large, with wide petals, reflexed outwards; in colour rose, slightly salmony, and edged by a snow-white wavy band. This variety has all the characteristics distinguishing the remarkable and popular variety from which it was raised—the vigour and good growth of the plant, the late flowers, and the large blooms which last so long. *Hort. Pynaert.*

Camellia aliatar cocina, Hort. Pynaert.—A very fine variety, quite distinct from all existing ones. Flower very large, nicely imbricated; petals well rounded, of a fine flesh-pink, marked with a very distinct white stripe in the centre. A very vigorous plant, with broad deep-green leaves. Its buds are developed in a very remarkable way.

Cliveia grandiflora Petite Germaine, Hort. Pynaert. This new variety, raised from C. Linden, has all the characteristics of the latter, but is much superior to it. Its large flowers, of excellent form, are of a brilliant colour, contrasting sharply with the pure white throat.

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

SCHIZOCODON SOLDANELLOIDES.*

This is a very beautiful and a very interesting plant. Its botanical history is well-established in the publications cited in the foot-note, so that we need do no more here than briefly indicate its salient characteristics. It is a low-growing tufted herbaceous perennial, with long stalked somewhat leathery evergreen, cordate, ovate, acute, engrailed leaves of a bronzy-green colour, red at the edges, and pinkish cream-coloured, nodding bell-shaped fringed flowers. The scape is erect, and provided with a few scattered, oblong bracts, and a raceme of six to eight flowers. The calyx has five oblong obtuse sepals, surrounding a bell-shaped corolla of five obovate flesh-coloured petals, deeply fringed at the free end. It is a charming plant for the rockery, but might require some little protection in the winter. Our figure, drawn by Mr. Worthington Smith, was taken from a plant exhibited at the Royal Horticultural Society by Captain Torrens, Baston Manor, Hayes, and which had been brought by that gentleman from the

Fig. 59.—SCHIZOCODON SOLDANELLOIDES.

mountains of Japan. The flowers much resemble those of a Soldanella, but the nearest affinity is with Shortia galacifolia, already figured in our columns, and whose history is so interesting to the botanist and geographer. Both are included in the little order of Diapensiads, which includes also the pretty little Diapensia lapponica of arctic Europe. *M. T. M.*

* *Schizocodon soldanelloides.* Siebold and Zuccarini, *Plantarum quas in Japonia collegit;* Dr. Ph. F. v. Siebold, *Genera Nova, &c.* (1837—43), in *Abhandl. d. Math. Physik. Class. der Kœn. Bayersch. Acad. d. Wissensch. Band,* iii., p. 725; Maximowicz, *Melanges Biol.* part 5, p. 273; pars. 8, p. 19; Franchet et Savatier, *Enum. Plant. Jap.*, i., 298.

TREES AND SHRUBS.

HARDY JAPANESE MAPLES.

Some thirty years have now elapsed since Messrs. Veitch & Sons, Chelsea, commenced importing these beautiful hardy Maples. These rank amongst the finest hardy trees; yet how seldom do we see them used, as they might be, for producing pictorial effects in our subtropical gardens! They may be seen used pretty freely, and with good effect, in some of our public parks—but not so in private gardens. For form of leaf and pretty colours few plants can equal, and none surpass, the lovely varieties of Acer polymorphum and palmatifidum. The plants are of lowly growth, invaluable for shrubberies and rockeries, and well adapted for gardens of small size. The leaves in the spring unfold of a beautiful claret-purple, and retain their colour all through the summer, dying off of a vivid crimson or bright yellow. In form the leaves are similar to those of the Liquidambar; but unlike that tree, their colouring-matter of the leaves is not affected by our cold sunless summers. Many are grown on short standards. It is as hardy as the common Aucuba, having withstood 32° of frost without protection. I can vouch for its hardiness. Although hardy, they do not like exposure to the wind, and should at all times be planted in a sheltered nook, but open to the south if possible. They are also suitable for table and conservatory decoration in spring. With the exception of the Retinosporas, many of the Japanese plants have been overlooked or undervalued for pictorial planting, and they certainly deserve to be brought into more general use. *A. Evans.*

MARKET GARDENING UNDER GLASS.

(Continued from p. 354.)

Mr. P. Ladds, Swanley.—An acre of ground covered with glass would have been thought quite exceptional but a few years ago, yet such is the progress which has been made that here we find about 12 acres so covered, and this for market purposes. This immense establishment of Mr. Ladd's adjoins the Swanley station on the London, Chatham, and Dover Railway, and anyone interested in the production of fruits and plants, and wishing to see this carried on in houses of such dimensions as may be rarely seen elsewhere, will, we feel sure have no difficulty in obtaining the necessary permission. Swanley enjoys all the advantages of a Kentish climate, and one is not surprised to find that there are several large market growers in the district; indeed, that part of Swanley known as Swanley Junction seems to owe its population, as it certainly does its importance, to this particular business, and to the large nursery of Messrs. H. Cannell & Sons. But a few years ago, when Mr. Cannell's establishment and Mr. Ladd's also were not commenced, there were hardly any houses in the district, but mainly as the result of that growth the population, we expect, now amounts to a hundred or two. We merely state these facts, in order to emphasise the importance which now attaches to the industry, in regard to many such country districts, which is one of the strongest reasons why it should be encouraged by the railway companies, to the same extent that they appear to have encouraged the foreigner.

Turning to the nursery, most of the houses are of the usual stamp in these places, that is, they are three-quarter span, about 6 to 7 feet high, and 13 to 15 feet wide. In length they are 200 feet, and the houses being all joined together and the span between each only descending three-quarter length, they are all connected, making a large, low, house on the ridge and furrow principle. Of course, these are arranged in blocks, and those in any one block are kept about the same temperature as each other. Six of these divisions were filled with double show and zonal Pelargonium plants, and are grown chiefly for sale in pots.

Heaths are done largely and well, and there are many thousands to be sent to market this season in three or four varieties, such as E. Wilmoreana and E. hyemalis. About 100,000 cuttings are raised each year, and at the time of our visit, these were being transferred from the cutting-pot into fresh soil. The loss per cent., although greater than in many other genera, is extremely low comparatively. Passing from these one comes upon a batch of about 30,000 to 40 000 Callas. Market growers never plant their Callas out. They bloom quite as well without, and the stem to the flowers are not so fleshy, which is a desideratum. Rampant foliage is

not required. One house contains nothing but Smilax asparagoides, which is planted out and trained vertically to strings running to the roof. Thousands of long sprays of this graceful climber are sent to market, and there find a ready sale.

Roses are grown in quantity; some 20,000 Niphetos ensure blooms of this popular variety every day in the year. A very great number of Gladiolus The Bride are grown in pots for furnishing cut bloom. Fuchsias are only of use to sell as plants, and they are produced in batches, the first lot of which will be ready for market very shortly; they are in 5-inch or 6-inch pots, and will soon show bloom. All of them are well-grown, and some half-dozen or so of varieties represent the different colours. There are quite 30,000 of these plants for this season. The white Marguerite is even more numerous, for there are 40,000 plants, and from what we have seen at other places, it appears to be one of the most popular of all market plants.

Five houses are devoted to Stephanotis floribunda, which is allowed to grow naturally during the summer, but has to submit to the severest pruning in winter.

Strawberries are not quite so numerous here this year, but there are about 20,000 plants in pots, and they are all Sir Joseph Paxton. The Grapes are a feature, and are cultivated in houses of another stamp, although alike in that they are all span-roofed. Taking the Black Alicante first, there are three houses of 500 feet, three of 300, and ten of 200 feet. What a weight of Grapes such an area must produce! especially when we remember that they are all done well. Black Hamburghs have five houses, each 200 feet, devoted to them. The largest house of all is reserved for Gros Colmar, and measures 700 feet long, by about 25 feet wide, perhaps the largest house devoted to one variety of Grapes in the country. Tomatos are turned out in quantity, but the greater bulk of these is produced at the other establishments of Mr. Ladds at Meopham and at Dartford Heath, both of which places are devoted to fruit.

(To be continued.)

NEW ZEALAND.

Rare Plants from Seed.—The following somewhat rare plants I have succeeded in obtaining from seed received from E. Benary, of Erfurt:—Delphinium Zalil, Ostrowskia grandiflora, and Æthionema grandiflora. I see Mr. Ware, of Tottenham, has succeeded in flowering the latter; and the second I have seen a coloured plate of. Has any one succeeded in flowering the latter in Europe, and is it a strong grower? as I have it only in its second year.

Pittosporum or Pinatipo.

If this plant would stand the rigorous climate of Europe, then, indeed, would landscape gardeners have an ideal bush to beautify their work. But the formidable little word "if" stands in the way, and the gardens of Northern Europe are deprived of one of the handsomest objects in the vegetable kingdom for that purpose. Its superb pyramidal form, with its glaucous sheen and fimbriated or frilled margined leaves, is something to admire and remember. Given plenty of room in a temperate clime, it is simply unique. Smoke and dust it abhors. The latter name is that given it by the native Maories. *T. Smith, Seedsman, &c., Timaru, N.Z.* [What is the species? Ed.]

CULTURAL MEMORANDA.

PHYLLANTHUS NIVOSUS VARIEGATUS.

In this plant we have a useful decorative subject, of erect habit, and leaves of a green colour, spotted and streaked with white, the young shoots being almost white. At this season it strikes readily from cuttings, or eyes taken with a bit of mature wood, inserted in sandy compost, and the pots plunged in a moderate bottom-heat, under the usual treatment of cuttings of stove plants. When rooting has fully taken place, the cuttings must be removed from the pots, and potted singly in 60's, watering them, and returning them to the hot-bed when the foliage has dried. The plant is very useful, when grown in 3 and 4-inch pots, for various purposes in the decoration of the dinner-table, jardinières, &c. I have frequently struck the leaves of the plant, when taken off with a bit of old wood, by placing them in saucers filled with water. *H. W. W.*

The Carnation: Seasonable Notes.

I wrote some cultural notes on the tree or perpetual flowering Carnation at p. 176. At that time (February) we were busy taking cuttings and getting up a stock of plants for next season's flowering. We have a good stock of plants which have now passed out of the warm propagating-house into cold frames. The Carnation does not do well when cultivated under glass in the summer, and it is not to be expected that it should do so, being naturally quite hardy, and thriving in exposed positions; but the plants are easily checked in their growth by sudden changes, and they ought not to be exposed to such. They should be taken first from the propagating-house into one that can be heated, and gradually inured, to a free admission of air. From this house place them into ordinary garden frames, where the lights can be removed altogether from the plants in fine weather, and with care not the least injury will happen to the plants; but on the other hand, they may suffer from inattention as to repotting. This is an important matter, and must not be delayed very long after the young plants are ready. The entire process of repotting tree Carnations is as follows: As soon as the slips show evident signs of growth, they must be carefully removed and repotted into very small flower-pots, still keeping them near the roof-glass in the same house; when established, remove them to the greenhouse, and repot them into large 60's. The plants may be shifted from these into 32's, and in this size they will flower. A little light fibrous peat may with advantage be added to the yellow loam—say two-thirds loam, one-third peat, and decayed stable manure one-third. *J. Douglas.*

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

APRICOTS.—If we except the frosts experienced on the mornings of the 19th, 20th, and 21st ult., which throughout the country varied from 10° to 16°, it is seldom that a season has been so favourable for the blooming of the trees as the present one. Where the trees were protected, the weather being dry and the walls warmed with the sun at the time the frosts occurred, it will be found that in most cases only the bloom situated on the longest spurs has been killed, and sufficient escaped injury to make a crop. According to the state of the weather prevailing after this date, the wall coverings may be reduced in amount where poles and nets are employed, the latter being laid rather close towards the tops of the trees; as if this be not attended to, the young shoots very soon become entangled in it. My practice is to protect with two thicknesses of Strawberry net, and over this one thickness of ½-inch fish-net. The fish-net will now be removed. Some slight amount of disbudding will be necessary, and it should now be attended to. This will consist in reducing the number of shoots at the ends of leading branches of last year's growth at the tips of foreright spurs, where these have become too long, and those at the back of the branches, or where they are otherwise badly placed.

PEACHES AND NECTARINES.—The bloom of these fruits, not being sufficiently forward to have been injured in any way by the frosts of the past month, a splendid "set" in the South at least should be general. According as the weather is mild and genial, disbudding may be commenced; but if it be dull, with cold winds, and frosty at night, the operation should be postponed, and especially should it not be hurried with trees which are not vigorous. In any case let it be done gradually, and especially at this early date. Remove the foreright shoots, and those at the back of the shoots and branches, but those with fruits at the base, pinch the points for the present, removing them entirely subsequently. Keep aphis in check with tobacco-powder until the tree coverings are removed, and the weather is warm enough to admit of the trees being syringed with insecticide. With outdoor Peaches and Nectarines, the closest attention must be paid to encouraging the earliest growths, as upon attention to this depends the success more than upon any other item. Any curled or blistered leaves should be picked off, and where these appear at the ends of young shoots of last season, it is an indication that the wood was imperfectly ripened, and it may be cut back to a healthy break.

GENERAL REMARKS.—Should an unfavourable change in the weather take place, the bloom-buds on Apple trees being very forward, where trees are grown on the Paradise or dwarfing stock, and are of only moderate size, the bloom may be protected by placing six stakes round each tree to support a covering of old fish-netting; and when frost threatens, a mat could also be thrown over the top. In this way I am obliged to protect the fruit on such trees from blackbirds and thrushes in the autumn, and suitable lengths of netting are kept in store for this purpose. Where clay is used for grafting, mix some with water to the consistency of paint, and with a painter's brush go over the grafts frequently, painting them over and stopping cracks, success depending upon keeping the united parts air-tight until the scions begin to grow. It is in this respect that grafting wax is better than clay, as no after-care is necessary.

THE KITCHEN GARDEN.

By H. C. Prinsep, *Gardener, Buxted Park, Uckfield.*

ASPARAGUS.—New beds may now be planted, in showery weather. If roots have to be bought, this should be done at once, as they are apt to become dry in transit, and when that is the case, the buds do not start readily into growth. It is best to form the soil into small ridges for planting, spreading the roots out evenly on each side of the ridge, in such a manner as to allow the crown to rest on the top. Cover with soil from between the beds to a depth of 2 inches. If covered much deeper than this, and cold weather should set in, the soil is not sufficiently warm to cause growth to start at once, so that the roots often perish in consequence. Asparagus is not difficult to grow on good well-drained land, but in cold, heavy soil, the roots rot off in numbers in the winter. Seed may now be sown. Should the plants be required to remain where the seed is sown, then the beds must be prepared as previously advised; but if the purpose is to produce a stock of roots to force inside, it will not be necessary to go to that trouble. The soil must be rich, if strong plants fit for transplanting are to be obtained in one season, and to further this end, early thinning of the seedlings should be practised, so as to favour development. It is not often that this vegetable can be cut from the open ground at the end of March, but in sheltered situations in this district this has been done this year.

BEET.—A small sowing of this should now be made to afford an early supply of roots. The soil should be reduced to a fine tilth before it is sown. It is also essential that the plants be encouraged to grow as quickly as possible, or they are liable to bolt. Thinning should be done early, and weak doses of liquid-manure should be afforded when growth has become active.

CAPSICUMS AND CHILIS.—A good deal of attention will now be needed by these plants, and they must not be allowed to suffer from lack of re-potting when the state of the roots renders this necessary, or from want of direct sunlight, keeping them at a short distance from the glass. If a hot-bed is available on which they could be planted out, growth would be more robust; the flowers would also set more freely, and abundance of ripe fruit would be obtainable from the month of June onwards.

TURNIPS.—These are sometimes difficult to obtain from the open ground very early in the season, owing to cold winds and changeable weather checking growth, and favouring the increase of the Turnip-fly. When the plants are advanced sufficiently to be thinned or singled-out, a few Spruce boughs may be stuck about the bed to ward off the wind from them; it is astonishing how a slight barrier like this will break the wind's force. Watering must also be attended to; although it will not be necessary to water them freely till the plants have attained some size, if it be sufficient to keep the surface moist, that will do for

the present. If the fly make its appearance, dust the leaves with fresh-slaked lime in the early morning, and afford no water for a day or two.

SALADS will now be in demand, and supplies must be kept up by frequent sowings. Radishes on light soil soon get tough and hot to the taste, and no large sowings are necessary, but a small quantity only should be sown once a week. Avoid sowing the seed thickly, as when this is done the plants often fail to make usable roots; thin early to about 1 inch apart. Small salading should be sown frequently, for with warmer weather growth will be more rapid. Lettuce of the Golden Queen type should now be plentiful.

STORE-ROOM AND CELLAR. — Remove the growths from Potatos, Parsnips, Carrots, and Beet as fast as they show, and keep the places cool, admitting no more light and air than are absolutely necessary.

BROCCOLI.—Seed of the early varieties may now be sown in the north, but here we prefer not to sow before the first week in May, except for autumn use. All such plants should be grown from the first as robustly as possible; and it is better, therefore, to defer sowing for a few days, than to have the plants spoiled before they can be transplanted.

THE FLOWER GARDEN.

By T. H. Crasp, *Gardener, Canford Manor, Wimborne.*

HARDY AQUATIC PLANTS.—These should now receive attention in the way of cleansing, dividing, replanting, &c. If Nymphæas and such things are grown in tanks surrounding fountains, the water should be let off, and the tank thoroughly cleansed; should the plants be grown in pots or tubs, the same cleansing will be necessary. All dead leaves and rubbish should be removed, and any that require repotting should be potted into soil of rather a heavy nature, with plenty of cow-manure added; those which do not require moving, should have a good top-dressing with similar soil. The present time is suitable for procuring any addition to the collection that may be desired, as most hardy aquatics are just on the move. The following is a list of the most showy kinds, which grow and look well if planted in good-sized pots or tubs, and plunged in the sides of streams, lakes, or in tanks of water, surrounding fountains and such things:—Nuphar luteum, N. pumilum, Nymphæa alba, N. odorata, Sagittaria simplex, S. sagittifolia, Villarsia reniformis, V. nymphæoides, Menyanthes trifoliata, Irish pseudo-acorus fol. var., Hottonia palustris, Caltha palustris fl. pl., Butomus umbellatus, Aponogeton distachyon, Alisma Plantago, and Pontederia cordata.

GENERAL WORK.—Hollyhocks that were recently planted should receive a thorough mulching of well-decayed manure. Old stools which are now showing up through the soil should receive similar attention, and if the young shoots are over-crowded, thin them out, leaving three to six of the strongest for flowering. The first batches of Sweet Peas should be moulded as soon as they are 3 or 4 inches high, and a further sowing should be made. Lily of the Valley beds should receive a good top-dressing of well-decayed manure and leaf-soil, as the crowns are lifted for forcing, &c. The small crowns should be saved if the stock is to be increased, and new beds formed. The soil should be well trenched, and plenty of rotted manure and leaf-soil added. Divide the ground into 4-feet beds, with a path of about 1 foot between each bed, which will prevent injury to the crowns through trampling on the beds when weeding them, &c. The crowns should be planted about 3 inches apart in the rows, and about 1 foot from row to row. Violets that were planted in frames have nearly finished blooming, and should now be taken up and divided, saving the strongest young growths that have roots for increase and next season's blooming, as Violets always bear the best blooms on young plants. They should be planted in lines or beds about 1 foot apart each way, the soil being previously enriched with well-decayed manure or leaf-soil. After they are planted, they should have a thorough watering, and if a half-shady site is not attainable, they should be shaded during the hottest part of the day, and receive a good syringing overhead in the evening, thus preventing red-spider. If any flower-beds are to be sown with hardy annuals for an early summer display, no time should be lost in doing this, but if for a display later on in the summer, two or three weeks hence will be quite early enough. So great is the variety, beauty, &c., in hardy annuals, that very effective beds may be obtained at a small expense, which will equal anything made with ordinary bedding plants.

FRUITS UNDER GLASS.

By M. Temple, *Gardener, Carron House, Stirlingshire.*

PINES.—If the warm sunshine during the latter half of March has brought forward fruiting Pines too quickly, it may be well to retard a number by removing the plants to a somewhat cool and dry atmosphere. If the fruit has well-finished colouring, neither flavour nor weight is materially injured by such removal. Temperatures need not be increased for some weeks, as nights during April are often excessively cold, and the weather generally is very changeable; 75° artificial heat should fall to 70° when weather is cloudy and cold. The sun should always be harvested by closing the structure early in the afternoon. If suckers, which are not required, should appear on plants swelling their fruit, remove them without delay; also gills on fruit-stalks, which only rob the fruit. Water must be judiciously applied, keeping the soil moderately moist. Bottom-heat, if supplied by tan or other fermenting material, will fluctuate much during changeable weather, and should it rise above 90°, the pots should be raised above the plunging material till the intense heat subsides. Syringing should be done lightly, and only on bright afternoons, but sprinkle water on every surface. Young plants in any stage must now have a healthy growing atmosphere, and be supplied with air daily to keep growth sturdy. A close high temperature is ruinous, and causes weakly growth. It should never at this season exceed 70°, except by sun-heat.

VINES IN POTS.—Any ripening fruit should receive enough water only to prevent the roots suffering from drought. The atmosphere should be not too moist. A free bracing air is essential to fine flavour and high colour, but cold draughts must be avoided; later crops require plenty of moisture at the root and in the atmosphere, and weak liquid manure at every second watering. The water should reach every particle of soil in which the roots are growing; dryness at root is a fertile cause of red-spider.

STRAWBERRIES.—Those which are to supply latest crops should be all placed in frames, and brought on slowly with plenty of light and air. Fruits which are swelling should be free from stagnant moisture at the roots, but liberal waterings must be allowed. Those setting fruit should be assisted by means of a camel's-hair brush. Thin the fruits after they are set, to from eight to fifteen on each pot, and maintain a moist temperature from 65° to 70° with fire-heat, rising 10° or more with sunshine, and when colouring begins give air freely, and water moderately only, to prevent the plants from flagging. As soon as fruit is gathered, remove the plants to a position where they can have protection preparatory to planting them in the open ground. They should not be kept in vineries, as they are liable to become infested with red-spider.

THE ORCHID HOUSES.

By W. Holmes, *Gardener, Pickering Lodge, Timperley.*

DENDROBIUMS.—The species and varieties of D. chrysotoxum, D. clavatum, D. densiflorum, D. d. album, D. Dalhousieanum, D. fimbriatum, D. f. oculatum, D. Schroderii, D. suavissimum, D. thyrsiflorum, and some others having rested during the winter months, are now showing bloom buds and spikes, and if they are not already in growing quarters they should be removed to them at once, so as to afford a long season in which to make growth after the flowering is over. I try to keep this section of Dendrobium a little warmer during the time the plants are resting than is necessary with D. nobile and D. Wardianum. This is done by placing them at the warmest end of the house; in fact, they may be rested in the house in which they are grown if the air is kept dry and water withheld from them—still, it is better to have them in a house by themselves. D. Dalhousieanum requires a long period of time in which to make up its lengthy pseudobulbs, the time extending from the present till the month of November. This species makes a grand exhibition Orchid. As soon as the flowering is past, repotting or top-dressing should be undertaken, good fibrous Orchid peat and fresh-gathered sphagnum moss being mainly employed. In repotting, the pots may be three-parts filled with clean crocks, as when they are well-established, copious watering is required; but in affording water to newly-potted plants, great care must be used not to afford more than is just necessary till the new roots have pushed into the fresh compost. The species of insects that infest these Dendrobes the most are black-thrips, which harbour on the under-sides of the leaves, and as soon as such are observed, sponging with soft-soapy water, and slight fumigation should be adopted for a few nights. When in bloom the plants should be placed together and not syringed; the flowers soon decay if damped. When in full growth syringing once or twice a day is good practice. Sometimes red-spider infest the plants rapidly, and if not soon destroyed, they disfigure the leaves, making these look very unsightly. During growth a hot moist atmosphere should be kept up, but afford a small amount of bottom ventilation at night, stagnant dampness in the house causing "spot." Plants which may be intended for flowering during May can be retarded in a cool, airy house.

CYMBIDIUMS.—Plants of C. affine, C. eburneum, C. Lowianum, gone out of flower, may be repotted in good fibrous loam and peat, with clean crocks intermixed therewith. In potting these terrestrial Orchids, the top of the soil should be kept 1 or 2 inches below the pot-rims, so as to allow space for a considerable amount of water. The Cattleya or other house with an intermediate temperature suits these plants, and they should be well shaded when the sun is shining on the house. Plants of Odontoglossum Cervantesii, O. Rossii, whose flowering is finished, will be benefited by being potted or top-dressed, as may be required. For these species, shallow pans with plenty of drainage are best, and the coolest part of an Odontoglossum-house where there is an abundance of air will suit their requirements.

PLANTS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

STOVE FOLIAGE PLANTS.—Cuttings of Crotons, Dracænas, Acalyphas, and Dieffenbachias, that were struck or mossed some time since, will now be ready for potting. They will be better with a gentle bottom-heat for a time, and should be well shaded from bright sunshine. Specimen plants that require a shift should receive it at once; the bright weather of the past month has brought plants on very fast under glass. The foliage-house should be well syringed twice a day, the floors well damped, and the glass shaded with some kind of green shading, air being afforded at the top of the house, which should be closed early with plenty of moisture about. Temperature by night 65° to 70°; by day 75° to 85°. Acalypha tricolor is one of the useful plants for decorative purposes, as it will keep in good condition in a room longer than most stove foliage plants; it grows well in good peat loam and sand, with copious waterings of liquid manure. Plants of Curculigo recurvata and C. viridus should be divided, and potted into loam, leaf-mould, peat, and sand. They are useful plants, when grown in small pots, for filling both baskets and vases. Cissus discolor, a beautiful old climber, is invaluable in the warm foliage-house, and it looks best when allowed to twine itself on string or wire up the rafters, or against a wall. For a specimen plant, the best plan is to train it to three strong green painted stakes carelessly, letting it take its own way. Old plants that have been kept dry during the winter may now be repotted in a mixture of peat and loam, with some rich decayed manure, and plenty of sharp sand, affording the pots good drainage, and abundance of water when growing. Cuttings will strike freely now in bottom-heat, and soon make nice plants. Cyanophyllum magnificum, which may have grown tall and lost their lower leaves, should be cut down, making the points of the cut off shoots into cuttings, and the lower joints into eyes, if an increase of stock is required. Place the cuttings in sand and peat in a good bottom-heat under a bell-glass, and shade from the sun. Young plants should be potted into good-sized, well-drained pots, using turfy loam, leaf-mould, some fibrous peat, and sharp sand. When growing well, afford liquid manure. The plants should be grown quickly without a check, in abundance of heat and moisture, and be shaded well, to bring out their lovely tints. They are best kept to one stem. Spherogyne latifolia, a good companion plant to Cyanophyllum, does well under the same kind of treatment as regards soil and temperature. Pandanus Veitchii may have the side shoots taken to increase the stock of plants, potting them singly in small pots. Repot any old plant that requires it.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—*All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for contributions, or to return unused communications, or illustrations, unless by special arrangement.*

PLANTS, &C., TO BE NAMED.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.*

LOCAL NEWS.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

ILLUSTRATIONS.—*Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited; but the Editor cannot be responsible for loss or injury.*

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, APRIL 11 { Royal Horticultural Society's Committees, Westminster. Lecture at 3 P.M., on "Orchid Life in Guiana." / Horticultural Club. / National Rose Society.

WEDNESDAY, APRIL 12—East Anglian Horticultural Club.

SHOWS.

TUESDAY, APRIL 11 { Royal Horticultural Society, Drill Hall, James Street, Westminster. / Brighton and Sussex New Horticultural Society (two days).

SALES.

MONDAY, APRIL 10 { Collection of Orchids and Pitcher Plants at Quorn House, Loughborough, by Protheroe & Morris (four days).

TUESDAY, APRIL 11 { Orchids at Protheroe & Morris' Rooms.

WEDNESDAY, APRIL 12 { Lilies, &c., at Protheroe & Morris' Rooms.

FRIDAY, APRIL 14 { Orchids from F. Sander & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—47°.6.

Ice in Hong-Kong.

MR. CHARLES FORD, the Director of the Botanic Gardens at Hong-Kong, obligingly furnishes us with particulars of the unprecedented cold weather which occurred in that island on the 15th to 17th of January. There is no record, says Mr. FORD, when ice has been observed in Hong-Kong below 1700 feet. The result was naturally extremely disastrous, as Hong-Kong lies within the tropics. Mr. FORD specifies the indigenous as well as the cultivated plants that suffered, but space does not allow us to give these details. The photographs which accompanied Mr. FORD's letter show a very remarkable state of things, the plants apparently being covered with a thin sheet of ice.

"The continued low temperature, combined with fall of rain from an apparently warmer stratum of air above, resulted in the formation of ice varying in quantity from a thin coating on the upper leaves of Pine trees growing at 300 feet above sea-level, to a thick encasement of perfectly transparent solid ice of 5½ inches in circumference on the blades and bents of grass at the summit of Victoria Peak. The grass bents themselves, which were the foundation on which the ice accumulated, were not more than an eighth of an inch in diameter, yet the formation of ice was so gradual that with the enormous accumulation of ice, which became its own support, the bents retained their natural upright or but slightly pendent position. These large accumulations of ice were on the windward side of the hill, where rain drifted, but even on the lee side, the average coating of ice was about 3 inches in circumference.

"Evergreen shrubs and trees carried on their leaves solid coverings of ice three-eighths of an inch in thickness. The great weight of this ice caused the branches of trees to assume a pendent form, the strain in many cases causing the limbs to snap off with a crash. All vegetation throughout the hill regions of the colony was thus covered with ice, as were also most other objects. Telegraph and telephone wires from Victoria Gap upwards were covered with ice five-eighths of an inch in thickness, and, in addition, carried icicles as much as 3 inches in length as close as they could be packed side by side. This caused many of the telephone wires to break, and the iron post at Victoria Gap which supported them was snapped off a few inches above the ground.

"The windward sides of the walls of the lock-out house at the Peak were from top to bottom covered with perfectly transparent ice three quarters of an inch in thickness.

"All the hills on the mainland and Lantao Island were likewise white with ice, one of the hills (3147 feet) of Lantao having what appeared to be snow for some few hundreds of feet down from its summit. As early as the evening of January 15, the summit of Taimoshan (about 3300 feet) on the mainland had assumed a whitish appearance, presumably from ice or snow.

"The effect of the extremely low temperature on vegetation has been disastrous.

"The damage in the Gardens consists chiefly in the injury or destruction of leaves, but some plants are quite killed, these being natives of much warmer regions than Hong-Kong. Many of the decorative plants which were not killed will be months before they can regain their ornamental appearance.

"Every possible precaution was adopted to minimise the effect of the cold. The plant-houses, which are provided with screens merely to produce shade, were all matted in and the roofs covered with straw.

"In spite of these precautions, however, many plants suffered very severely. Of Ferns in the houses, Polypodium heracleum and Adiantum tetradactylon suffered most, other kinds being but little affected.

"In the Orchid-house, which was covered with mats and straw, all the best Orchids have suffered very greatly, many being entirely killed, while others were so much injured that, even if they survive, it may be some years before they regain their previous luxuriant state. A healthy plant, received from Calcutta several years ago, of Dendrobium aggregatum is apparently killed, while plants of the same species growing by its side, and also others on trees where they had no shelter, which I collected ten years ago on the Lo-fau mountains, about 60 miles from Canton, have escaped unharmed. This seems to show the capability of the plant in adapting itself to colder regions than it is generally found in.

"In ordinary winters the temperature is too low for many kinds of Orchids and other tender plants. These should be provided with glass-houses in which a little artificial heat could be maintained.

"Tender pot-plants generally were removed to sheltered places and covered with mats.

"The highest point of the Gardens is 320 feet above sea-level; the lowest part, 175 feet. Some plants of the same kinds which were damaged at the upper portions were uninjured at the lower parts of the Gardens.

"Of exotic trees planted on the hills, Albizzia Lebbek, Aleurites triloba (Candle-nut tree), and Eugenia Jambos (the Rose-apple tree), had all their leaves killed at and upwards of 600 feet above sea-level. Trees of the Rose-apple at about 800 feet altitude have been entirely killed.

"At 600 feet altitude indigenous plants began to be affected, the injuries increasing with higher altitude until at about 900 feet, when the extreme limit of low temperature which some plants could bear was reached, and death ensued. Most of these are tropical plants of which Hong-Kong, Formosa, the Luchu Islands in the Far East, and Sikkim and Himalaya in India are the northern limits of the geographical area from which they have been recorded. Of the plants killed or injured, Ficus Harlandi, Benth.; Gordonia anomala, Spreng.; and Garcinia oblongifolia, Champ., are known only from Hong-Kong. Although many of our indigenous plants have not been yet discovered elsewhere, it is to be expected that when China is better known, they will be found over a larger area than the restricted one of this island. The fact of the above-named plants having succumbed to the late frost indicates that when they are discovered elsewhere, they will be found southward of Hong-Kong.

"Considerable damage to vegetation seems to have been caused about Canton, where the alluvial lands are highly cultivated. The Rev. Dr. B. C. HENRY, in a letter dated January 26, informs me that 'The destruction of vegetation about Canton has been very great. The Banana plantations are ruined, and the Bamboos have suffered. The Aleurites triloba look all shrivelled up; while Begonias, Euphorbias, Crotons, and scores of others are simply destroyed.' What Dr. HENRY reports indicates severer weather at Canton than here, as is proved by the reports of the steamers above referred to, Aleurites triloba leaves being shrivelled up at Canton, while they are here at 300 feet altitude uninjured, but at 600 feet here they are affected, and completely destroyed a little higher up the hill."

SCOPOLIA CARNIOLICA VAR. HLADNIKIANA.—The ordinary form of the species is a perennial, with dull-coloured, glabrous, oval, oblong leaves, with solitary axillary, stalked, pendulous, bell-shaped flowers of a livid-purplish colour. The corolla is nearly entire at the edge. The fruit is a capsule opening by a lid, as in the case of Hyoscyamus. The form exhibited at a recent meeting of the Royal Horticultural Society by Messrs. PAUL & SON chiefly differs in the flowers, which are creamy-yellow, and devoid of scent. As an early-flowering hardy perennial, we venture to think that the variety is preferable to the species. It may be comforting to Cockneys to know that the aspirate in the name need not be sounded. The genus is allied to Hyoscyamus, and is not far removed from Atropa or Datura. It has representatives in Austria, Japan, Nipal, and Sikkim.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the society will be held on Tuesday, April 11, when the fruit, floral, Orchid, and Narcissus committees will meet at noon in the Drill Hall, James Street, Victoria Street, Westminster. Mr. EVERARD F. IM THURN has promised a paper on "Orchid Life in Guiana." A large attendance of the outside public is expected.

NATIONAL ROSE SOCIETY.—A meeting of the committee will be held, by permission of the Horticultural Club, at their Rooms, Hotel Windsor, Victoria Street, Westminster, on Tuesday, the 11th inst. at 3·30 P.M.

HORTICULTURAL CLUB.—The usual monthly dinner and conversazione will take place on Tuesday, April 11, at 6 P.M. The subject for discussion will be "Plant-hunting in the Alps," to be opened by Mr. H. SELFE-LEONARD.

SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held on Monday, April 10, when a paper will be read by Mr. T. BRIGHT, on "Underwoods: their Growth and Utilisation." The chair to be taken at eight o'clock.

INTERNATIONAL JUBILEE HORTICULTURAL EXHIBITION, LEIPSIG.—A great exhibition under this title will be held at Leipsig from August 25 to September 5 next, to celebrate the fiftieth anniversary of the foundation of the Leipsig Gardeners' Society.

Spraying Apples.—We take the following summary from the last Report of the Cornell University Agricultural Experiment Station:—"The Apple-scab fungus, Fusicladium dendriticum, attacks Apple trees very early in the season, even before the petals fall to the ground. The first application of a fungicide should be made early, no later than immediately after the petals fall; an application made just before the buds open would probably be of value. The time for combating the Apple-worm is immediately after the petals fall, and the treatment should be repeated once or twice until the Apples begin to hang down. Apple trees should be pruned so that all parts may easily be reached by a spray; well-pruned trees allow free access of light and air among their branches, which prevents fungi from obtaining so strong a foot-hold. The injury done by the Apple-scab fungus was decidedly reduced where the Bordeaux Mixture was used. When Paris Green was added to the Bordeaux Mixture, the fungicidal action of the combination was more marked than when London Purple was used in place of Paris Green. Paris Green has a certain fungicidal value, but in this respect it does not nearly equal the Bordeaux Mixture. The value of Paris Green as an insecticide does not appear to be materially affected whether it is applied alone or in combination with the Bordeaux Mixture. The insecticidal value of Paris Green when used with the Bordeaux Mixture was greater than that of London Purple when similarly applied. More applications are required during a wet season than during a dry one; during wet weather they should be repeated every seven to ten days. The results obtained this season from the application of a combination of the Bordeaux Mixture and Paris Green or London Purple show that the use of such a combination is valuable and practicable for the treatment of the Apple-scab fungus and the Apple-worm, even in a wet season. Some varieties are much more subject to the disease than others. In the preparation of the Bordeaux Mixture, 13·21 parts of slaked lime of the composition are equivalent to 10 parts of quicklime. More copper appears to remain in solution when slaked lime is used than when the lime is fresh. The quantity of copper remaining in solution diminishes rapidly as the liquid is allowed to stand. The action of heat is favourable to the decomposition of copper compounds remaining in solution in the Bordeaux Mixture. The copper is precipitated in the Bordeaux Mixture in the form of hydrate, basic sulphate, and the double basic sulphate of copper and calcium. It is probable that the precipitated copper compounds are affected by the carbonic acid gas of the atmosphere. The solvent action is particularly strong when the copper is in the form of the basic sulphate. *E. G. Lodeman, Assistant in Horticulture.*

Royal Horticultural Society of Ireland.—The following is a list of proposed exhibitions for 1893:—Spring Show, Royal University Buildings, Earlsfort Terrace, Thursday, April 20; Summer Show, Lord Iveagh's Grounds, entrance Harcourt Street, Thursday, July 6; Autumn Show, Lord Iveagh's Grounds, entrance Harcourt Street, Friday, August 25; Winter Show, Royal Dublin Society's Buildings, Ball's Bridge, Thursday and Friday, November 16 and 17.

Fig. 60.—Scopolia carniolica Hladnikiana: hardy perennial; flowers yellow. (see p. 418.)

The New Railway Rates.—A revised schedule of rates for the carriage of merchandise on the South-Eastern and London, Chatham & Dover Railway Companies has just been put into operation. The new charges are station to station rates, and practically amount to a five per cent. increase upon the tariff in force previous to January 1 last. With regard to the rates for empties, sieves and half-sieves will in future be charged for on distances of 25 but not exceeding 50 miles at the rate of 6*d.* per cwt. This is an important concession to fruit growers in the country. Up to January 1 last, sieves and half-sieves

were charged for at the rate of ¾*d.* and ½*d.* each respectively. As thirty-four half-sieves go to the hundredweight, the charge for that number formerly amounted to 1*s.* 5*d.*, whereas it will in future be 6*d.* only, from which 1½*d.* rebate is allowed. The rate for Hops also shows a reduction as compared with the old charge, and thirteen pockets will be carried for the same rate that twelve used to be charged at. The revised rates for drapery, corn, manure, &c., are included in those which have not yet been issued.

Corbridge and District Gardeners' Society.—A well-attended meeting of this Society was held on Monday, March 20, at Corbridge. A paper on "The Minor Lights of the Conservatory during the Winter Months" was read by Mr. Irvine, gardener, Dipton House, Riding Mill, who gave a good selection of plants, with hints as to their respective treatment, which being very interesting caused a long discussion. It was decided to purchase a few books to commence a library, and the Society hope to be able to add a few every year. Two papers are promised for the next meeting, on "Palms and their Uses" and "Peaches;" the usual vote of thanks terminating a successful meeting.

"**Botanical Magazine.**"—The plants figured in the April number are:—

Cattleya iricolor, t. 7287.—A figure of the only existing specimen, so far as is known, of this Cattleya, now in the possession of Baron Schroder. The native country is not known. The leaves are long in proportion to the pseudobulb; the flowers are about 4 inches across, with very narrow linear ob-lanceolate white segments; the lip is convolute at the base; the anterior lobe undulate at the edges, yellow, with crimson streaks.

Carex baccans, t. 7288.—A handsome Carex, in which the fruits as they ripen become succulent and red. It is familiar to visitors to the temperate-house at Kew, but is unknown outside of botanic gardens. It has a wide distribution in South-east Asia.

Satyrium coriifolium, t. 7289.—A terrestrial Orchid from the Cape of Good Hope, with dense spikes of yellow flowers, spotted with red; the lip is at the upper part of the flower, hood-shaped, and provided with a long spur. Hort. Elwes.

Allium kansunense, t. 7290.—A graceful species, with narrow grass-like leaves, slender, erect spathes, with drooping umbels of bright blue flowers. It is a native of Tibet and Western China, and is quite hardy.

Exarrhena macrantha.—A plant with the habit and general appearance of a Myosotis, but the flowers are yellowish, flushed with brown, and the stamens spring from the throat of the corolla between the glands in that situation. Native of the Chatham Isles. Flowered at Kew from specimens sent by J. D. Enys, Esq.

Rose Show Fixtures in 1893.—In addition to those previously noted by us, Mr. E. Mawley supplies the following:—

July 4 (Tuesday), Bagshot and Diss.
„ 5 (Wednesday), Hereford.
„ 6 (Thursday), Farningham.
„ 7 (Friday), Hitchin.
„ 8 (Saturday), Reigate.
„ 12 (Wednesday), Tunbridge Wells.
„ 20 (Thursday), Trentham.
„ 22 (Saturday), Manchester.
„ 27 (Thursday), Halifax.

Mr. Mawley, Rosebank, Berkhampsted, Herts, will be glad to receive the dates of any Rose shows not mentioned above, for publication in the next list of fixtures, which will be issued early in May.

Testimonial to Mr. and Mrs. Dodwell.—Mr. and Mrs. Dodwell celebrate their Golden Wedding on the 20th of this month, and it is proposed by some of his old friends, who have long watched the work done by Mr. Dodwell in the development of the Carnation, and who have very pleasing memories of the social meetings of the Carnation and Picotee Union at Oxford, to commemorate this auspicious event by the presentation of some suitable piece of plate. Individual subscriptions will be limited to 2*s.* 6*d.* or 5*s.* It will save much time and trouble if subscriptions be sent direct to Mr. R. Sydenham, 190, Bristol Road, Birmingham, treasurer of the fund.

Welsh Wine.—The following is an extract from the *Wine Trade Review*:—"We give in our present issue the result of several important sales of wines from private cellars. Some of the prices realised are noticeable, but the most interesting incident recorded is that at the sale at Birmingham of Mr. Lawson Tait's wines by Messrs. Ludlow, Roberts & Weller. Four and a half dozen of wine grown on the Marquis of Bute's Welsh estate were sold at the rate of 115*s.* per dozen. The wine is called the Castle Coch, and it was produced in 1881. From the particulars given in the catalogue, we learn that the vineyard on the Marquis of Bute's estate in the Taff Valley consists of about 3 acres of volcanic soil, favourably situated for the growth of the Vine. It is added that the 1881 wines were exceptionally good, and all were secured by Mr. Lawson Tait. The Marquis' vineyard has been frequently mentioned, but we think it will be a surprise to most people to learn that the produce, even of a good year, is considered to be worth 115*s.* a dozen. If the soil is suitable for an extension of the vineyard, perhaps the result of the sale at Birmingham will hasten the commencement of the work."

"**Orchid Review.**"—The April number contains a continuation of the history of Orchid hybridisation; a figure of Cypripedium porphyrochlamys×; a notice of Mr. Chamberlain's collection at Highbury, near Birmingham; and a great variety of miscellaneous information. The magazine decidedly improves as it grows, and will be highly valued by Orchid growers.

Technical Education: Vegetable Culture.—The Cambridgeshire County Council has arranged with Mr. T. D. Fish for a series of lectures on the above subject, one to be given each week for five weeks in various districts of Cambridgeshire. The following is the outline of the course:

Lecture I.—"Preparation of the Soil." How to make dead soils live and grow good crops. The theory and practice of draining, trenching, digging, forking, hoeing, and manuring. Effects of improved soil—site, shelters. Early cultivation.

Lecture II.—"The Potato." Best Potatos for the million. Improved methods of cultivation. Selection of varieties, early, mid-season, late sorts. Disease-proof Potatos. Times and modes of planting. Mellow soils for Potatos. High cultivation. Checks or cures of disease. Lifting, storing, selling, cooking, and eating Potatos.

Lecture III.—"Onions, &c." Shallots, Garlic, Leeks, Carrots, Turnips, Parsnips, Beetroot, &c., Celeriac, Celery, Salsafy, Asparagus, Rhubarb, Seakale, Kohl Rabi, and other root or stem vegetables.

Lecture IV.—"Green Peas, &c." Broad Beans, Runner and French Beans, Haricots, Tomatos, Marrows, Ridge Cucumbers, Gourds, Spinach, Parsley, Sweet Herbs.

Lecture V.—"Cabbages, &c." Cauliflowers, Broccoli, Brussels Sprouts, Savoys, Greens, Lettuces, Radishes, Endive, small salading, Chicory. Short cuts to profit through the running of two or more crops abreast on the same ground at the same time, such as Broad Beans and Potatos, Radishes and Asparagus, Celery and Lettuces, Peas and Cauliflowers, Strawberries and Onions, &c.

Questions will be freely welcomed and fully answered at the close of the lectures, which will last over an hour. Admission free. All who want to learn are welcome. N. C. Hardcastle, Organising Secretary, Downing College, Cambridge.

Kent County Council.—The experiments committee of the above met at the Horticultural College, Swanley, on March 30, when a lecture was given by Professor Pentland Smith on the life-history and structure of the common Mushroom. Professor Cheshire said that trials of various manures were being made on Beans. These experiments were being carried out by the students. The committee decided to carry out similar experiments with Strawberries, bush fruit, and one of the Brassica family. Various manures were discussed, and it was decided to visit the college grounds, and select land and crops for experiment at the following meeting, to be held on Thursday, April 13, at 5.30 p.m.

GHENT.

The Quinquennial Exposition.—We have visited the Ghent Casino to report to the readers of the *Gardeners' Chronicle* the progress of the preparations for the great flower show. The decorations of the main building are completed. M. Ed. Pynaert, who is responsible for the arrangement of this portion, has drawn up a plan which gives an excellent idea of what the future appearance of this fine hall will be. The ground floor has been arranged as a series of small saloons with mirrors, pictures, carpets, &c.; all these elegant boudoirs—this name suits them better than that of saloon—are differently arranged. They contain antique furniture, columns supporting vases to hold specimen plants, art treasures, &c. The exhibitors may arrange their plants to suit their own fancy. These rooms are reserved for Orchids. Part of the upper hall is reserved for Hyacinths, Tulips, Amaryllis, &c. All is ready and charmingly arranged. The large hall has been managed on a new plan, which will set off the plants and please the visitors.

The annexe will be very fine, and if necessary, thoroughly warmed. Here also, the plan designed by M. Ed. Pynaert has been carried out under his direction. We believe that this part of the Exposition will be a genuine success. Innumerable greenhouses, large and small, surround the annexe. The competitive trials of heating apparatus commenced on Monday, March 27, and will continue for a fortnight. Every day one apparatus is examined. The measures taken by the Administrative Council on the one hand, and by the members of the special jury on the other, inspire full confidence, and enable us to prophesy a satisfactory result. The entries surpass all expectation—so much so, that we would fain hope that all the announced exhibits will not be shown, since it will be quite impossible to stage them all.

Orchids will be the grand feature; never before has there been such a display. Azaleas will be shown in enormous quantities. The competitions for good cultivation will be unexpectedly numerous and good. In fact, the thirteenth Ghent International Exhibition will far outshine all its predecessors. We should also mention that judicious management has ensured the orderly progress of all the work which, without exception, has been most punctually executed. Justice must be rendered to the intelligent forethought and indefatigable zeal of the members of the administrative council and the special commissioners, and particularly to MM. the President, Comte de Kerchove de Denterghem; the secretary, Ern. Fierens, and the assistant-secretary, M. Arm. de Meulenaere.

The Chambre Syndicale des Horticulture Belges invite, on April 15, at 8 o'clock, in the rooms of the ancient Hôtel Communal of Ghent, the members of the jury to a "raout." It will be a brilliant affair. The fine rooms, restored in perfect taste, will be brilliantly lighted, so as to enable the guests to examine the beautiful examples of the architecture of the middle ages. The proceedings will be opened by a reception held by MM. the Burgomaster and the aldermen of the town of Ghent, who doubtless will welcome cordially the distinguished foreigners who will be their guests that evening. *Ch. D. B.*

A letter has been addressed to the president of the Société Royale d'Agriculture et de Botanique by M. Lucien Linden, with reference to the first class of the

first group "new plants" in the programme of the forthcoming exhibition. From this letter, of which a copy has been sent to us by M. Linden, we extract the following. The wording of the schedule is as follows:—

Group 1, New Plants. 1. Six plants in or out of flower recently introduced, and not in commerce.

M. Linden maintains that it should be well understood—

"1. That the 'lots' exhibited should be composed of plants introduced by the exhibitor, and not accidental seedling varieties raised in Europe, such as Tillandsia tesselata foliis variegatis, Vriesia fenestralis variegata, or Kentia Belmoreana var. tenuifolia.

"2. The plants must have been introduced by the exhibitor, and should not be in commerce. Now, a sale, whether of a single plant, or of the whole stock, constitutes an act of commerce. It is the introducer himself who should compete with his introductions (*découvertes*), and, in order that the prize should be awarded to real merit, I am of opinion that the plants should not be borrowed from other firms."

M. Lucien Linden continues, that it is his intention to exhibit six new plants, directly introduced by his firm, and he demands that those who compete with him shall exhibit under the same conditions. He desires to compete with a particular firm, not with a syndicate of plant importers exhibiting under one name. If these indispensable conditions are not accepted, and if competitors exhibit plants which to M. Linden's knowledge are not exhibited in accordance with the above-mentioned conditions, he (M. Linden) will decline to compete, and will exhibit all his plants *hors concours*.

M. Linden recalls the great exhibitions of London in 1866, of Paris in 1867, where Messrs. Veitch brought their plants and M. Linden (père) his, each fighting with their own weapons, and where the vanquished competitor sought revenge in no other way than by redoubling his zeal and activity in his explorations. To these traditional duels M. Lucien Linden desires to return.

It is not for us to speculate on what answer the President will make to this letter, and whether or no the Society will care now to alter their programme, which seems designedly to be framed in a different sense from what M. Lucien Linden would prefer. Of one thing M. Linden may be sure—he will find foemen worthy of his steel; and the Society and the jury may be trusted to see that the conditions of the combat are fairly observed by all the competitors.

As to accidental seedling varieties, they are provided for in Class 2 of the schedule, and by implication, therefore, are excluded from Class 1.

Fig. 61.—CALYPSO BOREALIS.

CALYPSO BOREALIS.

Mr. Elwes exhibited at the Royal Horticultural Society recently a panful of this pretty little terrestrial Orchid, which extends across the whole of Canada from the Atlantic to the Pacific, Mr. Elwes' plants having been derived from Alaska. In the United States it occurs as far south as Minnesota. The root is coral-like, the lower part of the stem tuberous, the single leaf ovate, heart-shaped. The scape 3 to 5 inches high, with a relatively large flower, with narrow-pointed bright purple segments, and a pouch-like lip like that of a Cypripedium, whitish, with reddish-purple and yellow spots, and with two short conical spur-like processes at the lower part.

Mrs. Trail thus speaks of this pretty little Orchid in her *Studies of Plant-life in Canada* (1885):—"The charming Calypso borealis, or Bird's-foot Orchis, with its graceful, deliciously-scented pendulous flowers and crested lip bearded with yellow and pink, and its narrow, twisted, and waved pale-pink sepals and petals; the scape is garnished with one oval, shield-shaped, shining leaf of dark glossy green. It flowers in May.

Home Correspondence.

FRUIT PROSPECTS.—Having just completed a hundred lectures in Cambs, since last October, I am pleased to be able to report favourably on this 28th day of March of the fruit prospects for the current season. On several nights in March there has been as much as 12° of frost. But unless in exceptionally cold and low-lying localities, little or no injury, appears to have been done. Apricots are in full bloom, and Peaches and Nectarines almost fully open. Pears and Plums follow next, and are almost running a neck-and-neck race for the fourth place in order of time. The later these and all other fruits are in opening their blossoms, the safer they are. Gooseberries and Currants are the next in order, and both are most promising. Only a few Gooseberries close by the fog-line, hugging the Cam, are more or less browned in leaf and berry. Currants of all sorts and colours, and Raspberries, also look well. Apples promise a full crop as well as Cherries, though comparatively few of the latter are grown. Strawberry plants have wintered well, and under liberal culture promise a full yield. Considerable efforts are being put forth in various directions to renovate old trees, and plant young ones over considerable areas. The work of beheading, grafting, &c, is in full operation among Plums and Pears; and scions of the best Apples, such as Blenheim Orange, Cox's Orange Pippin, Bismarck, Warner's King, &c., are being laid-in in quantity for working on the heads of old trees or new stocks so soon as the sap is in motion. Much yet remains to be done in the county. Nevertheless, an awakening is seen and felt in all directions as to the importance of fruit growing as a source of food, and as a means of pleasure and profit. *D. T. Fish.*

THE VIOLET PLUM OF EAST ANGLIA.—Considerable mystery hangs over the Violets of different growers which it seems desirable to clear up, to the substantial advantage of intending Plum growers. The other day the writer came upon a grower who had just been grafting all his inferior sorts with Violet Plums, for the all-sufficient reason that while frequently he could not get more than eighteenpence a bushel for common Plums, he could mostly get 10*s*. per bushel for Violets. Now, the growers, as well as the consumers of Plums, are almost alike interested in knowing whether these Violet Plums are purple or Violet Gages, hence Claude Violette or the early blue Plum, Azure Hatif, or yet another variety known as the Royal Hative. As the Violet Plum of commerce is ripe before the Green Gage, which ripens in orchards about the middle of August, it can hardly be the Purple Gage, which seldom ripens until September. The so-called Cheston Plum has also been called Violet, as well as several Prunes; this ripens in August. But then the most generally grown in Violets are early, and mostly raised from suckers, after the manner of Gages. The Jerusalem, the Imperatrice, the blue Perdrigon, Prince de Tours, Queen Claude, and other purple Plums have been called Violets. Which is the true Violet out of so many? Any information as to the true Violet Plum of commerce, and where it could be had true in quantity, would greatly oblige *An Anxious Enquirer.*

BROCCOLI.—This, for the last few years, has proved a provoking crop, especially where a supply of vegetables all the year round is wished. From time to time different varieties are recommended as being especially hardy, &c., but on trial, fail to stand the test of a sharp winter. I am glad to say I am somewhat differently placed to "W. A. C.," inasmuch as I have a very fair lot which have escaped the frost this year, contrary to the two previous seasons. I must, however, say they are rather small. I had all the largest laid down, but in spite of this they were killed or crippled, and the latter have thrown heads about the size of a button. Those I left standing had been planted between the rows of Peas and Potatos, and included Knight's Protecting, Late Queen, and Backhouse's Winter White, and they have been successful in the order I have placed them; the first two have lost only here and there a plant. I tried several others, but those I have named are the best. *W. G.*

SPINACH.—Exactly the same has happened here with regard to Round and Prickly Spinach, as recorded by "A. D." I, too, had always been under the impression that the Prickly variety was much more reliable for winter use, and was rather put about at the time I should have sown it to find I had

neglected ordering the seed. Fearing I might be behind, I decided to make a sowing of the Round whilst waiting for the others to arrive. This, I suppose, was about a week afterwards, and both were sown on the same patch; neither were thinned. The frost did no harm to the Round, beyond cutting a few of the outside leaves, whilst of the Prickly quite two-thirds were killed outright, and the remainder look miserable, but I have had several dishes from the Round. This I think proves clearly enough that it is not the Prickly, but the Round, that is best for standing the winter, and that all this time we have been "sailing in the wrong boat." *W. G.*

DANDELION AS A SALADING PLANT.—Dandelion is by no means a favourite plant with gardeners, who, in a general way, treat it as a noxious weed. Yet the plant is well deserving of cultivation as an ingredient for salads. I need hardly say that the plant is of very easy culture, and possesses a fine hardy constitution. Nevertheless, it pays well for good culture and generous treatment, as the stronger the roots and crowns of the individual plants are by the fall of the leaf the finer will be the specimens of blanched growth obtained therefrom during the winter and spring months, and which, when used in connection with Chicory (Barbe de Capucin), and Lettuce, make a first-rate and very pleasant salad. My employers are so partial to Dandelion and Chicory, that I consider a good supply of both of quite as much importance as of Lettuce and Endive. The seed should be sown thinly early in April, in drills about 1 inch deep, and at from 12 to 15 inches asunder, closing the soil over the seed, treading and raking level, afterwards thinning the plants out to 6 or 9 inches in the rows. When the plants have shed their leaves, some of the roots may be taken up and placed 3 or 4 inches apart in boxes, working any kind of light soil about the roots up to the crowns, watered, and then put into a Mushroom-house or any place where light is excluded, and a temperature of from 50° to 55° is maintained. Failing a Mushroom-house, the boxes might be placed in a vinery, Peach-house, or under the greenhouse staging, placing inverted boxes of like size over them to keep out the light, and thereby insure the production of good heads of perfectly blanched, crisp and slightly bitter growth. Batches of roots should be treated as described at short intervals throughout the winter and spring months, so as to maintain a good and regular supply. On the approach of severe weather, the ground wherein the plants are growing should be covered with dry leaves or Fern to enable roots being taken up for forcing as required. *H. W. Ward.*

STRAWBERRY JOHN RUSKIN.—With me this is a total failure. I am growing it side by side with Vicomtesse and La Grosse Sucrée. It came into bloom weeks ago, is still blooming, and is likely to keep in bloom. It is smothered with mildew; and, although I have about 500 plants, I shall not gather 1 lb. of fruit. To call this an early Strawberry is nonsense. My Vicomtesse and La Grosse Sucrée are free from mildew, and doing very well. I am now about to throw away all my John Ruskin, and to look upon it as a dismal failure. I should like to know how some of your other readers have fared with this variety. *R. C.*

THE DAFFODIL SEASON IN THE SOUTH OF IRELAND.—The season has been one of the earliest on record. Ard-Righ, Golden Spur, and Henry Irving were all plentiful out-of-doors at the end of January, more particularly the former; I never force any. The White Swan's Neck bloom commenced February 10, the first of which to appear being the big form of cernuus, known as Bishop Mann. There are three distinct growths of cernuus proper here, viz., Butterfly, Bishop Mann, and cernuus proper, the latter a short thick-set bloom, and very early. In some sickly soils near London, the fixed character, as it appears here, is not distinguishable, and this is so with most varieties. To give an instance, I never at any of the London exhibitions saw the frilling on that lovely Daffodil, Trumpet Maximus, so beautiful as it appears in my garden; and this season, the one I call Maximus superbus longivivens (!), which was gathered wild in the South of France, is magnificent. The bloom now is nearly over, and before Easter, all that had grown out-of-doors, so far as Ard Cairn is concerned, disappeared to the market. The Leedsii incomparabilis and Barrii varieties are beautiful, particularly Leedsii, Duchess of Westminster, Gem, Minnie Hume, and Catherine Spurrell. I never saw the red more marked in Barri conspicuus and M. Vilmorin, C. J. Backhouse, and Mary Anderson. But, after all, I am not surprised, as the deep rich maiden limestone soil suits them, and the weather has been so exceptionally fine for six weeks, the most favourable, perhaps, in living memory; indeed, the temperature out-of-doors this morning can compare with the balmy atmosphere of June—heavy dews overnight, and intense heat during the day. To give an instance, Narcissus muticus is in flower, and the Horse-Chestnut in full leaf, and nearly in flower. There are two varieties here of which a stock is being worked up, viz., Ione and Jenny Woodhouse, and it will be a race of Goths and Vandals that will obliterate their existence. A clump of Madame De Graaff appears this morning with three blooms; it might have been called White Maximus, so truly noble and stately. *W. Baylor Hartland, Ard Cairn, Cork.*

RAISING AURICULA SEEDS.—Patience on the part of anyone attempting to raise seeds of Auriculas of high quality, is highly necessary. Seeds of common strains of this favourite flower germinate quickly, but the higher the quality, the more slowly does germination occur. I am just now experiencing that this is so, for a year ago, desirous of procuring a few seeds of Auricula of the highest quality, I obtained from Mr. J. Gibson a few grains from a plant of a fine grey edge named Marmion, saved in 1891. I reserved for my own sowing a dozen grains, and forwarded the remainder to my customer. They were sown at once as I directed, and three months after I received a letter stating the seeds did not germinate; I wrote back counselling patience, but I have had no communication since. The seeds I retained were sown directly they were received, on the surface of a well-drained pot of light soil, and stood in my Auricula-house, with a piece of glass over it. Knowing the slowness with which such seeds germinate, I waited patiently for results, and now nearly a year after the seeds were sown, they are germinating, and I am hopeful I shall get a plant from every one. This experience justifies the advice of our leading raisers of new Auriculas, who make a practice of keeping their seed-pans two and three years, as seeds are found to germinate successionally, and some of them quite late in point of time. More than that, it is said the quickest plants are often those of inferior quality; the latest produced give the best flowers. Patience is necessary in raising seeds of most of the Primulaceæ. I find it requisite in the case of coloured Primroses and Giant Polyanthus, the seeds of many of which being slow in germinating, and as in the case of the Auriculas, these are varieties of the highest order of merit. *R. D.*

NARCISSUS CYCLAMINEUS AND N. MAJOR.—I was surprised, when reading "V.'s" notes from Kew, that he recommended Narcissus cyclamineus and c. major to be grown in a moist boggy peat. I find in our climate we are unable to keep the bulbs sound in an undrained bed; but where the ground is well drained, either with roots or stones, they grow and increase well. One place here in particular, at the foot of a large Cypress hedge, is a beautiful sight every year, and I notice the bulbs which are close to the hedge roots produce the best and largest flowers, and the blooms gradually get smaller towards the front of the border, where it is more moist. The bulbs at the base of the hedge only get moistened in winter by the snow, as the place is so situated that little or no rain can reach them except from thunderstorms. We have Narcissus cyclamineus in several places all under similar circumstances, and they do well. I thought that our experience here, so totally different from "V.'s," might be interesting to some of your readers. *W. A. C., York.*

HOLLY AND OAK.—Referring to the case of the Holly growing through an old Oak, p. 364, I may mention, that although it is rather phenomenal, it is by no means unique. During last summer I visited Killin, at the other end of Loch Tay from here; and, among other things of interest to be seen in the locality, there is an example of a very similar nature to the Holly and Oak, viz., an Ulmus montana, or Wych Elm, growing from a Sycamore. Cases of trees growing from clefts of branches are not uncommon; but the case I refer to is rather remarkable, as the point of union at the present time is practically similar to a graft, as the Elm issues from the side of the Sycamore, and not from the cleft of the branches. Judging from the appearance of the two trees, the Elm grew from seed from the cleft, and the young wood of the Sycamore had gradually grown over the point of union, and has left the Elm to fulfil a similar function as the Holly referred to, when the Sycamore decays; but the Sycamore seems to be quite sound in the meantime, and is about 250 years of age. Of course, the estimate of the age of the tree is only approximate, as the tree is mature, and therefore difficult to estimate without being felled. It grows by the side of the road leading from Finlarig Castle to Killin Pier, and is an object of great interest. *Robert W. Milne, Fortingal, Glenlyon, Perthshire, N.B.*

CAMELLIAS IN FRUIT HOUSES.—Anent the note by "A. D.," p. 267, as to Camellias flourishing in vineries, I know from experience that they do remarkably well in such houses. At Liscard Hall, Cheshire, they were a splendid sight a few years since growing in this way. An early lean-to Peach house afforded the earliest blooms. The back wall was about 14 feet high, and was covered completely with the best varieties. This Peach-house had a southern aspect; other houses, mainly vineries, facing east, had their back walls covered in the same way. No trouble was evinced in getting the Camellias to flourish in the moist heat required for the regular occupants. Camellias are less addicted to insect-pests than many other flowering subjects, and being evergreen, they are specially adapted for this purpose. *E. M.*

CANNING.—In reply to the query of "J. B. W." which appears on p. 303 of the issue for the 11th ult., I may say that *The Secret of Canning*, to be had of the Rural Publishing Co., Times Building, New York, will probably suit him. The price is 5 dols., and the author's name is Schwaab. *Michael Barker, Cambridge, Mass.*

STRIPED CROCUS.—The striped yellow Crocus mentioned by my friend Mr. Baker was not raised by seed, but picked out of a batch of the commercial Dutch yellow Crocus, which I have always found absolutely barren. A striped yellow aureus is alluded to as existing in the Banksian herbarium, *vide Crocorum Synopsis (Herb.)*, pp. 37, 38. The wild aureus seeds plentifully here, and has produced many varieties, including a pure white. *R. H.*

LACHENALIAS.—No one can mistake Lachenalia aurea, with its broad, short, recumbent, spotted leaves, for any other species, and Mr. Todd's plant is, no doubt, a large variety of that species. What my plant may be I cannot say, but the plant is not distinguishable from that of L. luteola or L. Nelsoni. The plant which Mr. Todd mentions, with dark green upright narrow leaves, which I have also from Mr. O'Brien, is a different thing altogether. *C. W. Strickland.*

ERITRICHIUM NANUM.—This afternoon I had the pleasure of seeing Eritrichium nanum in blossom in the York Nurseries. It was growing on a little artificial slope (outside the long house in the Alpine Nursery), made with slabs of stone, and a compound of grit, peat, and loam, arranged in tiny terraces, with a projecting slab at the top. An old frame-light had been kept over it during the winter to ward off rain. The plants showed dozens of flower-buds, and will in a day or two present such a sight as is rarely seen in an English garden. The last time I saw the plant was at a height of 11,000 feet above the Roccia Viva glacier in the Eastern Graian Alps. There, in company with Petrocallis pyrenaica and Ranunculus glacialis, it flourished in perfection. It is so seldom one sees this Forget-me-Not-like beauty in good flower, that, doubtless, any of your readers who may be within reach of the York Nurseries, will be glad of the opportunity of paying their respects to it. It was also coming into flower on the Rockery, but did not look quite so happy there. *G. Yeld, Clifton, York, April 4.*

ODONTOGLOSSUM WILCKEANUM. — Having during my twelve years' Orchid experience in growing, flowered but two of this much-esteemed hybrid, I should be much obliged if other cultivators would give me their experience and dates of the sales, or origin of the importation of it of which they have flowered theirs. Some importers say that it cannot be bloomed out of the round forms of O. crispum, as O. luteo-purpureum, its other parent, does not grow near them, but in close proximity to the starry forms. Certain it is that I have bloomed these two plants from a decidedly "starry" lot (which also produced two O. Coradinei, and a yellow crispum). Then, again, I once bloomed a fine O. hystrix from another "starry" lot; and finally, I am now opening some O. luteo-purpureum, that result from an importation of crispum and triumphans (which I knew were luteo-purpureum under another name), which are also of the "starry

sphere." Then these cases go towards proving the truth that O. Wilckeanum does not come out of the "round crispums;" but I am but one among the many who have bloomed it from imported plants, and I should much like to hear the results of others. Occasionally one sees at the sale rooms a plant under the name of O. luteo-purpureum, that has its sepals strongly barred with yellow, and the brown therefore largely broken up into the blotches that identify O. Wilckeanum. This to me indicates a touch of O. crispum; "just frightened by it," as a well-known orchidologist said to me lately in conversation upon a doubtful hybrid. Then the next mark is the altered form of labellum, and absence of spots and marks of luteo-purpureum in the petals; and so we go on till we get a fine O. Wilckeanum. These details to those who only care for the possession of the plants may appear superfluous, but they are worthy of note by those who make Orchids a study. *De B. Crawshay.*

Fig. 62.—HYBRID NARCISSUS, CERNUUS × TRIANDRUS.

THE ORCHARD HOUSE.

Indoor Treatment of Pot Plums and Pears.—We commenced the culture of these fruits in the second week in March by removing them from the bed of coal-ashes in which they had wintered, and protected by means of nets from sparrows and bullfinches. Before being put into the orchard-house, the pots are washed and their drainage-holes cleared if found to be stopped. When in the house crowding must be avoided, as free exposure to air and light is of vital importance to ensure success in facilitating the setting of the flowers and ripening of the fruit, and in fully maturing of the new shoots. I put the pots upon a bed of anthracite coal-ashes, with a coating of soot under the pots, which perfectly excludes worms. Until the flowers begin to expand, the trees are syringed morning and evening on days that are bright, and air is more or less freely afforded according to the state of the weather. In order to avoid aphis attacks, the trees at this period are fumigated with tobacco-paper immediately before the first flowers open. Artificial heat is not needed until the trees are in blossom, and then only enough is afforded to slightly warm the hot-water pipes. By this means the pollen is kept dry enough for its purpose, while greater warmth might enfeeble its vitality and that of other organs, and besides, it would certainly weaken the growth of the wood. Syringing is discontinued during flowering; a continuous and free circulation of air is maintained, and this is very essential for the Pears, which are neither so free in flowering, or certain in setting as Plums. Here I find the bees useful insects in disturbing the pollen, although we do not trust to them entirely in the case of the Pears, but make use of a camel-hair brush, and even with this aid to fertilisation, a full crop is not always secured; although, I think, some of this may be due to our house being insufficiently ventilated for Pears. Someone has intimated (and, I believe, it was Mr. Rivers) that the more shaky a Pear-house is constructed, the more certain the crop; and, doubtless, profit might be derived from the hint. [The elder Rivers, we believe, liked houses with hedges instead of solid walls for these fruits. Ed.] Once the fruit is set, syringing is resumed, and fire-heat discontinued except in wet or cold weather, when the pipes are warmed to maintain buoyancy and prevent the atmosphere becoming too damp. Plums which usually set thickly, are partially thinned as soon as they begin to swell, and, finally, when they have stoned, this method being better than leaving the thinning till the stoning period. The first thinning is freely done; In the case of Pears, what thinning is wanted is attended to when they have begun to swell freely, when the smallest fruits are removed from the clusters.

Pruning consists of stopping the young shoots to two or three leaves, and this is done piecemeal, so that no check is caused, as would be if a general shortening of growths was done at one time. This close stopping is practised on full-sized trees, such shoots are left on young ones as will form a good head. Watering should receive diligent attention, Plums and Pears being strong rooters, and root-action very active when in full leafage, and the trees carrying crops of fruit; lack of water at such times has the most disastrous results.

The trees require much manurial assistance whilst in bearing, and from the time that our trees are placed under glass until the fruit begins to swell, they are carefully supplied with weak liquid-manure water; and from this stage till the fruit commences to ripen, the strength of this is increased, and an occasional dressing of chemical manure is also applied, and the soil is top-dressed with horse-droppings. As soon as the fruit shows signs of ripening, the syringe is laid aside, and the house opened to its fullest extent. Greenfly, which is often troublesome on Plums, is kept under by fumigating with tobacco whenever it makes its appearance. A good many varieties are grown, and the best Pear is Doyenné du Comice, and the best Plum Coe's Golden Drop. *Thomas Coomber, Hendre Gardens.*

HYBRID NARCISSUS.

The illustration we give at fig. 62, shows one of the many interesting hybrids raised by the Rev. G. Engleheart, and shown by him at the Royal Horticultural Society on March 28. The flower in question is from N. cernuus, a white Daffodil, by N. triandrus. The flower was of a pale creamy-white, and very beautiful. We refer to p. 395 for a further notice of this interesting cross, and we trust Mr. Engleheart will persevere in his interesting experiments, which not only result in the addition of beauty to an already beautiful genus, but which are, from the care and judgment displayed, important for scientific purposes also.

KEW NOTES.

The Hardy Plant-house.—A charming house of hardy plants at Kew is seldom seen by visitors, owing to its position. It is placed at the top of the herbaceous ground, and is full of interesting and rare alpines, and general hardy or tender plants. During the months of April and May there is a succession of flowers, and the place has been gay since Christmas. But it is in the two months mentioned that those who care for hardy flowers should visit it. At the present time Daffodils in pots are largely represented, a large number of alpine Primulas, Megaseas, Epinediums, the yellow-flowered Morisia hypogœa, Erysimum ochroleucum helveticum, Muscaris, Shortia galacifolia, and many other good plants. This house is one of the recent improvements at Kew, and we do not know of another feature like it in any garden. It is certainly a success, and may be kept bright with flowers throughout the year.

Lachenalias.—A group of Lachenalias is in flower in the Cape-house. Gardeners have not yet learnt that there is more than one kind, as one constantly finds only L. tricolor grown, notwithstanding the other fine forms in cultivation. L. Nelsoni is the most beautiful of the group, and a good plant shows its freedom, beauty, and richness of colour. If the late Rev. John Nelson, who did such good work with the Lachenalia, had raised no other than this beautiful hybrid, his name would be remembered. The plant is very robust, and free, which cannot be written of L. aurea, although the flowers of this are richer in colour, but there is no comparison between the two plants as to their usefulness for the greenhouse. The scapes of L. Nelsoni are borne in abundance, and it is not unusual to find about eighteen of the large, fine-coloured flowers, which make up effect when the specimen is large, the leafage being correspondingly vigorous. At Kew there are several very interesting crosses, one group of plants being the result of L. Nelsoni × L. versicolor, and another L. Nelsoni × L. tricolor, and the plants have retained the vigour and beauty of both parents, the scapes strong, and the flowers individually large, abundant, and of good colour. This is evidently a

fine race, and we should like to see it get into gardens. A curious but not beautiful Lachenalia is L. reflexa, which is the same as Drimia lanceolata, and introduced in 1774 from the Cape of Good Hope. This reminds me that the species of Lachenalia are very old introductions. L. luteola was introduced from the Cape about the same time; also L. quadricolor and L. tricolor. The Rev. Theo. Marsh, of Cawston, has raised several interesting hybrid Lachenalias, making use of L. Nelsoni as one parent. Hybridists will find this hybrid good in every way, possessing a constitution of great vigour, freedom, and richly-coloured flowers. *V.*

Nursery Notes.

Messrs. J. Laing and Sons.

Whilst the fog hung over London, literally a pall of vapour black as night, the sun was shining out in summer-like glory at Forest Hill, as we paid a visit to the famous Begonia nursery there. But with the exception of some of the winter-blooming section, it was not and is not now the time to see Begonias in their beauty, although opening the doors of some long houses here and there revealed literally hundreds of thousands of seedlings pricked off into shallow boxes, and gave to the houses a pleasing verdant aspect. Every year, so enormous is the demand for tubers, is it found needful to increase the stock of seedlings, which at present seems to be innumerable. These will make the now fallow acres of land, usually devoted to their out-door development, look gay with lovely colours next summer as only Begonias can do. But whilst Begonias may be the firm's distinguishing floral specialty, especially in the summer, they are not the only ones. Cliveias at this time of the year make a very beautiful display, and it would seem as if Messrs. Laing & Sons had got a good lead in this exceedingly effective class of greenhouse plants. There is of them a huge stock of divers sizes, and of many varieties. Short a time as the Cliveia has been in hand as a popular greenhouse flower, some thirty-six sorts of divers colours and degrees of merit have been put into commerce, and others yet classed as seedlings, but very meritorious, will join that small army so soon as stock can be procured. That is naturally a slow process, but suckers are, when but a few inches in height, taken off, and rooted as cuttings, in that way making good plants quicker than if left to root in the old pots. Not only are there numerous seedlings blooming, or about to do so, but other crosses are being every year made; and, happily, the Cliveia is a plant that does not give all its best form or colour at once, and there is ample room for the production yet of even finer flowers than has Lady Wolverton, of deeper colour than has the very rich John Laing, primrose or yellow shades purer than Salmonia or Sulphurea give, and it is not too much to hope that even a pure white form will presently eventuate. Now, Cliveias are very accommodating plants, and if pushed on in a little warmth, may be got into bloom early in February, and then later in the year these plants will bloom again, indeed most of them flower twice in the year. They thrive well in an ordinary greenhouse temperature, but must have rather higher warmth to induce early flowering. They like a soil that is about one-half good sweet turfy loam, and the rest good sweet peat, or leaf soil and sharp sand. It is best not to intermix animal manure, but some liquid manure may be given during the growing season, and especially when bloom heads are being developed. Seedlings need much patience, as plants do not as a rule flower under four years, but they are so valuable when obtained. The firm saves seed from the best varieties, and offers it for sale, so that the raising of seedlings is comparatively easy. It is best to sow in all cases so soon as ripe, but even if the seed be put into moderate bulk, it will soon heat and promote germination. The plants are easily kept clean, the flag-like leafage facilitating that process readily. The blooms are specially effective when gathered singly and wired or used in bouquets, the salmon or carmine tints usually harmonising admirably with other flowers. A few of the best varieties at Forest Hill are Lady Wolverton, so far the finest flowers, of an orange-carmine hue, with a white throat; John Laing, very brilliant orange-scarlet, flowers of perfect form, the most striking for depth of colour yet seen; Mrs. Laing, very fine form, colour deep orange-red, with a pale lemon throat; Purity, very bright orange; Purpurascens, a flower of great beauty, colour, light orange, distinctly shaded with violet, a very lovely variety; Salmonea, orange-scarlet, tinted with salmon, and having a yellow throat; and Sulphurea, colour, pale sulphur. These are a few, and they suffice to indicate the directions both in diversity, colouring, and form, which the Cliveia is assuming. Another undoubted specialty at Forest Hill, is the Caladium; for here is to be found one of the finest collections in the kingdom. Not only are some 300 divers forms catalogued, but these are being yearly added to; although it would seem almost as if the full development of leafage was reached so far as colouring was concerned. What wonderfully beautiful markings do the leafage show, infinitely varied, and vieing with the loveliest of flowers in attractiveness. We did not care much for some of the large-leaved varieties, especially those that were of very thin texture or lacked colour, medium-sized shields, of good substance, showing that they will bear exposure and travel, seem not only best, but much the prettiest.

Of varieties that seemed the most beautiful to our liking are:—Louis Van Houtte, red and bronze; Gaspard Crayer, red and green; Chactas, deep red, margined green; Leopold Robert, rose, white, green, and carmine-coloured; Triomphe de l'Exposition, crimson centre, red ribs, green border; Mrs. Laing, white, veined deep rose; Reine de Danemark, delicate rose, network of green; Raymond Lemoinier, cream, white, and carmine; B. S. Williams, deep rose, veined carmine; Candidum, white and green; Apelles, deep green, broad red ribs; and Madame Groult, rosy-red, with intense green border. This is a very beautiful selection. The cultivation of Caladiums is simple; they like a fairly moist heat, with some thin shading in hot sunshine. Pot lightly in a compost of two parts turfy peat, one part turfy loam, and one part silver-sand, giving plenty of drainage. Liberal waterings, with occasional ones of liquid manure, may be given after the pots are well filled with roots. Messrs. Laing strongly advise that the bulbs should be in autumn dried off very slowly, but the soil must not be allowed to become dust-dry, as otherwise the bulbs will die of dry rot. In one corner of a large greenhouse is a plant of the Coffee tree, Coffea liberica, in fruit. Calla Little Gem is very abundant here, and the new yellow varieties, Elliotiana, and auratum, are being rapidly increased. A charming greenhouse climber, and far too seldom met with, is Manettia bicolor, of which there is here numerous plants. The flowers are tubular, in colour scarlet edged with yellow. Very attractive is a great quantity of the pretty silver variegated Saxifraga sarmentosa bicolor superba, one of the liveliest little plants for greenhouse rockeries or baskets. Sibthorpia europæa variegata is another pretty little bunch or trailing plant, that would prove very useful for a similar purpose. Naturally, in a large nursery such as this, there are hundreds of things meriting attention, indoors and out in the frames, where there is a big collection of hardy plants, to which now we cannot make further reference.

Flowers at Holloway.

In the spring-time each year, Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, hold an exhibition of the flowers of the season, to see which, many of their country clients arrange a visit to the establishment. The display just now, owing to the clear weather, is more than usually fresh and bright; the Amaryllis, for their fine strain of which the firm are noted; the Cliveias, the splendidly-grown collection of Hyacinths and Tulips which nearly fill two houses; the Indian Azaleas, and other forced plants make the chief display; and to these may be added the New Holland plants and Orchids, whose supply of showy and interesting flowers at these nurseries fail not at any season of the year.

Taking the house of Amaryllis (Hippeastrums) first, we find it filled with a large and varied stock, the central bed thickly furnished with flower-spikes in all stages, which will give a fine show for some weeks to come. The scarlets and crimsons are specially good, and of them Dr. Masters still remains one of the best of the medium-sized flowers; Emperor Frederick is a large light scarlet, with a light eye; Marshalliana, a fine scarlet, with greenish centre; Maiden's Blush is creamy-white, beautifully veined with orange-scarlet; and Ophelia is one of the most beautiful novelties extant, its large perfectly-formed white flowers being quaintly feathered in the central half with dark crimson, leaving a clear broad white tip and margin to the segments, very attractive, and unlike anything we know. Passing to the Cliveias, or Imantophyllums as they are sometimes called, we find a rich display of flowers borne on large and well-grown plants. Different shades of orange, or orange on white, form the bulk of the colour, but in this there is a very great range, Cliveia aurantiaca being what may be called white shaded with orange, while C. Meteor, Prince of Orange, and Ambroise Verschaffelt are dark orange or orange tinted red. Mr. Williams says it is one of the most useful of flowers, for it forces gently so as to flower even before now, while other plants of their stock are either brought on or retarded so as to continue the show of them for some months.

The Hyacinths and Tulips are always well grown at Holloway, where formerly all the new and expensive kinds used to be tried; but it was found that growing novelties in Hyacinths meant in many instances excluding better and cheaper proved sorts, and now they are grown to represent the best known kinds, and to offer facilities for their numerous bulb customers to make selections for the next year. Ranged right and left of the span-house in which they are grown, their fine heads of bloom and healthy foliage well set-off by the green moss-surfaced pots, they give a fine effect, and where all are so good, selection is difficult. Specially fine we thought Pelissier, a very dark bright red; Moreno, a fine salmon-tinted flesh colouring; Von Schiller and Roi des Belges, fine; Koh-i-noor, a rich pink; Cavaignac, blush-white with carmine stripe; Marchioness of Lorne, chamois colour, striped with red; King of the Yellows, Ida, and Obelisque, all good and various shades of yellow; King of the Blues, a real good blue; and Charles Dickens and Lord Derby, good light blues; King of the Blacks, as nearly black as possible; and Mont Blanc and La Grandesse, still two of the best whites; while everywhere throughout the collection the proved favourites give good reason for the favour bestowed on them.

Turning to the Tulips, we find the same rule holds good, the Pottebakkers, white and yellow, being prominent; so also Joost van Vondel, and the beautiful white form of it. Vermilion Brilliant, Keiser's Kroon, Rose Gris de Lin, Murillo, and Velvet Gem also show up well, and the whole collection is useful, showy, and interesting.

Other good displays are made by the different species of Acacia, the large specimens of greenhouse Rhododendrons beginning flower for the season; the rich orange Burchellia capensis, the fragrant white Gardenias, the scarlet and variegated-spathed Anthuriums, and the various odd plants in flower always to be found in the general collection of this well-appointed old nursery, and by the interesting display of graceful frondage in the ferneries, which are as attractive to many as the flowering plant-houses.

But we must not leave unmentioned the Orchids, which form the leading all-the-year-round feature here. A glance at a few of the things in flower shows us in the first house a lot of Calanthe Stevensii, and the darker and handsomer C. Wil-

liamsii, with well-flowered specimens of Cymbidium eburneum. In the next, Lælia flava, good specimens of Cœlogyne cristata alba, and of Cymbidium Lowianum, one of which has ten spikes, one spike bearing nearly fifty flowers. With these are Cattleya Trianæ formosa and C. T. Arnoldiana—two grand flowers; many Lycaste Skinneri, Maxillaria Sanderiana, Cochlioda rosea, Pleione humilis, Platyclinis glumacea, Trichopilia suavis, and near the door an immense specimen of Cattleya Lawrenceana with seventeen flower-sheaths. In another house is an arrangement of Dendrobium Findlayanum, with the really fine and distinct Dendrobium infundibulum giganteum, some Vandas, among which V. tricolor formosa is conspicuous; Calanthe veratrifolia, C. masuca, Dendrobium nobile majus, and D. n. Sanderiana, both good, and richly coloured.

In the cool-house is the beginning of a good show of Odontoglossum Pescatorei and O. crispum, with a good sprinkling of O. triumphans, varieties of O. luteo-purpureum, O. aspersum, O. Wilckeanum, O. prionopetalon, Masdevallias, &c.

Among the Cypripediums the varieties of C. Sallieri × are giving a rich display; C. Williamsii × is distinct and showy, and C. Amesianum ×, C. Pitcherianum × Williams' var., C. Peetersianum ×, C. Fitchianum ×, C. politum ×, C. Leeanum ×, C. Morganiæ ×, C. Bartetii ×, C. Euryandrum ×, C. Boxalli splendens, C. cardinale ×, C. grande ×, C. porphyreum ×, C. Rothschildianum, and others are in bloom in more or less quantity. Other interesting and pretty plants in flower in the Orchid-houses are Angræcum Sanderianum. Ornithocephalus grandiflorus, Dendrobium Leechianum ×, D. endocharis ×, Ada aurantiaca, Lycaste gigantea viridis, Cypripedium hirsutissimum, Day's original variety, a noble and well-defined form, &c. In the foliage plant-houses, the coloured leaves are as bright as flowers, and the Pitcher Plants and Sarracenias are interesting. In the greenhouse are a grand lot of specimen Lapagerias in pots, which will give a great show of flowers in their season.

Law Notes.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN *v.* MESSRS. JAMES COCKER & SONS, ABERDEEN.

It may be recollected that shortly before the Royal Horticultural Society of Aberdeen held its summer show in the Central Park, Kittybrewster, Aberdeen, in August last, Messrs. James Cocker & Sons, rosarians, Aberdeen, raised an action against the office-bearers of the society to have them ordained to receive certain exhibits of Roses and Dahlias which Messrs. Cocker had tendered, and which the committee had refused. Messrs. Cocker had been members of the society for many years, and had been in the habit of paying their subscriptions when the collector called for them, but a rule of the society prescribed that all competitors to the show must be members, and subscriptions paid on or before August 1, and the committee put forward this rule as their reason for excluding Messrs. Cocker's exhibits, although their subscriptions were tendered on August 4. Notwithstanding the previous practice of paying the collector when demanded, Messrs. Cocker alleged that the desire to exclude them arose in retaliation for their having supported the Duthie Park Floral Fête—a fête promoted by those members of the Royal Horticultural Society who disapproved of the Society abandoning their old site in the Duthie Park and going to the Central Park with the summer show. The committee replied that they understood Messrs. Cocker had withdrawn from the Royal Horticultural Society, and on that footing they had invited firms from the south to exhibit Roses, &c. The action first came before Sheriff Robertson in the Aberdeen Sheriff Court, who decided that on the strict construction of the rules of the Society, Messrs. Cocker were not entitled to exhibit, and he therefore dismissed the action. Messrs. Cocker appealed to the Sheriff-Principal; but the hearing of the appeal was delayed in consequence of a proposal having been made for a friendly settlement of the matters in dispute. Ultimately, however, the proposal made by Messrs. Cocker for a settlement was rejected by the Society, and the appeal was accordingly heard by Sheriff-Principal Guthrie Smith at his last sitting. He has now given judgment, recalling the Sheriff Robertson's interlocutor of August 15, 1892, repelling the three first pleas in law for the defenders, and finding that it is now unnecessary to pronounce any order under the petition, finds the pursuers entitled to expenses.

In a note, the Sheriff-Principal says:—"The pursuers allege that, being members of the Society called as defenders, they were entitled to have their flowers shown at the floral fête held by the Society in August last, yet, unjustly, and contrary to the rules of the Association, the defenders would not receive them. If the Court has jurisdiction at all in such a question, it is extremely limited. It will not review the proceedings of the committee, and their decisions will, in general, be final, as the parties to whom the Society has entrusted the management of its affairs. I doubt even whether it will correct an apparent mistake in the construction of the rules when there has been entire *bona fides*. But it will correct any unfairness resulting either from a violation of the rules, or an undue straining of them for the attainment *malâ fide* of some collateral object. The contention that the pursuers had ceased to be members by resigning does not seem to be well founded. It is not consistent with the correspondence, and was not strongly pressed, the defenders mainly relying on the rule which requires all subscriptions to be paid on or before August 1, which admittedly the pursuers did not do. I think the defenders were entitled to refuse to allow them to exhibit until their subscriptions were paid, but their refusal of them when tendered on August 4 was hardly fair. It is proved by the collector's book that this was a departure from the Society's own practice. In previous years they had received them from the pursuers so late as August 10; in the year in question they had taken the subscriptions of other members which were paid much later in date, and properly, for another rule declares that a member failing to pay his subscription shall retain his place on the roll until he has been two years in arrear. I cannot account for the action of the Society, except on the theory that they had made up their minds that the pursuers should not be allowed to exhibit, rule or no rule to the contrary, which is precisely one of the cases in which a court of law, if it otherwise has jurisdiction, is entitled to interfere. The important and really difficult question in the case is, whether the circumstances are such as to give the court jurisdiction. The subject is discussed in the well-known judgments—one by Lord Deas in the Cardross case, and the other by the late Sir George Jessel; and the principle on which a court acts in disputes between a member of a voluntary association and his fellow members was then stated by Lord Cranworth. Save for the due disposal and administration of property, there is no authority in the Courts of either England or Scotland to take cognisance of the rules of a voluntary society entered into merely for the regulation of its own affairs. The society is not a partnership—and where there are no patrimonial interests the expulsion of a member, however unjust, from the society—no matter what its object—a prayer meeting, a whist club, an association for some social, scientific, or political purpose—does not *per se* entitle him to legal redress. In this case I have come to the conclusion that there was a certain patrimonial interest of which, by the action of the committee, the pursuers have been wrongfully deprived. How far the mere chance of gaining a prize would be sufficient may be open to doubt. My impression is that the opportunity of competing for a prize is always of some value capable of estimation in money. But, apart from this, their exclusion from the exhibition—in which they were to appear, not as amateurs, but as professional florists—anxious for the sake of their business to have their Roses and Dahlias shown alongside those of other growers, might evidently be injurious to their trade. It would have been a good advertisement, whether they succeeded in gaining a prize or not, and if they did succeed, so much the better For these reasons I am unable to affirm the judgment of the Sheriff-substitute dismissing the action; and although it is too late to pronounce an operative decree, I think the action was properly brought, and the defenders must be found liable in expenses."

Societies.

ROYAL HORTICULTURAL.

Scientific Committee.

March 28.—Present: Dr. Müller (in the chair), Mr. McLachlan, Rev. W. Wilks, Mr. Wilson, Dr. Scott, and Rev. G. Henslow, Hon. Sec.

The Antiquity of the Citron in Egypt.—A communication was received from Dr. Bonavia, in which he referred to M. V. Loret's paper on this subject entitled, *Le Cedratier dans l'Antiquité* (Paris, 1891). That author mentions several writers from 2 B.C. to 360 A.D., and states that it was cultivated in the fourth century A.D. in Upper Egypt (Coptic, "Ghitré"); while a Citron is said to have been found in a tomb of the twelfth century B.C. It is also figured on the temple of Thothmes III., at Karnak, fifteenth century B.C. From a drawing, it would seem that even the "fingered Citron" might have been known. Dr. Bonavia discusses the probable source of the Citron in Egypt as being brought by traders through the Persian Gulf and Red Sea, for he thinks that all varieties originated in South China and spread westwards. The value of the Citron was supposed to be purely medicinal by the ancients, and M. Loret alludes to one use, namely, for affections of the spleen, the true value of which Dr. Bonavia corroborates.

Peridermium Strobi.—Mr. Plowright sent specimens of this fungus, with the following observations: "Last July I found in the garden of Mr. C. E. Boyes, at Oakwood House, Tottenhill, that the Currant bushes were affected with Cronartium ribicola, specimens of which were sent to the Scientific Committee, as this fungus had not previously been recorded in Great Britain. In the same garden were some young trees of Pinus Strobus, which were roughly trimmed so as to form a screen or hedge. On these trees must have occurred the æcidiospores of the Cronartium at some season of the year, Prof. Klebahn, of Bremen, having shown that these form the life-cycle of this fungus. On March 19 of this year I visited Oakwood House, and was pleased to find the Peridermium in perfection. It will be noticed on the specimens sent that the mycelium of Peridermium is perennial, causing a certain amount of hypertrophy in the affected branches, forming generally a fusiform enlargement of the twig. The peripheral extremity of the branch suffers somewhat at first, and eventually dies. The mycelium of the Cronartium is annual. With the heteræcious Uredineæ sometimes the æcidiospores have permanent mycelia as is the case here, at other times the mycelium of the teleutospores is thus endowed as with the gymnosporangia" (figured in *Gardeners' Chronicle*, 1892, ii., p. 134).

Ustilago on Psamma arenaria.—"The so-called U. hypodites which occurs on this grass is doubtless a distinct species. It is not common in Great Britain, and appears only to have been found upon the east coast. The specimens sent herewith are interesting as having been produced by a root which was transplanted from the sea coast three years ago into a town garden, and which still produces diseased stems. One of the specimens shows a curious distortion, consisting of a twisting of the stem within the sheath. This may be due to the fungus, although in the majority of cases this condition does not occur."

Polyanthus Blue Primrose.—Mr. Wilson exhibited a seedling from Oakwood Blue Primrose, with a very large flower, a Marianne North (pale blue), and a plum-blue Polyanthus, it being the first occasion of this strain assuming the umbellate form.

Cucumber Roots Diseased.—Mr. Hurnard, of Hingham, sent a specimen, which appeared to be attacked by the common "eel-worm." It was referred to Mr. McLachlan for further examination.

Fasciated Cotoneaster.—A specimen of this common malformation was sent by Mrs. A. Stuart, of Edinburgh. Mr. Henslow had observed a bush in a garden at Penmaenmaur, on which nearly every branch was fasciated.

Tuberculated Stem of Ailanthus glandulosus.—Mr. Wilson brought a specimen having a tuberculated structure, 6 inches broad and 3 inches deep, issuing from around the junction of stem and root. The knob-like tubercles consisted of "embryo buds" agglomerated together. What the original cause might have been which produced the hypertrophied condition, with arrest of axial growth of the buds, it was impossible to say.

Dimorphic Aralias.—Mr. Tidmarsh, Curator of the Botanic Gardens, Grahams town, sent some foliage of two species of Aralia, which, he observes, would certainly be regarded as four species had he not known the plants from cuttings upwards. The leaves of A. Veitchii, when growing in a poor soil, are about 4 inches long, and one-fifth of an inch wide. Those sent were grown in a poor soil under glass. The leaves of the same species planted out in a mass of fresh compost in a hothouse, with a moist atmosphere, and at a temperature of 60° to 90° F., were 5 inches long and 1¾ broad. Hence, while the former are linear, the latter are broadly lanceolate and tapering at the base. He also sent leaves of A. reticulata, which were upwards of 2 feet in length and 6 inches in breadth. The plant was 10 feet high, planted in the open on the banks of a stream, but too far above the water to be benefited much by it. It was under Willows, which to some extent protected the foliage from the frost of several degrees experienced at Grahamstown. Mr. Tidmarsh added, that he had no inside plants of this last species with the narrow-leaved foliage. He remarks, "We can propagate from cuttings of the narrow-leaved form, but fail to do so with the large-leaved form. This plant behaves in a similar manner to Araucaria excelsa, the young growth of which, while still possessing the narrow Juniper-like leaf, will strike from cuttings, but we cannot succeed with small side-shoots from an old trunk, these latter shoots being furnished with a thick bark and stout foliage of the mature tree." Mr. Tidmarsh raises the question whether the larger leaves of these Aralias may not be the naturally mature form, and the smaller foliage characteristic of the young stage, as with the Eucalyptus. An examination of the epidermis of the leaves sent shows that the number of cells in the same area of the broad-leaved form is to that of the narrow leaved as fifty-five to thirty-eight (upper), and as forty-four to thirty-six (lower), so that this element does not support Mr. Tidmarsh's view, inasmuch as the cells, being smaller on the larger leaf, would *per se* suggest its being the younger.

ROYAL CALEDONIAN HORTICULTURAL.

April 5.—The exhibition was one of the best ever held in Edinburgh as a spring show. Though there was an absence of extra large plants, those tabled were, in a cultural sense, of much excellence.

Tables.

Tables of plants for exhibition only were well represented by nurserymen, but there was no competition among the commercial exhibitors. At the west end of the market hall the usual semi-circle of coniferous plants made a pleasing contrast to the tables of brilliant foliage and flowers in close proximity to them. To Messrs. Dickson & Sons and Messrs. Laird belonged the handsome specimens. Thuja occidentalis lutea, Thujopsis dolabrata, Retinospora pisifera aurea were conspicuous in Messrs. Dicksons' collection; and in Messrs. Lairds' there were fine healthy specimens of Juniperus sinensis var., J. virginiana glauca, Biota orientalis elegantissima, Retinospora squarrosa, and R. pisifera aurea.

Tables of plants running the whole length of the hall were unusually gay with flowering plants. Messrs. Methven's was somewhat original, and arranged with much taste. Clematis, in natural form, towered above other species, and were very effective. Lucy Lemoine, Maiden's Blush, Miss Bateman, and others were very attractive; Acers in variety were effective, and tall plants of A. Negundo standing prominently along the centre gave majestic character to this table. Ericas, Palms, Azaleas, in variety, mixed with other spring flowers, made a very handsome display.

Mr. D. Thomson exhibited an extensive collection of Azalea mollis, Palms, Araucaria excelsa, Ferns, &c.

Messrs. Dickson & Co. had a large table of Palms, Cytisus, Azaleas, Cinerarias, Spiræas, and other showy species.

A most attractive table of Cliveias, mostly seedlings, raised at Pinkhill Nursery, was exhibited by Messrs. Laird. C. Lindenii, Madame Van Houtte, and others were shown among the seedlings, to exhibit difference of habit.

Messrs. Cunningham & Fraser had a neat and well-arranged table, in which were remarkably well-flowered plants of Rhododendron Cunninghamii. Forced Magnolias in variety were effective as dot plants. Ferns and other foliage plants were interspersed in the gay collection.

In the gardener's collection for competition, there were many choice gems from stove and Orchid-houses. Mr. McIntyre, Glen, was 1st with a choice selection, which was rich with Dendrobiums (Wardianum especially), Odontoglossum triumphans, and O. Andersonianum, Crotons, Amaryllis, Lilium Harrisii, Azaleas, Cyclamens, and choice foliage plants. The 2nd prize went to Mr. A. Crichton, gardener, Liberton, for Dracænas, Cyclamens, Azaleas, Ferns, &c.; this lot was very well arranged, being light, and showing the individuality of the plants.

For ten forced plants, Mr. McIntyre was 1st; Rhododendrons, Deutzias, and Lilium Harrisii were finely-grown and well-flowered.

Stove and Greenhouse Plants.—For six stove or greenhouse plants in flower, Mr. McIntyre again had the highest honours. Anthurium Scherzerianum Wardii was remarkably well-flowered; an immense specimen of Cœlogyne cristata covered with flowers, and Dendrobium Wardianum were well done. The 2nd and 3rd exhibits in this class were also well shown. For four stove or greenhouse plants, Mr. Bennet was 1st; a grand Cliveia was his finest specimen.

Greenhouse and hardy Rhododendrons were numerous, but none of extra merit.

For four Azalea indica, the 1st prize was awarded to Mr. Bald. The best two were shown by Mr. Murray, Restalrig Gardens.

For six Azalea mollis, Mr. McIntyre showed a fine lot, very well-flowered.

Foliage plants were excellent as regards quality, but not so numerous as usual. Crotons, Cycads, Yuccas aloifolia and variegata, were in good numbers, and well-grown. Gleichenias were not of such gigantic dimensions as are often seen at Edinburgh, but they were numerous; Mr. Laing had the finest exhibit. Long tables of Cinerarias were remarkable for their large flowers. Dielytra spectabilis filled a long table, the plants were all large and finely flowered, so were Spiræas, Mr. Aldjo was 1st for six of extra merit. A long table of finely grown Pelargoniums, mostly double and semi-double, made a fine exhibit of well-flowered plants.

Orchids.

Orchids were unusually well represented, several fine tables of good, well flowered plants, were very attractive. Mr. McIntyre was strong in this class. His Cymbidium eburneum, Cœlogynes, Vanda suavis, Dendrobiums, and Cypripediums were well done—Cymbidium Lowianum was of large size and well-flowered. Mr. Sharp, Forgandenny, was 2nd. His Odontoglossum Alexandræ, Dendrobium Wardianum, and Cattleya Lawrenciana, were finely flowered. Mr. Grassant, Dundee, was a close 3rd; Cattleya Mendelii and C. Schroderæ were of much excellence. Single specimens were large and well-flowered, especially Dendrobiums thyrsiflorum and Wardianum.

The table of Orchids from Messrs. F. Sander & Co., St. Albans, was crowded with visitors throughout the day. Fine specimen Dendrobium Dalhousieianum were majestic and attractive by their large dimensions; Cattleya Mendelii, Cymbidium Lowianum, Odontoglossum cirrhosum, Angræcum Leonis, Ada aurantiaca, Dendrobium Jamesianum, Odontoglossum Alexandræ, Cattleya Lawrenceana, Oncidiums, Lycastes, and others placed irregularly as to height, gave a natural and uncommon appearance to this handsome exhibit.

For a single Orchid, a large specimen of Dendrobium thyrsiflorum came from Mr. Chapple, Rangewood Gardens; the plant was covered with racemes of flowers.

Oncidiums and Cypripediums, as single specimens, were in fine form, in the classes for single plants.

In the classes for cut Orchids there were some wonderfully fine exhibits, Mr. McIntyre coming well to the front with fine Dendrobiums, Vandas, and Odontoglossums.

Messrs. Ryder & Sons had a table of beautifully-flowered Japanese Primulas.

Cyclamens had a large table set apart for them, and it was overcrowded. Mr. Lunt's six, from Keir Gardens, were of the highest merit; and all the other exhibits in this class were examples of skilful management.

Amaryllis, &c.—For the best four Amaryllis there was keen competition, and some remarkable flowers, grown in pots.

Passing over large exhibits of fine Mignonette, Polyanthus, Primulas, Auriculas, Alpine plants, &c., we come to the Hyacinths, which always bring keen competition at Edinburgh. Mr. Millar was 1st, with well-grown examples; among his best were Queen of Blues, La Grandesse, Mr. Plimsoll, Lord Derby, and Princess Amalia. Mr. McBean, Craigend, was 2nd, with a fine collection; his Koh-i-noor was said to be the best Hyacinth in the show. Queen of Blues, Ida, and Marie, were also very fine in form, and large in size.

For eight, Mr. Carnegie was 1st, his Charles Dickens being the best flower in his exhibit. The best six went to an amateur, Mr. Meiklin, Sunnybank.

Tulips were a great show in pans and pots. Mr. Pearson, gr., Beechwood, had the finest flowers. Keiser Kroon, extra fine; Joost Van Vondel, showy and good.

The cut Roses were well represented, much better than those in pots. Sénateur Vaise, La France, Niphetos, Souvenir d'Ami, were fine in form, and fresh.

Mr. Parlane had splendid Maréchal Niels, and Mr. Bryson, nurseryman, Helensburgh, had 1st for twelve of that variety, and were of great excellence.

Camellia blooms were generally small, but clean and neat.

Fruit

was not strongly represented. 1st for finely-coloured bunches of Lady Downes' Seedling Grapes went to Mr. Smith, Oxenford; Mr. Kidd, Carbery Towers, was awarded 2nd for the same variety.

Strawberries from Mr. Smith were of extra merit, being large and richly coloured. Vicomtesse de Thury was the variety, and for its size was scarcely recognisable; Mr. Murray, Parkhall, was 2nd with a fine dish of noble Apples, which were well kept, but not of special merit.

Vegetables were numerous, mostly of large Rhubarb, huge Leeks, and quantities of roots, as esculents grown in the open. Potatos were well shown, sound and handsome. Beauty of Bute, Abundance, Scotch Blue, and Windsor Castle were among the finest in appearance.

Only one collection of forced vegetables was exhibited, which came from Mr. Johnstone; young Potatos, fine Onions, Tomatos, and French Beans were among his best exhibits. Collections of salads were plentiful, but poor in quality. Extra fine Seakale came from Mr. Price, Sunderland Hall. French Beans were in quantity, and mostly fresh and well-grown.

MARKETS.

COVENT GARDEN, April 6.

Market still heavily supplied, with business quiet. *James Webber, Wholesale Apple Market.*

ORCHID-BLOOM in variety not in quantity.

THE WEATHER.

[BY the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees — a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.: 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

THE following summary record of the weather for the week ending April 1, is furnished from the Meteorological Office:—

"The *weather* continued extremely dry, fine, and bright over the greater part of the kingdom until towards the end of the period, when the sky became less clear generally, and slight rain fell over many of the northern and western parts of the kingdom.

"The *temperature* was again very high during the daytime, and low at night, the average values for the week ranged from 3° above the mean in 'Scotland, E. and England, E.,' to 4° in most other districts, to 5° in 'England, N.W. and S.W.,' and to 6° in the 'Channel Islands.' The highest of the maxima were registered on April 1 at most of the English stations, and on earlier dates in Ireland and Scotland; they ranged from 63° to 64° in Scotland, from 65° to 66° in Ireland, and from 65° to 71° over England. The lowest of the minima were recorded, as a rule, on March 29, when they varied from 21° in the 'Midland Counties' (at Stamford), and from between 23° and 28° in most of the other districts, to 31° in 'England, N.W.,' 33° in 'Ireland, N.,' and 39° in the 'Channel Islands.' The diurnal range of temperature during the middle part of the week was again unusually large, amounting over some of the inland parts of England to more than 40°.

"The *rainfall* was again altogether absent from the east and south of England, and was very slight elsewhere; over the central and northern parts of England the fall was less than five-hundredths of an inch, but in the western parts of the kingdom there were one or two-tenths, and in 'Scotland, N.,' three-tenths of an inch measured.

"The *bright sunshine* was again very prevalent, although it showed a considerable decrease on that recorded during the preceding week. The percentage of the possible duration ranged from 29 to 37 in Ireland, from 35 to 40 in Scotland, and from 42 to 76 in England. In the Channel Islands the percentage was as high as 85."

NOTICES TO CORRESPONDENTS.

BOOKS: *T. A. Handbook of the British Flora.* By G. Bentham and Sir J. D. Hooker. *Illustrations of the British Flora.* By W. H. Fitch and W. G. Smith. (London: L. Reeve & Co., 5, Henrietta Street, Covent Garden.) These two books may be bought for a less sum than that you mention.

BORDEAUX MIXTURE: *F. R. H. S.* Sulphate of copper in crystal, 6 lb.; unslacked lime, 4 lb.; water, 40 gals. If slaked lime be used, a larger quantity must be used. For small quantities, the following may be adopted:—Copper-sulphate, 4 ounces; lime unslacked, 4 ounces; water, 8 gals.

BORONIA MEGASTIGMA AND DAPHNE INDICA RUBRA: *Subscriber.* The first-named should be potted at this season, if the plant has been received from the nursery in the pot in which it has been wintered, employing the best kind of peat in a moderately fine state and a considerable addition of fine silver sand. The roots for about ¼ inch in depth all round the old ball should be carefully loosened with a pointed bit of wood, and the crocks removed if not firmly embedded. The new pot should be an inch wider than the reduced ball; and it must be drained with from 1 to 2 inches of clean moderately-fine broken crocks, taking care to put a good large concave bit over the hole, and over that the larger pieces, finishing off with the finest. Put some fibry bit of peat over this, and sufficient soil to raise the plant within an inch of the pot-rim; fill in round the ball gradually, and make it very firm with the fingers, finishing off level, or if there is any difference let the crown of the root be slightly raised. Do not pot a dry ball, and if the soil used is moist, do not afford water before the second day, but sprinkle overhead in the morning and again at 4 P.M. Place in a slightly-aired frame or pit, or the warmest part of the greenhouse till root-action begins. Shade from bright sunshine. A good temperature after potting is that between a stove and greenhouse, but more air may be given as the season proceeds. Grow in a frame during the summer. Plants may be stopped all over till the middle of June, not later; and they may have repottings up to the end of that month. Keep in an airy greenhouse from end of September till growth begins. Keep it during that time moderately dry, giving plenty of water when water is needed, never driblets. Very little shade is ever needed except for a short time after repotting. Daphne indica will succeed under much the same kind of treatment, but a small quantity of rich loam and rather less sand should be used with the soil. The plant is not amenable to much stopping of the shoots, one stopping will be enough in one season. Early spring potting is desirable, and no second potting is needed, which means that too abundant pot-room is not favourable to good flowering. The plant flowers naturally in our winter.

KOHL RABI: *A. K.* This is generally considered to be a seedling variety of the common Cabbage, Brassica oleracea. We do not think it is a hybrid between the Cabbage and the Turnip. Kohl Rabi is grown from seed.

NAMES OF FRUITS: *Thos. Denny. Apple:* Mère de Ménage.—*H. W. Perrin.* 1, Blenheim Orange; 2, Tom Putt; 3, Old Pomeroy.—*B. Z.* Not known, probably some purely local varieties.—*P. Macowan.* The fruit grown at the Cape looks like Cellini, but Apples are so altered when grown in other countries. It is soft, and wanting in flavour.

HOLLY FLY: *R. T.* Your Hollies are attacked

FIG. 63.—PHYTOMYZA ILICIS.

with the Holly-fly (Phytomyza ilicis). Sweep up and burn the leaves.

NAMES OF PLANTS: *T. H. Moffat, N.B.* The Peziza is Sarcoscypha coccinea.—*G. C.* Streptosolen Jamesoni.—*H. M., Sligo.* 1, Vanda Parishii Marriottiana; 2, Aërides japonicum.—*W. H. D.* Crinum Moorei. *G. O. M.* 1 and 2, Oncidium ampliatum; 3, O. papilio; 4, Rodriguezia secunda: 5, Begonia manicata; 6, Santolina incana.—*R. C. T.* Dendrobium aggregatum majus.—*J. Trevena.* 1 and 2, varieties of Cordyline australis; 3, Dracæna rubra; 4, D. congesta; 5, D. marginata.—*F. E., Christchurch.* The Cattleya and Dendrobium Dalhousieianum are only ordinary forms. The Lycaste Skinneri is distinct and nearest to L. s. alba.—*J. R. H.* The green one is Helleborus fœtidus; the other next week, enclosure not received.—*R. E. M.* 1, Bignonia grandiflora; 2, Trachelospermum jasminoides; 3, Gaultheria Shallon.—*J. K.* Helleborus fœtidus.

REGISTRY: *A Reader.* The proceeding strikes us as very unusual. We are in communication with the manager. In the meantime, we advise you not to comply with the request.

STRAWBERRY: *Beta.* It appears to be the variety known as President, but we cannot be sure from such scanty materials as were sent.

TREE CARNATIONS: *Dianthus.* Pride of Penshurst, Germania, yellow; Crimson King, Col. Cox, scarlet; Alegatière, rich red; King of Scarlets; La Belle, white; L'Hermine, white; Miss Jolliffe, soft pink; Mdlle. Carl, white; White Swan, white; Winter Cheer, scarlet shaded crimson; Zouave, red; Souvenir de la Malmaison, varieties; T. W. Girdlestone, rich buff ground edged and flaked vermilion; Lucifer, scarlet; Saccharissa, primrose, striped, and edged with pink.

VINES: *B. B.* Petroleum is always a dangerous substance in unpracticed hands. It must have been used either alone or mixed with something in too great a proportion. If two wineglassfuls of the oil be well mixed with water, soap, clay, and cow-dung, it becomes so finely divided amongst the mass of other materials, that it is rare that its use causes injury to Vines. When used with hot-water alone, and it is not constantly stirred while it is being used, the oil floats on the water, and then it is sure to do harm. You can do nothing—there is no antidote—the Vines may die, as the dressing was put on whilst growth was dormant. Sometimes recovery follows its use when the sap has begun to move.

WRIGHT & CO.'S GAS BOILERS. *W. H. B.* Enquire of the publisher of the work you named in your note—Upcott Gill, 170, Strand, London, W.C.

THE IMPROVED GARDEN CULLY

(VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

6-in., 1*s.* 6*d.*; 8-in., 2*s.*; 10-in., 3*s.*; 12-in., 6*s.* 6*d.* 15-in., 8*s.*

(The larger sizes are very strong for carriage drives.)

WANTED, a MAN, with a knowledge of Propagating and Growing for Small Nurseries, mostly under Glass.—Apply, JOHN E. KNIGHT, Nurseryman, Wolverhampton.

WANTED, a respectable young MAN; one accustomed to Ferns preferred. Wages, 20s. per week.—E. CURRY, West Green Nursery, Tottenham.

WANTED, a young MAN for Potting, Watering, and Tying. Must be well up in Growing Ferns.—T. BALDWIN AND SON, Edith Nurseries, Burchall Road, Leyton.

WANTED, an ASSISTANT, as SOFT-WOOD PROPAGATOR.—Age about 20; permanent and progressive situation.—State age, wages and references, W. TROUGHTON, Nurseryman, Preston.

WANTED, a smart YOUTH as IMPROVER in the Nursery. Must be quick at Potting.—Apply, stating all particulars, to JAMES GOLD, Southfields Nursery, Wandsworth, S.W.

REQUIRED IMMEDIATELY, a young MAN, as SHOPMAN; General Knowledge of Florist and Seed Business. Small security necessary.—State age, experience, salary, &c., to ROBT. WILLIAMS, The Nurseries, Cholsey, Berks.

WANT PLACES.

TO GARDENERS AND OTHERS SEEKING SITUATIONS.

The pressure upon our space at this season of the year is so great, we are compelled to state that advertisements received after 6 P.M. *on Wednesday will, in all probability, be held over to the next week.*

F. SANDER AND CO. can recommend several highly qualified and energetic HEAD and UNDER GARDENERS, of excellent character, and proved ability; men thoroughly fitted for all the various duties of their profession. For all particulars, please apply to—

F. SANDER AND CO., St. Albans.

THOMAS BUTCHER can recommend several HEAD and UNDER GARDENERS of first-rate character and proved ability. Gentlemen seeking such may have particulars free.—Apply to THOMAS BUTCHER, Seed Merchant and Nurseryman, Croydon.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the *highest* respectability, and *thoroughly practical* at their business. All particulars on application.

Telegraphic and Postal Address—"DICKSONS, CHESTER."

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

GARDENER (HEAD); age 30.—J. DUMBLE, Gardener to Sir Charles Philipps, Bart., Picton Castle, Haverfordwest, is desirous of recommending his General Foreman, H. Butcher, to any Lady or Gentleman requiring a thoroughly competent man. He has a good knowledge of the different branches of Gardening, is well acquainted with the Cultivation of Fruit (Indoor and Out), Flowers and Vegetables, is also a most successful Grower of Chrysanthemums for Exhibition.

GARDENER (HEAD).—G. E. MARTIN, Esq., Ham Court, Upton-on-Severn, wishes to recommend a young Man as above. Thoroughly experienced in all branches of Gardening (Orchids included). Unexceptional references from last and previous employers.—Mr. BATTEN, Head Gardener.

GARDENER (HEAD); age 36, married, one child.—A GENTLEMAN can with every confidence recommend his Gardener, who has been with him upwards of six years. Thoroughly experienced in all branches. First-class references from good establishments. Successful Fruit Grower. Can Manage Stock if required.—J. VOSS, Finches, Lindfield, Sussex.

GARDENER (HEAD).—Age 30. WM. HOVELL, Gardener to G. H. Morrell, Esq., Headington Hill Hall, will be pleased to recommend his General Foreman, THOS. PORTER, to any Lady or Gentleman requiring the services of a good all-round hand. W. H. will be pleased to answer any questions.

GARDENER (HEAD), Scotch.—Age 31, married; well recommended. Seventeen years' practical experience in good establishments; left through a death.—J. M. R., Messrs. Dicksons, Chester.

GARDENER (HEAD), where two are kept.—Age 26, single; twelve years' good experience, Inside and Out. Three and a half years' good character from last situation.—F. B., Orleans House, Twickenham, S.W.

GARDENER (HEAD).—J. MAYNE, Bicton Gardens, Budleigh Salterton, recommends a man as above; thoroughly acquainted with all matters relative to Horticulture. Testimonials of the highest order.

GARDENER (HEAD WORKING), or GARDENER and BAILIFF.—A GENTLEMAN can highly recommend his Gardener as above. Thoroughly experienced in all branches, Indoors and Out, Fruit, Flowers, Vegetables, and Kitchen Garden. Land and Stock. Good judge, buyer, and seller. Wife can manage dairy, poultry; or Caretaker if required. Fifteen years' reference, no incumbrance.—F. D., 48, Disraeli Road, Putney, S.W.

GARDENER (HEAD WORKING), where two or three others are kept.—Age 26; thirteen years' good practical experience Inside and Out. Excellent character and references.—Mrs. LLOYD, Caythorpe Hall, Grantham.

GARDENER (HEAD WORKING).—Age 34, married; twenty years' experience in all branches. Good Chrysanthemum Grower. Good reference.—ALFRED FRY, Gardener, Brooklands, Broughton, Preston, Lancashire.

GARDENER (HEAD WORKING).—Age 37, married; thorough practical all-round man. Ten and a half years' good character from last place, six from previous.—H., 48, Bedford Road, Ealing Dean, W.

GARDENER (HEAD WORKING), where three or four are kept.—Age 42, married; life experience in all branches. Left through a death. Good references.—P. J., 99, Hamilton Road, Norwood, S.E.

GARDENER (HEAD WORKING).—Age 34, married; thoroughly experienced in all branches of Gardening. Leaving through establishment breaking up. Good character.—F. FITZWATER, Gardens, Hillfield, Ashtead, Surrey.

GARDENER (HEAD WORKING).—Married; thoroughly experienced.—A GENTLEMAN highly recommends the above, who has been in his service over fourteen years.—B., Tollerton Hall, Notts.

GARDENER (HEAD WORKING).—Married no family; good practical experience in all branches. Good recommendations.—L. N., 3, Pownall Road, Fulham, S.W.

GARDENER (HEAD WORKING); age 40, married.—FRANK SOMERFORD, who has been twelve years Head Gardener at Crisworth Park, Doncaster, and has left through the death of his employer, will be glad of a re-engagement where the services of a good practical Gardener are required.—44, Catherine Street, Doncaster.

TO FLORISTS, &c.—A young Man seeks re-engagement. Quick at Wreaths, Bouquets, Decorations, &c. Nine years' experience, and first-class references.—W. PINK, 53, St. George's Road, Brighton.

HOLLOWAY'S PILLS.—Weary of Life.—Derangement of the liver is one of the most efficient causes of dangerous diseases, and the most prolific of those melancholy forebodings which are worse than death itself. A few doses of these noted Pills act magically in dispelling low spirits, and repelling the covert attacks made on the nerves by excessive heat, impure atmospheres, over indulgence, or exhausting excitement. The most shattered constitution may derive benefit from Holloway's Pills, which will regulate disordered action, brace the nerves, increase the energy of the intellectual faculties, and revive the failing memory. By attentively studying the instructions for taking these Pills, and obediently putting them in practice, the most despondent will soon feel confident of a perfect recovery

BEGONIAS.—Ours are now lovely, and showing more and more every day surprisingly beautiful flowers, and new colours of exquisite tints. Our Seedlings never were so good and robust: we should feel a real pleasure in showing them to friends and coming customers, and also around our establishment, which is now highly interesting. Our Illustrated Catalogue is acknowledged the best Year-Book for the Garden ever issued, and we should like to send it to all who are desirous of having really good Gardens. The best Plants and Seeds, which we send safely to all parts of the world. H. CANNELL AND SONS, Swanley, Kent.

HIGH-CLASS BEGONIAS.—Fine strong tubers, from carefully-selected prize plants, Doubles or Singles, 21s., 10s. 6d., and 5s. per dozen. A reduction made if quantity taken.
THURGOOD AND SON, Land Agents, Saffron Walden.

THE NEW FLOWER from SOUTH AFRICA.

NEMESIA STRUMOSA SUTTONI.—Mr. W. H. GOOD, The Gardens, Wonham Manor, Betchworth, says:—"The Nemesia Seed has come well—fully 60 per cent. It was sown on March 13, shaded for a few days, then exposed to the sun. I saw to-day (April 3) several more plants coming up. We lost three plants after being watered; it is now kept dryer."
Price of Seed, 2s. 6d. per packet, post-free. The seed germinates best when sown during the month of May. Nemesia strumosa Suttoni can only be obtained direct from—

SUTTON AND SONS, THE QUEEN'S SEEDSMEN, READING.

New Roses.—Princess May and Corinna.
WM. PAUL AND SON are now Booking Orders for the above. Plants, 10s. 6d. each, are expected to be ready at the end of May. Orders will be executed in rotation as received.

AUTOMATIC DAMPER
FOR GREENHOUSES.

Dr. GEORGE WALKER, Inventor of Chrysanthemum Cup Tubes, Wimbledon, says:—"I have used your Automatic Damper for some weeks, and am perfectly satisfied with it. A most ingenious and useful invention."
Mr. H. J. JONES, Hither Green, Lewisham, who uses the Damper in a house 100 feet long, says:—"I find this damper is in every way economical. It saves both fuel and labour, and keeps the house at a more even and better temperature."

HEATING OF

ALL KINDS.

Testimonials.

"Shirburn Castle, January 5, 1890.

"SIR.—As you requested my opinion of the houses which you erected for me some 4 years ago, I beg to inform you that I consider them a perfect success, and I have recommended them to many of my neighbours.—Yours truly (signed) MACCLESFIELD."

"Hornby Castle, Lancaster, February, 1890.

"Major FOSTER has much pleasure in stating that the vineries and forcing-houses which were erected by Mr. Helliwell in 1884, continue to give perfect satisfaction, both to himself and his gardener."

"Estate Office, Ripley, Yorkshire, January 23, 1890.

"Sir HENRY INGILBY has much pleasure in stating that the glazing work executed by you, under your patented system, at the Ripley Castle Gardens, has been in every respect entirely satisfactory. The work has stood its 8 years' wear and tear extremely well, and has hitherto cost nothing to keep it in repair."

HELLIWELL & CO., 9, Victoria St., Westminster, S.W.

Drill leaves same day, Invaluable for filling up blank places left by Horse Drill. Beware of imitations.

THE MOST SUITABLE FOR

SHADING ORCHIDS, FERNS,

Palms, and Stove and

GREENHOUSE PLANTS.

WILLIAMS' HOTHOUSE SHADING.

It is a strong, durable Cotton Netting, woven in squares so close as to exclude the direct rays of the sun, but admitting the greatest amount of light attainable through shading.

It withstands the weather better than any other class of Shading, and may be beneficially used on account of the thickness of its texture, during cold weather, to keep the frost out. The leading Orchid and Plant Growers in the country have used this material for some years, and speak very highly of it, pronouncing it to be the very best material for Plants they have ever used.

Blinds made up and fixed complete.

Sold in pieces, 30 yards long by 1½ yard wide. Price 40*s.* each. Samples submitted gratis.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. **Price, 2s. post-free.**

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

Grand Plants, just showing bloom.

From 18s. to 42s. per dozen.

FRANK CANT, Champion Rose Grower,

BRAISWICK NURSERY, COLCHESTER.

ALL MUST HAVE

THE LATEST NOVELTY IN CHRYSANTHEMUMS—

"CHARLES DAVIS,"

The most magnificent Chrysanthemum in existence. Golden sport from the immensely popular Viviand Morel. Canary-yellow, most beautifully tinted rosy-bronze.

H. J. JONES has great pleasure in announcing that he has concluded the purchase from Mr. N. Davis of one-half of the entire stock, estimated at about 500 plants, which will be ready early in May. Though late in the season to introduce this novelty, it is of such a free-flowering nature that good exhibition blooms can be secured from these plants, but as some will necessarily come ready before others, early Orders will receive the best plants.

Price 6s. each; 3 for 15s.; 6 for 27s. 6d.

No further trade reduction from these prices. Orders will be executed in rotation, and in case of insufficiency of stock, Cash Orders will receive priority.

H. J. JONES,

RYECROFT NURSERY, HITHER GREEN, LEWISHAM, S.E.

Gardeners' Chronicle.

SATURDAY, APRIL 15, 1893.

GHENT.

HINTS FOR VISITORS.—The accommodation at the principal hotels has, we understand, long since been secured in advance; but those who may find a difficulty in obtaining a domicile in Ghent, will have none in finding quarters in Brussels, Bruges, or Antwerp, all within about an hour's ride of Ghent, and to all of which access by rail is easy.

For the convenience of intending visitors, we append a list of the principal nurseries in the vicinity of the city, together with indications of the distance from the centre of the town, and of the readiest means of reaching the desired spot. Among some two hundred establishments, it is obvious that we can only enumerate a few of the more prominent; but any one of them will be found instructive to the visitor.

Starting Point.—The Place d'Armes, in the centre of the town. Tramways in every direction. Cab-stand.

GHENT.

Pynaert Van Geert.—Porte de Bruxelles (the tram stops at the door). Miscellaneous collections, Azalea indica, hardy Rhododendrons and Azaleas, Palms, Cypripediums, &c.

Bernard Spae.—Coupure (facing the Exhibition Buildings). Palms and Araucarias.

Liévain Spae-Vandermeulen.—Boulevard du Jardin Zoologique (fifteen minutes walk). Palms and Cycads.

Emile De Cock.—Boulevard d'Okkerghem (fifteen minutes' walk from the Exhibition). Palms.

State School of Horticulture, Botanic Garden.—M. Rodigas.

GENDBRUGGE.

Société Louis van Houtte, père (Five minutes from the stopping-place of the tram).—Hardy Greenhouse and Stove Plants, Palms, Greenhouse, and hardy Bulbs, pot Roses, &c.

D'Haene, Chaussée de Bruxelles.—(Five minutes' walk from where the tram stops.) Ornamental plants of every kind, Azalea indica, Palms, &c.

De Smet frères, Chaussée de Bruxelles.—(Three minutes from where the tram stops.) Palms, Araucarias, &c.

Louis De Smet.—(Two minutes from the stopping-place of the tram.) Palms, Araucarias, Anthuriums, &c.

Fréd. Burvenich, pére, Dries (Gendbrugge, Nord).—Fruit trees and bushes, ornamental shrubs, &c.

Delaruse-Cardon, Chaussée de Bruxelles.—(Facing the stopping-place of the tram.) Araucarias, Gloxinias, &c.

LEDEBERG.

Alexis Dallière, Chaussée de Bruxelles.—(About five minutes from where the tram stops, opposite the Etabl. d'Haene.) Hot-house plants, Palms, Anthuriums, Cypripediums, &c.

Jules de Cock, Chaussée d'Hundelghem, auction sales. Five-and-twenty minutes in a cab. Plants of every variety.

Joseph Vervaene, Chemin de Rodes. Azalea indica.

PORTE DE COURTRAI.

Société Horticole Gantoise, Chaussée de Courtrai.—The tram stops fifteen minutes' walk from the door. Palms, &c.

*

Porte de Bruges.

Story.—(Twenty-five minutes by tram.) Palms, Araucarias, Dracænas, &c.

Porte d'Anvers (Mont St. Amand).

(Tram to the beginning of the Commune. It is better to take a cab all the way.)

Edm. Vervaet et Cie.—Orchids in great variety; Cattleyas a specialty.

François Desbois.—Soft-wooded plants and Cypripediums.

Auguste van Geert (*H. J. Kuik*, successor).—Bulbs, Palms, Azalea indica, hardy Azaleas, New Plants, &c.

Louis De Smet-Duvivier. — Greenhouse Plants, Anthuriums, Dracænas, Aroids, Orchids, &c.

Loochristy.

(The tram goes to the Pays de Waes station, thence ten minutes by rail.)

Charles Vuylsteke.—Orchids of every kind; Odontoglossums and Cypripediums a specialty; Palms, Azalea indica, Outdoor Plants, &c.

La Pinte.

(Ten or fifteen minutes by rail from Ghent, south station.)

Jules Verhoost.—Camellias, &c.

The neighbourhood of the Portes de Courtrai and de Bruges, as well as the suburbs of Loochristy, La Pinte, Meirelbeke, Wondelghem, and Everghem are important horticultural centres, well worth visiting by strangers.

THE ARRANGEMENT OF THE EXHIBITION.

We are enabled to lay before our readers the plan of the arrangement in the great hall of the Casino and of the Annexe (see figs. 68, 69, on pp. 453 and 455). In the great hall are arranged the large groups, including Palms, Cycads, &c. Above the great hall are other apartments, in which the new plants, Orchids, and miscellanea are exhibited. In the grounds are greenhouses and other miscellaneous exhibits.

During the twenty-five years that the great hall has been built, the difficulty has been at each successive quinquennial to vary the arrangement, and to contrive something new. On the occasion of the last Chrysanthemum show in November, a symmetrical arrangement of straight and regular lines was adopted. The result was excellent, and the general impression was that some similar scheme must again be adopted. M. Pynaert, the designer of the plan which has been finally selected, thought that for a great quinquennial exposition, a geometric arrangement would not produce a satisfactory result, and his opinion was based upon the following circumstances:—A formal arrangement requires to be seen as a whole; for this purpose all the tall decorative plants are placed in the background or at sides of the building to hide the walls, and at the same time to act as a frame to the masses of lower-growing flowers which occupy the centre.

In a general exhibition, where the collections of Palms, Cycads, Tree Ferns, &c., are very numerous, it is no longer possible to confine them exclusively to the background or to the sides of the building. They must, on the contrary, be made to serve as verdant masses to break up, set off, and serve as contrasts to the brilliant groups of Indian Azaleas, Anthuriums, Cliveias, &c., as well as the less highly coloured, but none the less beautiful, plants such as the Medinellas, Gardenias, Dipladenias, &c. In the plan adopted for the great hall of the Casino, the originator was influenced by the desire to take precautions against the time when crowds will flock to the exhibition. On some days the numbers admitted will reach 25,000, and this rush must be guided and regulated. For this result it is sufficient to block the secondary paths. The great stream will thus pass along the three aisles in succession, passing before all the exhibits, and forming one long train, the progress of which can only be in one direction.

The Annexe.

Here the architect has proposed to himself to make manifest the grand proportions—shall we say the boldness—of the design, of this temporary structure. This building has a nave 80 feet wide and 130 feet in length, expanding at one end between the supporting columns into a hall of 152 feet in width and a length of 130 feet. In the centre are flower beds, whilst banks for ornamental shrubs occupy the sides. A circular basin, with a fountain, occupies the middle of the hall. The groups of plants are disposed according to their height, rising gradually from front to back.

NEW PLANTS.

Among the new plants exhibited are the following:—

New Plants from Hort. Sander.

Ludovia crenifolia, Drude * (fig. 64, p. 443).—This is a noble stove plant belonging to the Cyclanths, a small order allied to Palms and to Aroids, but quite distinct from either. The plant is of large size and (at first) tufted habit, with the sheathing leaves closely set in two ranks. The blades of the leaves are about 18 inches long, dark green, leathery, somewhat plicated, obovate lanceolate, slightly crenate at the margin, gradually tapering at the base into a long amplexicaul stalk, about 8 inches long, midrib prominent on both surfaces, secondary veins rather closely set, running from the midrib upwards and a little outwards towards the apex. In its fully developed condition the plant is described as being an epiphyte, or as scrambling along the ground, emitting adventitious roots from the stem, after the fashion of some Aroids, e.g., Philodendron. From its peculiar habit and noble aspect it forms a highly ornamental stove plant where space is of secondary consideration. The plant is a native of the Amazonian provinces of Brazil. *M. T. M.*

Oreopanax Sanderianum, Hemsley (fig. 67, p. 451).—This is a very striking evergreen Araliad, with Ivy-like leaves of peculiar and very variable shape, and bears handsome panicles of very numerous whitish flowers. The shrub will make a highly ornamental decorative plant for the conservatory. It is a native of Guatemala, and was fully described in our columns (*Gardeners' Chronicle*, June 4, 1892, p. 718), by Mr. W. B. Hemsley, F.R.S. A reference to the figure, and to Mr. Hemsley's description, precludes the necessity of entering into further detail.

Strobilanthes (*Goldfussia*) *Dyerianus, Hort. Sander.*—A stove shrub of the Acanthad family, with leaves opposite, connate at the base, ovate, oblong acuminate, rosy-lilac on the upper surface, paler beneath, with prominent veins. The flowers are borne in erect, four-sided spikes, with rounded, boat-shaped bracts, and slightly irregular, funnel-shaped corollas of a violet-blue colour, each about 1 inch in length. A very beautiful foliage-plant, resembling some of the Bertolonias in the colouring of the leaf, and having an additional but subordinate attraction in its flowers. East Indies.

Dracæna Sanderiana, Hort. Sander (fig. 65, p. 445).—A very beautiful stove species, with rather slender, erect stems, covered by the sheathing bases of the leaves. The whole surface of the plant is covered with a silvery bloom. The leaves are spreading, about 7 inches long by 1½ inch broad, rather rigid, lanceolate acuminate, flat, or often twisted, disc green, with alternating bands of silvery-white of various widths. This is one of the most attractive coloured foliage plants that we know of, and from its moderate size and freedom of growth, it is likely to be a great favourite. It is a native of West Africa. *M. T. M.*

Vriesea tesselata, var. Sanderæ, Hort. Sander.—A beautifully-marked Bromeliad, with tufts of oblong acute leaves, with longitudinal bands of white, ivory, and yellow, on a tesselated green ground, the tesselations pale green in the centre, limited by dark outlines. Native of South Brazil.

Salmia Laucheana, Hort. Sander.—A Cyclanth of the genus Carludovica, and allied to C. plicata. The leaves are tufted, two-ranked, coriaceous plicated, dark green, obovate oblong, deeply dividing at the apex into two pointed lobes, tapering gradually at the base into a long sheathing stalk. The plant is a native of Antioquia. [A figure of this will probably be given in our next issue.]

* *Ludovia crenifolia*, Drude in *Martius' Flora Brasiliensis*, vol. iii., part 2, p. 213, t. 60, f. 1 (1881).

Alocasia Watsoniana, Hort. Sander.—This is a handsome stove Aroid from Sumatra, closely allied to A. Putzeysii. The leaf-stalks are about 2 feet in length, pinkish, cylindrical at the base, gradually tapering upwards, and curved at the apex, so as to bring the base of the peltate leaf upwards, and its upper surface to the front. The blades are about 1 foot 9 inches long by 1 inch in greatest cross measurement, somewhat thick in substance, peltate, sagittate at the base, oblong-ovate, acuminate, wavy at the margin. Midrib and principal veins prominent, like the margin white, front surface rich olive-green, bullate; back rich wine-purple, with large circular yellow translucent spots at the junction of the veins with the midrib. *M. T. M.*

(*To be continued.*)

NEW OR NOTEWORTHY PLANTS.

BLETIA GODSEFFIANA, *n. sp., Kränzlin.**

The plant is quite in the way of all the old West Indian Bletias known from the earliest times of Orchid cultivation. The flowers are in shape and general appearance very near to those of Bletia florida, R. Br.; B. gracilis, Lind.; and smaller than in B. verecunda, R. Br., to which it has great resemblance. The side-lobes of the lip have straight and by no means waved borders; this character is only developed in the middle lobe; the dimensions of the flower are much smaller, and the colour is quite different. If we judged only by descriptions, we might presume it to be Bletia Shepherdi, Hook., described and figured in the *Botanical Magazine*, pl. 3319 (united by Reichenbach with B. verecunda), but the abundant material at hand in a living state proves it at once new and distinct. The flowers of B. Godseffiana are smaller, and dark green outside; the leaves narrower, and not half as broad as in B. verecunda and B. Shepherdi. The plant has been imported by Messrs. F. Sander & Co., and is dedicated to Mr. J. Godseff, the manager. *Dr. F. Kränzlin.*

Odontoglossum Kranzlinii, *n. sp.*†

This pretty new species of Odontoglossum has much the same form and manner of marking in the flowers as O. elegans; the form of the labellum and its crest partake somewhat of the arrangement of the same organ as in O. nævium, while the downy, or velvety, reddish-brown blotch in the middle of the labellum is suggestive of O. Schillerianum. Nevertheless, there is nothing about the plant to lead to the supposition that it is a natural hybrid or any other than a good species; at all events, as well worthy of the rank as the majority of those to which it is accorded. The flowers are about 2 inches across. Sepals and petals nearly equal, lanceolate, and with a tapering thin point, pale yellow, blotched reddish-brown; lip lanceolate, apiculate, white, with a velvety reddish-brown blotch in the centre, and a few purple spots at the sides. It was imported by Messrs. F. Sander & Co., and flowered in their nursery. *James O'Brien.*

* *Bletia Godseffiana*, n. sp., Kränzlin.—Affinis Bl. floridæ R. Br. Bulbo v. cormo globoso; foliis longissimis linearilanceolatis acuminatissimis sesquipedalibus ¾ pollic. latis; scapo gracillimo ad 2 pedes alto supra racemoso ad 10-floro; bracteis minutis triangulis; ovariis levit-rasperatis; alabastris ante anthesin sparsim hyalino pilosis; sepalo dorsali ovato recto. lateralibus mentum modicum efformantibus triangulis subfalcatis viridibus extus et præcipue intuse purpureo-suffusis; petalis multo tenerioribus ovatis acutis albis roseo suffusis margine minutissime erosulis; labelli lobis lateralibus semiorbicularibus antice liberis obtusis; lobo intermedio e basi lato-lineari orbiculato (sc. expanso) margine quam maxime undulato medio emarginato; disco lineis elevatis 5 (adjectis 2 brevioribus) e basi labelli fere apicem usque decurrentibus ibique in dentes elevatulos exeuntibus; lobis lateralibus venis lobo intermedio) intense violaceo; lineis loborum lateralium ramulosis elevatulis instructis; labello albido antice, præsertim violaceis, carinis disci aureis; gynostemio valde curvato basi in pedem brevem producto, apice paulum dilatato. Totus flos pollicem diametro.

† *Odontoglossum Kranzlinii*, n. sp.—Pseudobulbs ovate, compressed, marbled with brown, diphyllous; leaves ovate oblong, ascending; scape longer than the leaves, branched; flowers many, 2 inches diameter, sepals and petals narrowly lanceolate, and with a tapering point, lip three-lobed, the middle one lanceolate, toothed, apiculate, bearing a reddish-brown velvety blotch in the middle, crest, two small, plain, blunt, white teeth; column white, spotted with red at the base, the wings bearing two long recurved cirri, with a few inconspicuous hairs at the base.—Introduced from Colombia, and flowered by Messrs. F. Sander & Co. *J. O'Brien.*

Orchid Notes and Gleanings.

Lælio-Cattleya amœna × Var. delicata.

Lælio-Cattleya amœna is a hybrid out of Cattleya Loddigesii, by the pollen of Lælia Perrini. The variety in question flowers in October and November. The flowers are large, with lanceolate rosy-lilac segments, the lip convolute at the base, is white, the throat yellow, the anterior lobe pointed, and of deep violet at the extreme tip. *Lindenia*, 367.

(crassinode × Wardianum); the lovely D. euosmum leucopterum (endocharis × nobile), D. × dulce (Linawianum × aureum), a pretty Veitchian hybrid; D. × Venus, D. Wardianum album, the varieties of D. Dalhousieanum, &c.; and to continue the show of Dendrobiums, a large number are being kept in cool-houses, to be brought on as they are required—the D. densiflorum, D. thyrsiflorum, and others of that section, are only just commencing to flower.

In the cool-houses was a great show of Odontoglossums, including superb spotted forms of O. crispum. Among them we noted O. c. xanthotis, a fine white, with yellow spots; O. c. Stevensii, which is well known to fame; O. Pescatorei Schroderiana, which is only to be excelled by that other fine purple-spotted form, only existing at The Dell, O. P. Veitchianum; O. Wilckeanum, of all shades of yellow and brown, the richest and finest being O. W. Godefroyanum. Two plants, each with several spikes, of the fine O. elegans, and a grand form of O. excellens were in bloom, as well as a quantity of O. excellens were in bloom, as well as a quantity of O. triumphans; O. Œrstedii, with thirty flowers; O. triumphans; O. Œrstedii, with thirty flowers; the unique pale yellow O. Amesianum, and many handsome hybrid Odontoglossums; the houses being brightened with pans of Sophronitis grandiflora; the rich dark scarlet Cochlioda Noezliana, Ada aurantiaca, and the mauve-crimson Cochlioda Vulcanica grandiflora.

In the Cattleya-houses, the forms of the beautiful and fragrant C. Schroderæ made the best show, and among these there was one with its labellum marked with purple, as in the typical C. labiata. Forms of C. Lawrenceana, too, were in bloom, one of the most striking being the wholly rosy-lilac C. L. concolor, with two spikes of four and five flowers respectively. Also among others in bloom were C. × calummata and that beautiful Dell hybrid C. × Baroness Schroder (Trianæ ♀, Jongheana ♂), with large soft pink flowers, the lip of a rich orange tint. In one corner was an interesting group of Epidendrums in flower, comprising E.

Fig. 64.—Ludovia crenifolia. Ornamental palm-like plant (see p. 442.)
(greatly reduced.)

Orchids at The Dell, Egham.

Those who have never seen the show of Orchids in Baron Schroder's famous garden in the flowering time of the spring Dendrobes, can have no conception of the beauty of the display that these plants then make. At the present time, despite the heavy requisition put upon them for cut flowers, some of the specimens of the varieties of D. nobile, D. × Ainsworthii, D. Wardianum, &c., are literally sheaves of flower. Some idea, however, may be gained when it is stated, that one of the plants of D. Wardianum bears over 200, and a single specimen of D. × Ainsworthii, over 400 blooms, and that the D. nobile varieties in some cases exceed these in numbers. Prominent by their beauty and distinctness, however, were D. Wardianum var. Schroderi with noble flowers, the segment coloured with purple back and front; D. × melanophthalmum, Reich.

In the Pitcher-plant-house plants of Dendrobium Dearei and Vanda teres were throwing up spikes most profusely; in an adjoining house was a fine show of varieties of Calanthe Regnierii, and a fine dark hybrid raised at The Dell between it and evectum, E. O'Brienianum ×, E. xanthinum, E. rhizophorum, E. Dellense ×, and E. Wallisii.

Among the many noble Cypripediums in flower, C. × Southgatense (bellatulum × Harrisianum) was distinct, its flowers spotted with purple. C. × Morganiæ was a grand sight in itself, one specimen having nine spikes, and bearing altogether twenty-nine flowers. C. Elliottianum was grandly in bloom, and the shining wax-like yellow flowers of C. Mastersianum exhibited it as one of the most distinct of the genus. Other Cypripediums finely in flower were C. × mycrochilum, C. × Harrisianum superbum, C. lævigatum, C. Lawenceanum Hyeanum, &c.

C. vestita oculata gigantea. Schomburgkia tibicinus was sending up flowers strongly, and the fine specimen of Sobralia xantholeuca will soon have fifty or sixty flowers open at one time.

Effectively arranged in the various houses were numerous specimens of Odontoglossum Rossii majus and O. Cervantesii, among the latter being several brightly-coloured O. C. lilicina; Dendrobium infundibulum and D. Jamesianum in the cool-houses, Angræcum Sanderianum and various species of Vandas in the Vanda-house, Masdevallia Houtteana, with over 100 buds; large plants of M. ignea, M. Veitchiana, M. Arnimii, M. × Chelsoni, M. Harryana, M. × Courtauldiana, the true M. Lindenii, the fine crimson and white M. Schroderiana, and other species in the Masdevallia-house. And in other houses were in bloom a beautiful specimen of the yellow and red Maxillaria Kimballiana, Oncidium Phalænopsis, O. luridum, O. ampliatum, Cymbidium Lowianum, with twenty spikes; the curious little Pleurothallis ornata; the new Lælia × vitellina, Mr. Ballantyne's latest hybrid production; a grand plant of the rare salmon-coloured Cœlogyne tomentosa, sending out numerous spikes; a noble specimen of Platyclinis glumacea; a fine plant of Cymbidium Devonianum, with several spikes; some noble Cœlogyne cristata alba, C. c. Lemoniana, &c.

Cypripedium Paris ×.

I see in the *Orchid Review* a Cypripedium called Paris, a cross between C. bellatulum and C. Stonei. This brings to my mind the last time that I went round the late Mr. Hall's Orchid-house, and his pointing with pride to a seedling having the same parentage as the above, and saying he thought he would be among the first with a C. bellatulum ×. It would be interesting to know who got his Orchids, as possibly this plant may have found its way to Mr. Measures' collection. Perhaps some of your correspondents may know what Mr. Hall's Orchids realised; as although not very numerous, they were very select. *Crispum.*

Orchids at Castle Hill.

In the gardens of Geo. C. Raphael, Esq., at Englefield Green, the cool Orchid-house contains a very beautiful and varied assortment of showy species in flower, the fine forms of the favourite Odontoglossum crispum, of course, predominating, and these are of excellent quality, embracing both the pure white and the spotted forms. Flowering out of them also are several very handsome hybrids, and among other noteworthy things are good forms of O. Hallii leucoglossum, O. H. xanthoglossum, and the various forms of O. luteo-purpureum; while giving a welcome show of brilliant colour are many suspended pans of Sophronitis grandiflora, with from ten to eighteen flowers each, and on the stages some bright orange-coloured Ada aurantiaca. The arrangement of the house, with its water-tanks the whole length, and its border of Ferns and Begonias on each side of the walk, seems well adapted to the culture of the plants grown in it, and, like other plants when really thriving, they are pleasant to look upon either in or out of flower.

In the other houses—in which Mr. Adams, the gardener, is doing his best to bring their occupants up to the good condition of the cool-house Orchids—there is a good show of Dendrobiums, from the charming D. linguæforme, with its numerous elegant sprays of white flowers, up to the noble D. Wardianum. D. aggregatum majus has many spikes, D. nobile albiflorum, and D. n. elegans are fine, and Cœlogyne ocellata maxima, Leptotis bicolor, Trichopilia suavis, Anselia africana, Angræcum citratum, Vanda tricolor, Cypripediums, and various other species are in bloom.

Among the Phalænopsis, the pretty ivory-white P. Micholitzii is found to be one of the most satisfactory, as it is free to grow, and an almost perpetual flowerer. Two other highly satisfactory plants which are in great favour with Mr. Raphael are in flower, Cochlioda Noezliana having three branched spikes of its dark scarlet bloom, one of the plantsmanship; and Cochlioda Vulcanica grandiflora, the plants of which have been blooming here for the last six weeks, and will continue for six weeks or so longer. They are in fine health, and both these species are grown suspended in a cool intermediate-house.

The Rosery.

ROSES IN A COLD HOUSE.

There are few subjects more suitable for cultivation in an unheated greenhouse than Roses, and when well attended to, perhaps, none give better results. The flowers are easily secured some six weeks earlier than any appear out-of-doors, and will continue until midsummer. Blooms that have been grown on steadily, as must necessarily be the case in an unheated structure, are much heavier, and last considerably longer, than those produced under hard forcing. The protection given from severe frost and keen winds, together with their exemption from the too sudden changes of spring-time, are all in favour of really good blooms. The chief point is to avoid bringing the plants on too early. This is best secured by starting them as late as possible, and by affording all the ventilation they will bear up to the time young growth has started. After this period, it is better to avoid the admission of air as much as possible, because there is no more fruitful cause of mildew than a draught of any kind, and sudden changes in the temperature. By the end of March and April the plants are in young leaf, and it needs some care and judgment to avoid the temperature of the house rising too high upon bright days. If possible, it will be much best to have some blinds fitted to rollers, so that the sun's rays can be subdued during mid-day of such weather. It is not necessary to shade all of the glass; narrow portions of blind at intervals would answer the purpose; or the glass may be very slightly shaded with a thin summer wash. More often than not, these washes are not put on soon enough; a little down the centre of the pane is a great help, and does not shade or darken the house too much. Aridity of the air may also be obviated considerably by sprinkling a little water about during bright days, and the foliage will derive much relief from such practice. Very little atmospheric moisture will be sufficient, and a dry air is better at night until the season is more advanced.

Too much care cannot be given to the destruction and checking of insects affecting these plants as soon as they appear. Taken in time, this is a very easy matter; but when left for a few days, they increase at an astonishing rate. I would caution growers against using any of the insecticides now in the market in a too strong solution, it being better to do the work twice over than spoil the prospects of a season; and two applications of a weak solution will usually effect the required object without hurting the plants.

In my own cool-house of Roses, I am about to commence pruning [last month. Ed.] The plants are turned out into the borders, and consist of strong-growing Teas of the Dijon class, and a few of the choicer kinds, such as Comtesse de Nadaillac, The Bride, C. Mermet, J. Ducher, Souvenir d'un Ami, P. des Jardins, Anna Olivier, &c. There is very little pruning to be done, because all weakly-growing shoots were removed at the end of the summer. I am more than ever convinced that more pruning and thinning of the wood should be done during summer and autumn. This aids in the production of good, strong, and well-matured wood. All of the numerous, weak lateral growths take their share of nourishment from the plant to waste, as they are cut away at pruning-time, and it is much better to concentrate vigour in the wood that is destined to bear good blooms the following season; at the same time you are admitting more air and light into your plant, and this is a great essential in producing well-matured wood. Instead of cutting a strong sucker-like shoot of C. Mermet or Perle des Jardins back to three or six eyes, I prefer to leave them quite two-thirds of their length, and bend them over, as much as room will permit. In fact, treating them somewhat after the way adopted with pegged-down Roses out-of-doors. This results in many more good blooms being secured from the first crop, and, needless to say, these are of more than double the value of those produced at the second cutting. It seems such a pity, as well as being unreasonable, to cut away so much of these sound and well-ripened shoots, as is the practice with many.

There is the further advantage attached to the bending down of these shoots, in admitting more air to the centre of the plants, and thus giving more room and encouragement for other strong growths from the bottom of the plants, either in the way of suckers, or those from the base of strong shoots.

After pruning is done, and previous to tying, or otherwise securing these shoots, I rake off as much of the surface soil as can be done without injuring the roots, and mulch heavily with a compost of loam and thoroughly rotted manure, using these in about equal proportions. The borders do not receive any water then, as I have no wish to excite either the wood or roots for some time afterwards. During March, when young growths are active, the borders should receive a thorough soaking with weak liquid manure, and from this time onwards they will be similarly treated at intervals of about three weeks. Mere surface-waterings are useless.

Some of the best Roses I have ever seen from under glass have been grown in this way, and very heavy crops of blooms are easily realised during the late spring months. The plants will also produce a grand second crop of flowers during early summer, after which it will be well to throw the house open as much as possible; but I would still attend to the plants in the matter of water, and cleanliness from insect pests. All through the summer and late autumn you may cut some good and beautifully clean flowers from such plants, and which will be doubly acceptable during stormy or wet weather.

In the budding of Teas and Noisettes it is often a difficult matter to find buds that are sufficiently ripe for the purpose upon plants growing in the open air, and, under the most favourable conditions, these are found somewhat late in the season. A few plants under glass will throw a large number of well-matured buds, and which will come in very handy for working the earliest stocks. Of the two, I prefer buds of Teas from under glass to those grown in the open air, and it is easier to get buds of such succulent varieties as Marie van Houtte, Souvenir d'Elise Vardon, Comtesse de Nadaillac, &c., under these conditions. Our more tender Roses, such as the last-named, and also the extra double and globular varieties, like La Boule d'Or, are almost sure to succeed in a cool house, if treated as here described. When fastening the long shoots of climbers, whether to the walls or rafters, it is much better to have them some 6 or 9 inches away from the wall or glass, especially the latter. The young growths are certain to turn towards the light, and a frost is very disastrous to the tips of the young shoots when they are in contact with it. *A. P.*

Cultural Memoranda.

ASCLEPIAS CURASSAVICA.

This attractive, though little grown stove herb, when seen at its best is a beautiful plant, and it is surprising that it is not more frequently met with in gardens. Its orange-scarlet flowers, which are produced in large clusters from the axils of the leaves, produce a pleasing display, and they are produced from six to eight weeks in succession. Its culture is not difficult, although careful attention is required for the fullest success. From seeds sown in a gentle heat in March and April, nice useful plants may be raised that will flower from July to September. The young plants should be pricked-out singly when large enough into 60's, and shifted

on as often as the pots become filled with roots, up to the time that flowering commences. In order to have very bushy specimens, the points of the shoots should be stopped when they have made three or four joints, and at which stage the plants require to be kept close in a moist atmosphere, and well syringed to encourage a free break. A compost of fibrous pasture-loam, leaf-soil, and a sprinkling of rooted, potted and treated like the seedlings. Firm potting is a means to secure short-jointed bushy growth. When the pots have become full of roots, liquid farmyard manure may be applied with advantage. *G. Parrant, Rugby.*

Mulching and Watering Wall-Fruit Trees.

No time should be lost in loosening the surface-given at the roots of the trees after the fruit has stoned. There is no need to dwell upon the beneficial results attending the carrying out of the work indicated, further than saying, that were this work more generally practised, fewer complaints would be heard of stunted and blighted growth in wall trees, and consequently premature decay. If the fruit borders are heavily mulched from end to end and

Fig. 65.—Dracæna sanderiana, leaves with green and silver stripes: Hort. Sander. (see p. 442.)

sand is a suitable one. After flowering is past, they may be gradually dried-off for one or two months at the depth of winter, but water must never be quite withheld. In March the plants are pruned-back to within 6 inches of the soil, and carefully watered and syringed to encourage growth, and when this has advanced somewhat, they are shook out of the soil and repotted. Cuttings may be taken when the shoots have made three or four joints, and placed in a hot-bed frame, and as soon as well

soil of borders in which Peach, Apricot, Cherry, and Plum trees are growing against south, east, and west walls, afterwards laying on 2 or 3 inches thick of short dung over the loosened soil 2½ feet on either side of the stems of the individual trees, and the same distance out from the wall, and then giving the whole a tub or two of water each, according to the size of the tree; repeating the application several times during the next few months. Where liquid manure is plentiful, good waterings of it should be

to a breadth of 4 feet, it will be all the better for the trees, first loosening the surface-soil to that extent. Having just completed the above-mentioned work here, it has occurred to me that a short note on the subject would prove both useful and opportune. *H. W. Ward, March* 28.

The Auricula.

There is now a goodly display of bloom, both on show and alpine varieties. The season has been very propitious, and the blossoms have opened well. It

is rather remarkable that an alpine plant should be so sensitive in its flowers as is the Auricula, for should they be caught by frost the chances are that their development will be stopped, and they will not open. This refers more especially to the edged varieties, the selfs and alpines not being so easily injured, and the yellow-flowered alpine wilding never fails to open well. The plants arranged in a low span-roofed house are a source of much enjoyment to the cultivator, and as the trusses develop, the seedlings flowering for the first time are eagerly watched in the expectation that something good may be found amongst them. The bloom will not remain long in good condition, unless the plants are shaded from bright sunshine. The effect of sun upon the flowers is to cause them to wither up, however fresh they may be. Shade from bright sunshine; ventilate as much as possible, without exposing the plants to high winds, which are very injurious. On calm dry days the lights may be drawn off entirely, so that the plants may be fully exposed to light and air. If a sharp frost set in, I keep it out by turning on the hot water. In our garden, the fires are kept going at this season, and the turning a valve lets in much or little heat; but the Auricula must not have more heat than is needed to keep out frost—forcing the Auricula is out of the question. I received a note from the Rev. F. D. Horner on this point; and he has discontinued, he says, the use of any heat in his Auricula-house for about twelve or fifteen years, and adds, that the flowers have done far better with a sufficiency of some non-conducting covering. The flowers are small in size, and the colours are not good, if the plants are forced into bloom before their natural time.

Repotting should commence as soon as the bloom passes away, unless it is intended to obtain seed, for it will not do to repot them if seed is being saved; but an Auricula fancier does not care to leave his plants to be burdened with ripening seeds, which do not mature until July, thus preventing the repotting of them until that time, and causing certain injury to the plants. *J. Douglas.*

Colonial Notes.

TRICHOCENTRUM IRIDIFOLIUM, *Lodd.*

During the past year (1892), a small epiphytical Orchid was brought in from the woods by one of our native plant collectors, who prides himself on knowing the home of every indigenous Orchid in the colony. This was submitted by Mr. Hart to the authorities at Kew, who kindly identified it as Trichocentrum iridifolium, Lodd. It is not mentioned in the *West Indian Flora*, and is probably new to this area.

Mucuna rostrata, *Benth.*

In the early part of the present year, I met with this plant climbing trees and shrubby vegetation near the sea-shore at Carenage, some 5 miles distant from Port of Spain, our chief town. The large red flowers are very handsome, and from a long distance form a marked contrast to the surrounding vegetation. I also met with the same plant on the banks of the Caroni, our largest fresh-water river, a few days subsequently. Dr. Rake, of the Island Medical Service, who takes great interest in all natural history objects, informs me that the plant is a friend of his of many years standing. It was previously brought into the Departmental Herbarium by D. W. Alexander, our native collector. In drying for the herbarium, great care has to be exercised to prevent both leaflets and flowers falling to pieces, and turning black. This plant was previously known only as a Guiana species, but, like many continental species, is now to be added to the insular flora of Trinidad. *W. E. Broadway, Botanical Department, Trinidad, B.W.I.*

The Week's Work.

THE ORCHID HOUSES.

By W. Holmes, *Gardener, Pickering Lodge, Timperley.*

EPIDENDRUM VITELLINUM MAJUS, if treated as advised in a previous Calendar, will now be making good spikes, and plants must receive more water and a daily syringing. We are now potting our stock of Calanthe Veitchii, C. vestita oculata, C. v. lutea. The best material I find is good fibrous loam, a little peat and fresh sphagum moss, with a little silver-sand well mixed. They were turned out of their pots a few weeks before potting-time, and laid in damp moss, and have now some nice new roots. The pots are half filled with clean crocks, upon which a layer of moss is put, finishing the operation with the above material, but leaving space for watering. I have seen good Calanthes grown by potting each bulb singly in small pots, and when nicely rooted potting them into their flowering pots; they require a hot moist atmosphere, such as a good plant-stove or Dendrobium-house, but should be placed so as not to get any water from the syringe, as the leaves are very sensitive to water lodging on the foliage. Fumigation is very injurious to them, causing the leaves to become spotted. Always remove the plants when this is done.

THE CATTLEYA-HOUSE.—The various specimens of Lælia purpurata and its varieties having made up their pseudobulbs, and been carefully rested for some weeks past, will now be showing flower-spikes, and they should be afforded a moister atmosphere, also more water than hitherto at the root. These species should always be grown at the warmer part of the Cattleya-house. As they make growth in the winter, it is very essential that progress be not checked from want of water, or from the admission of cold air. Amongst Lælia purpurata some very distinct forms are found, all of which are worthy of a place in the choicest collection. Lælia p. Russelliana and L. p. Schroderiana are light-coloured varieties, and very distinct from the type. All of these species and varieties flower at the same time, that is from the end of May to July. Then there is Lælia grandis, a good old plant and very distinct, nearly yellow in colour; and L. grandis tenebrosa is one of the finest of recent introductions, differing in its colour from L. purpurata or any other known Lælia or Cattleya. I find it one of the easiest plants to establish, having a good constitution, and growing freely under the treatment afforded L. purpurata. Any plants of these imported this spring, should be carefully washed in tepid water and potted in the usual manner, in clean crocks, no peat or moss being made use of till such time that formation of roots has begun. The plants can be kept firm in the pots by means of a few flower-sticks. After fixing them in pots, they should be syringed about the roots twice a day as a general rule, and by the end of six weeks the pseudobulbs will have become plump and fit for being potted and placed in growing quarters. The compost should consist of fibrous peat and broken brick.

FRUITS UNDER GLASS.

By M. Temple, *Gardener, Carron House, Stirlingshire.*

MELONS.—March was most favourable to the growth of early Melons, which should now be strong in stem and foliage, a condition imperative to fine development of fruit. It is unfortunate if shading has to be applied to protect foliage of Melons, as the fruit cannot have too much sun to give solidity and flavour. Laterals should be rubbed off when the fruit approaches the ripening stage; air should circulate freely, avoiding cold draughts; but foliage which has been well exposed will not suffer by judicious airing. The leaves should be green and healthy till the fruit is cut. Support to fruits not resting on the soil should be given before there is danger of the stems giving way from the weight of the fruit; net, wood in squares or circles, or flattish pans, perforated in the bottom to allow moisture to escape, are in general use for suspending the fruit. Withhold water somewhat, and liquid manure especially, as the ripening period approaches, but the foliage should not be allowed to flag. Plants, in pots filled with roots, are more liable to injury than when the plants are grown in beds. In pits, heated by manure, there is more difficulty in setting and ripening fruit; an even temperature should be maintained, as far as possible, by frequently adding fresh linings of manure and leaves, well-sweetened by turning. Hot steam should be allowed to escape by a chink of air being left at top of structure. In small close places, the fruit should be elevated clear of soil and foliage; flower-pots are very suitable for this purpose. Cracking is caused by allowing the roots to become dry, and afterwards freely affording water when the skin has become hard and woody. Plants setting their fruit must not be kept close and damp; remove fruit not wanted before it robs the plants. Keep foliage of succession plants healthy and strong, by airing liberally and preventing shoots becoming crowded. Sow seeds for succession crops as required.

PEACHES.—Early crops approaching the ripening period should not have water, except when necessary to keep the roots healthy and active. All fruits should be freely exposed to the sun and air, clear of the foliage. A circulation of air night and day does much to increase flavour and high colour. No more growths than required for next year's bearing-wood should remain, any which are growing unduly gross should be stopped; we often press such down so as to half separate them from the branches with good results. Disbudding of succession trees requires timely attention; removing ruthlessly large quantities of shoots is injurious to the present crop, and conducive to bad health in the future. Syringe freely after hot sunshine with tepid water, and give moisture liberally to the roots; liquid-manure judiciously given to the trees bearing heavy crops, or to such trees as are weakly, is of advantage. The temperature may rise to 75° when the sun is bright. Some of the well-known manures forked into the surface-soil and watered well immediately afterwards, are good fertilisers for Peaches and Nectarines. Late crops which have set or are setting their fruit, should not be unduly excited, but cold currents of air should be avoided. When the fruit is set, let the small and useless ones be removed, leaving those that are best, exposed to light. Do not thin severely till stoning is past. Fumigate if black or other aphis should appear.

FIGS.—Those in full growth should have liberal waterings, and if the roots are confined in pots or in brick divisions, liquid-manure will aid them much. Drought at the roots causes fruit dropping. Mulching may be serviceable to roots near the surface. Continuous stopping and thinning of shoots is indispensable in maintaining an even and fruit-bearing growth. Withhold water when the ripening of the fruit approaches, and increase ventilation. Late trees should be allowed to move slowly, allowing the temperature to rise gradually; give a liberal watering, and keep the surface of soil open.

THE KITCHEN GARDEN.

By H. C. Prinsep, *Gardener, Buxted Park, Uckfield.*

WATERING CROPS.—The drying winds and hot sun lately experienced have not been favourable to newly-planted vegetables, especially those not lifted with a ball of earth. Where Cauliflowers, Lettuces, and other small plants have been set out, watering and shade will be necessary till they become established. We have had no rain in this district for some time, and the ground is baked quite hard, unless recently dug. On such soil, it is impossible to sow or plant with a chance of success till the soil is moistened; and unless rain soon falls, it must be moistened artificially if fine seeds are to be sown. Even land that will be planted must be well watered, or, at the very least, the furrows where the plants will stand. In some soils it will be better to defer planting till the weather changes, for unless watering can be efficiently done, no progress would be made; many plants, on the contrary, would perish. In watering any crop it should be done early in the day, so that the soil may become warmed somewhat before nightfall.

PEAS.—These crops will now require much attention. It is seldom that Peas sown in the open ground at the end of January have progressed so rapidly as is the case this season. During the latter part of March and the beginning of this month growth was very rapid, and it is tender. In gardens which are situated in valleys where spring frosts are a danger, material for protecting the Peas should be kept in readiness. Here Peas have been cut off while in blossom in May, whilst my neighbours on higher ground have not suffered in the least. Another sowing of Peas may be made, this time selecting the choicest Marrowfat varieties. Put sticks to those far enough advanced to require them, and the early lots may have a mulching of strawy cow manure, which will keep the soil in a moist state, and when water is applied, the goodness of the manure will be carried down to the roots.

CHICORY.—A small sowing may be made, to afford some early roots, but the general sowing should be deferred for another fortnight.

FRENCH BEANS.—In warm situations a sowing should be made at this date. At the foot of a south wall, or on a warm border, are

good places. The seed should be sown rather thickly, as some will not germinate if the weather should be cold. No protection is required till the plants appear above ground, as the sun will warm the soil sufficient to cause germination. I have had good results from sowings made in the paths between the Asparagus beds, where the soil was taken out for arching over the beds. By covering with glass in the same way as is recommended for Early Peas, the sun's heat was retained in the soil, thus causing the seeds to germinate very freely. The pieces of glass should be long enough to rest on the edges of the beds, so that a space of about 6 inches would be left between them and the soil. Seeds of Kidney Beans are sown in pots, afterwards planting them out, but it will be better to defer doing the planting out of such for another week, plants so raised being very tender. Beans in pits and on hot beds must have constant attention. Ventilate freely on favourable days, and keep the soil moist, for unless pods grow quickly, they are tough eating. Syringe the plants on sunny days to keep down red-spider, but during dull or showery weather this may be dispensed with, except in pits where the hot-water pipes may dry up the superfluous moisture, and keep a night temperature of 58° to 60°.

PLANTS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

FITTONIAS, CYRTODEIRAS, SONERILAS, PANICUM VARIEGATUM should be divided and repotted. They are very useful plants for dinner-table decoration, or for growing over the pots of large plants in a warm house, or for baskets and rockwork; they like peat, leaf-mould, and an abundance of moisture. Cycads that require potting, or the drainage attended to, should be seen to at once before they make young leaves. Useful hardy variegated plants for growing in pots for decorative purposes are Elæagnus aureus variegatus, Euonymus variegatus, Eurya latifolia variegata, Vinca variegata, and V. aurea variegata. Sow seeds of Primula sinensis for succession, also P. obconica in boxes or pans, water the soil well before sowing, and then cover the seed with fine light soil, place in heat and shade with brown paper; remove to a cool house as soon as the plants are seen. Also sow seeds of Balsams, Coxcombs, Amaranthus for growing in pots, Musa ensete, Dracæna indivisa, and D. australis.

CAMELLIAS.—Prune-in any plants requiring the knife, afford abundance of water unless the pruning is very severe, and slight shade in bright weather; freely syringe. Where shading cannot be utilised, it is best not to syringe them in the mornings of bright days, as the leaves would be scorched considerably when wet.

TUBEROUS-ROOTED BEGONIAS that were started into growth in warmth, if in small pots, should be re-potted as soon as a good start has been made, keeping them in warmth for a few days after the re-potting, and removing them to a cooler house, where there is plenty of light and air. The plants will be the better for a little shade during bright sunshine. As a potting-soil use good loam, peat and manure, with a small quantity of clean coarse sand; and the pots should be well-drained.

FUCHSIAS.—Cuttings which are rooted should be potted off in rich, finely-sifted soil on this occasion, but they should not be stopped, placing them in heat again for a time. Attend to the staking of specimen pyramid and standard plants. The less training Fuchsias are subjected to, the better they look, their natural habit being good, and there is nothing more beautiful than a fine standard Fuchsia. None of the shoots should be stopped after this date, and liquid manure should be afforded freely, with abundance of air, a little shade being applied in hot weather.

CYTISUS RACEMOSUS which have done flowering may be pruned hard, and repotted when a fresh start is made. The Cytisus likes loam, leaf-mould, a little peat, some good manure, with sea-sand, and to be grown in pots that are well-drained. The plants are useful in various sizes for decorative purposes, and one of the most attractive at this season is the hardy Bronze Broom, Cytisus scoparius Andreanus, whose flowers at a distance put one in mind of a small Pansy. It flowers well in small pots.

HERBACEOUS CALCEOLARIAS AND CINERARIAS will require frequent fumigation to keep green-fly in check, and shading from bright sunshine. Calceolarias should be neatly staked with green-painted stakes as fast as they require it. A house with northern aspect is the best place for them at this season.

MALMAISON AND OTHER CARNATIONS IN POTS should be staked and trained as the flower-stems grow in length. Fumigate well once in three weeks, do not let green-fly be seen on them, and be not stingy with manure-water in a weak state; clear soot-water or a spoonful of blood-manure being used at times.

THE FLOWER GARDEN.

By T. H. Crasp, *Gardener, Canford Manor, Wimborne.*

ANEMONE CORONARIA. — Anemones generally are plants of much beauty, and none is more valued in the flower garden than A. coronaria, which is in flower at this season and onwards till the end of the month of June, and occasionally later; and, in fact, if seeds are sown at intervals throughout the year, flowers may be had in bloom nearly all the year round. No particular kind of soil is really necessary for them, although full success is assured by good rich soil—in fact, the richer the soil is, the better the plants do. If seeds be sown now, a good display of bloom should result next spring. The soil should be made very fine on the surface and for a few inches deep, and shallow drills drawn about 6 inches apart, the seed being sown thinly, and covered with some fine light kind of soil. The seedlings should be kept free of weeds throughout the year, and when they are about 2 inches in height, a portion of them, where too thickly standing, may be transplanted to other places, choosing showery weather for this operation. The practice of sowing the seed as soon as it is ripe also answers very well, only the seedlings are longer before the bulk of them flower. It is nearly always advisable to raise a bed of seedlings yearly, although, at the same time, if the old roots are undisturbed, and the bed manured at the surface, they will continue to bloom satisfactorily for several years.

BEDDING PLANTS.—All work connected with these plants should be pushed on quickly, in order to lessen the pressure of work when bedding-out commences. Much labour and time may be saved in preparing ordinary bedding plants by making up mild hot-beds for the more tender kinds, and utilising spare frames, handlights, &c., for others that are hardier. These frames, &c., should have a layer of rich light soil about 3 or 4 inches in depth placed in them, in which seedlings and rooted cuttings may be pricked out. Here these things will grow fast, and take up less room than when boxed or potted, and make quite as good plants. The following are a few subjects which do well under such treatment:—Lobelia, Golden Feather, Ageratum, German Aster, Stocks, Zinnia, Marigold, Coleus, Alternanthera, and Iresine. The hardening-off of plants is an important matter connected with tender plants for the flower garden, for if these are not carefully inured to full exposure before being planted out, a long time is lost in recovering their vigour and health. Even in the matter of hardening off plants, the exposure should be very gradual, and at first the glass should be kept over the plants, but affording them air freely after the first four or five days, weather permitting, till the foliage acquires a greater degree of firmness, after which time the lights may be drawn off them entirely on fine days, and so on, till the glass protection is entirely dispensed with. Plants from out of shaded vineries or Peach-houses if exposed to full sunlight at once get their foliage burned, and for these and similarly-grown subjects, a thin shade is needed for a time during bright sunshine.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

STRAWBERRIES.—If the plantations have been hoed and cleared of weeds, they are now in the best state for the placing of litter among the plants. The litter for plantations made last autumn cannot be too long and fresh, and where the supply is limited, and it has been left to accumulate for the past two or three weeks, the freshest and longest only should be selected for the new plantation, whilst the shorter portion will be equally suitable for older plantations, as it will contain more nutriment. Litter should be afforded the plants now, because any rain that will fall whilst bleaching and leaving the litter in a clean state for the fruit when ripe, will also wash the ammonia which it contains down to the roots, and encourage growth. Afford a final watering of liquid manure before the flower trusses are too forward.

PLANTING OUT FORCED PLANTS.—Where the practice obtains of making plantations with forced plants, which, however, I do not recommend, preferring runners layered in July and planted out early in the month of August, the ground now being cleared of Broccolis, offers a suitable place for them, and should be prepared by deeply trenching the ground, and using a liberal dressing of manure; afterwards making it thoroughly firm by treading, and waiting for suitable weather before planting out. The earliest forced plants should be avoided as having been subjected to too hard forcing; and they are generally infested by red-spider. Plants from which fruit is gathered from now onwards are to be preferred. Remove flower trusses from the plants which were put out last autumn for supplying early runners, and grub up any that are blind or barren.

GENERAL REMARKS. — Unless a change to much colder weather than we have at present should occur, nets may now be entirely removed from Pears, Plums, and sweet Cherries on walls, also Apricots, and the covering on Peaches and Nectarines reduced one or two coverings, according to the weight of the nets. The cold and dry north-east wind, which has prevailed for so long, being favourable to the appearance of aphis, seize every opportunity afforded by mild days to wage war against them, and especially on Peaches, Nectarines, Sweet Cherries, and Plums, all of these being now sufficiently advanced to render them quite safe to be operated upon, and certainly no work at present is more urgent and important. Soapsuds, to every 30 gallons of which a pint or quart of tobacco-juice is added, according to the strength of the same, is the safest insecticide to use for the present.

THE APIARY.

By Expert.

SEASONABLE HINTS.—March was an exceptionally fine month, and there was scarcely a day on which bees were not flying abroad. Breeding went on at a great pace, and at the time of writing, honey is coming in from the most abundant Plum and Pear blossom, which has caused artificial feeders to be quite neglected. This natural increase of stores will stimulate bees to increased brood-rearing. When a change of weather comes, and honey ceases for a time to be brought in, it will be important to go on with store-syrup feeding until the bees can gather it again, giving just as much as they can consume, as it were, from hand to mouth. Vegetation being so much in advance this year, makes it absolutely necessary not to neglect anything that will conduce to get stocks at their full strength correspondingly earlier than would be required in an ordinary season. If a spell of cold weather come upon us, as is almost sure to be the case, it will also be advisable to keep the entrances to the hives narrowed, and to put more wrappings on to the tops of the frames or hives, so as to lessen the risk of the larvæ getting chilled, and the prosperity of the colonies retarded. Fine weather often tempts bee-keepers to go ahead too fast, and increase the capacity of hives by putting on supers, or adding frames long before the bees are strong enough to utilise them. It is only safe at present to give an additional frame or two, next the brood nest, where there is evidence that the queen has not sufficient space for depositing her eggs.

It is surprising how helpful it is to bee-keepers to keep a record of passing events in the apiary: this can be done by means of a diary, or, what is better, a slate or piece of paper attached to the inside of the roof of each hive, on which memoranda can be written. Entries should be made as to the condition in which colonies are found from time to time, age of queens, dates of swarms, when supers were put on and taken off, periods at which honey is being stored, and the time of blooming of various honey and pollen-yielding plants, &c. If these records are kept from year to year, they will be found to be not only interesting for making comparisons, but really valuable data for future guidance.

Get ready frames filled with full sheets of brood foundation, and get these made up and fitted into the crates, as the time will soon arrive when they will be required. Also make sure that enough spare hives are on hand to accommodate swarms.

EDITORIAL NOTICES.

Letters for Publication.—*All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* written on one side only of the paper, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for contributions, or to return unused communications, or illustrations, unless by special arrangement.*

Plants, &c., to be Named.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Illustrations.—*Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited; but the Editor cannot be responsible for loss or injury.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Advertisements should be sent to the PUBLISHER.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—48°.7.

Alphonse de Candolle.

The death of Alphonse de Candolle removes from us one of the foremost botanists of his time. In his loss we have another factor in that great change which has come over the study of botany during the last quarter of a century. Previous to that time systematic botany held the field, and other departments of equal importance were relatively neglected. Now the pendulum has passed to the other extreme, and microscopical anatomy and physiology occupy the almost exclusive attention of the student. This devotion to one branch instead of to all in their relative degrees of importance is very unscientific, and in some respects is much to be lamented. It is part of the specialising tendency of our times—partly the outcome of the division of labour, necessitated by the enormous development of the subject, and the consequent impossibility of any one man making himself an adept in all divisions of the science. We allude to it here because there is no doubt that the death of Alphonse de Candolle will but mark another stage in the progression above alluded to. De Candolle himself, though most widely known as a systematist, was, in reality, what gardeners call an "all round man," as will be made apparent when we consider in what direction his work was carried on. By botanists throughout the world de Candolle, of course, was fittingly honoured as among the foremost of his fellows. The heritor of an honoured name, he added lustre even to so great reputation as that of his father Auguste Pyramus de Candolle, the author of the *Théorie Elementaire*, and the founder of the *Prodromus*. Among gardeners the name of de Candolle is also more or less familiar, but as the late distinguished naturalist did not devote much of his time to the applications of science to horticulture, he was not much known in horticultural circles. Nevertheless, the principles expounded in his monumental *Géographie Botanique*, are necessarily, to a large extent, those which govern the cultivation of plants, whether in the open air or under protection. On one occasion—it was a memorable one—de Candolle did come into contact with the horticulturists of the world gathered together at the London Botanical Congress and Exhibition of 1866. At that time de Candolle presided over the Congress, the meetings of which were held in the Raphael Cartoon Room of the South Kensington Museum. In his address, he laid down the proposition that it was not sufficient for horticulturists to gaze at and admire the objects exhibited at a flower-show, they must study and they must reflect; that botanists similarly must not only examine accurately and analyse minutely, they must also study the plant as a whole and in masses, individually and relatively. The president then went on to enunciate the aid which horticulture could render to botany, and reciprocally the benefits that botany could bestow on horticulture. He pointed out how some of the most important data of physiological science had been investigated and determined in the garden, and he went on to show how much more might be done were an experimental house on a large scale erected for the elucidation of problems in vegetable physiology. Something, we may add parenthetically, has been done since, as, for instance, in the erection of the Jodrell laboratory at Kew; but one small laboratory, however excellent, is nothing at all proportionate to the needs of the case, and we are calmly allowing the Americans and the Germans to outstrip us; and as Prof. Virchow told us only a few days since, in such matters we are a quarter of a century behind Germany, and not only in educational matters generally, but specially in the formation of experimental stations and laboratories. M. de Candolle then went on to instance other advantages which the botanists derived from horticulture, alluding specially to the publication of such illustrated periodicals as the *Botanical Magazine*, and to the work of the Royal Horticultural Society at Chiswick, to that of Sir William Hooker at Kew, to that of Lindley, and of others who have known how to turn their botanical knowledge to the advantage of horticulture. Adverting to the beneficial influence of botany on horticulture, and alluding in particular to the importance of a knowledge of vegetable physiology, M. de Candolle showed that if owing to the imperfections of the science, or other unfavourable conditions, it was not always possible to bring physiology directly to bear on questions of practical cultivation, yet that indirectly much was to be gained, and many errors avoided by the teachings of physiology. Should some incompetent schemer or some quack promulgate erroneous ideas, they were, nowadays, easily refuted by reference to general principles. As to those discoveries made, as it is said, "by accident," Prof. de Candolle happily compared them to dreams and presentiments. If one in a thousand of these is realised, much is said about it. We hear nothing of the nine hundred and ninety-nine failures.

Practical men are influenced by theories of their own formation, which are usually baseless, and very often absurd; whilst the theories of the man of science are, or should be, based on the due estimate and appreciation of an aggregation of ascertained facts. The bearings of botanical geography on the introduction and cultivation of plants of economic importance were then discussed. If a distinguished geologist was able to predict the presence of gold in Australia before it was actually found there, so the botanist was able to say that the Olive and the Cork Oak would flourish in Australia. Several other instances of the kind were cited, and now of course their number could be largely added to. Contrasting the purely mercantile spirit of commercial men, on the one hand, and the aspirations of pure science, on the other, the President pointed out that whilst the commercial man, by becoming imbued with the spirit of scientific method, would cease to attach an undue importance to merely mercantile considerations, the scientific man on his side would lighten the technical and arid character of his studies by the study of the grandeur of Nature and the principles of art M. de Candolle happily ended his address by pointing out that the cultivation of flowers and the practice of landscape gardening, offered the best means of counteracting and bridging over the two extremes, by developing the sense of beauty.

We have alluded to M. de Candolle's address on this occasion, because it, all unconsciously, affords a fair idea of the bent of his mind and of the scope of his studies. In the following year (1867) de Candolle laid before the International Botanical Congress at Paris his "Lois de la Nomenclature Botanique," which, discussed and modified on subsequent occasions, form the basis upon which modern botanical nomenclature is based. Of late, however, there has been a regretable tendency on the part of such botanists as Dr. Kuntze and many of the American school, to break away from traditional usage, and by a strained interpretation of the law to generate great and needless confusion. With infinite patience and labour M. de Candolle continued the publication of successive volumes of the *Prodromus* and its continuation, contributing as many as twenty-six of the monographs himself, one of the most generally interesting being that on the Cupuliferæ (Oaks, &c.). His *Géographie Botanique*, published in 1855 in two volumes, is truly a monumental work in its aggregation of facts and results, and in their skilful marshalling. In these particulars it is comparable only with the works of Darwin, some of whose views were indeed something more than foreshadowed by the great Swiss botanist. This work was analysed at much length in these columns at the time by Sir Joseph Hooker, and, though recent researches in vegetable physiology especially, have detracted from the value of some portions of the book, yet as a whole it remains a store-house of carefully sifted facts, discussed, as we have said, with logical acumen and arranged and classified in a manner to excite the admiration of the reader. It is obviously impossible for us here to allude to M. de Candolle's works in detail, but we may mention a few others—his *Origine des Plantes Cultivées*, of which an English translation has been published, is an amplification of the chapters devoted to the subject in the *Géographie Botanique*, and affords an interesting and instructive illustration of the manner in which the author brought to bear the facts of history, philology, meteorology, and geography on botanical science proper.

Another thoroughly charming book, in spite of the apparent dryness of its subject, is the one devoted to *La Phytographie*, or the art of describing plants, published in 1880. In it he considers the methods of describing plants, and of the adequate publication of the descriptions. It is quite impossible for us to speak at any length of this delightful book. To take it up and read its carefully-balanced paragraphs, its symmetrically-arranged arguments, with every

device of a practised author to facilitate the needs of the reader, is to experience such delight as only a thorough work of art can convey.

M. De Candolle advocates for technical purposes, the continued employment of Latin such as Linnæus wrote, clear, concise and having but one meaning for each word, and he points to models of good botanical writing as well as to examples of bad style. How many German books on descriptive botany are there, for instance, in which one may read page after page without coming to any definite statement! If one requires to gain an idea of the main peculiarities of any plant or group of plants, and of their resemblances to or differences from others, one has to wade through pages of involved writing, which too frequently induce headache and mental confusion before the goal is reached. Of such nature, unfortunately, are several of the accepted text-books of the present day. All this is pointed out with force by M. de Candolle in the book to which we are alluding, and we could only wish that writers and translators would carefully study and take to heart M. de Candolle's criticisms. A chronological survey of epoch-making books forms one of the most useful parts of *La Phytographie*, which ends with a series of chapters devoted to "preuves," or verification-tests of the correctness of descriptions, and of the sources whence such proofs may be obtained, including under this head a detailed list of the principal herbaria of the world. In this list indications are given of the whereabouts of the collections made by all the more celebrated collectors and travellers—information of the greatest value to working botanists. On one point we cannot agree with the distinguished author of *La Phytographie*, and that is in the low estimate he puts on the value of botanic gardens as instruments of research and of teaching. M. de Candolle seems to have had in mind the miserable establishments which used to be met with on the continent, where the plants were badly named, and worse cultivated, and the amount at the disposal of the Professor and the gardener grotesquely inadequate to the needs of the case. What gardens may do for botanical science—the only point considered by M. de Candolle—receives in this country a striking illustration in the magnificent establishment at Kew, where the interests of science are as much an object of anxious care as those of economic botany, horticulture, and refined pleasure.

COUNT KERCHOVE DE DENTERGHEM.

(President of the Société Royale d'Agriculture et de Botanique de Gand.)

Another most delightful book, and withal very ingenious, is M. de Candolle's *Histoire des Sciences et des Savants*, published in 1873. It is an application of the Darwinian principles of selection in the discussion of the condition and progress of science and its professors in various nations during the last 200 years, and is full of curious and interesting information, put together with that skill which was a special characteristic of the author. We cannot devote any more space to these books, but we earnestly commend *La Phytographie* to all in any way interested in botany, whether as amateurs or professionals; and the *Histoire des Sciences* to the intelligent general reader.

M. de Candolle did not lack marks of the esteem of his compeers; he was a foreign Associate of the Académie des Sciences, a foreign member of our own Royal Society; a Linnean Medal was conferred on him by the Linnean Society only a few years since. He was a Doctor of Laws of Oxford and of Cambridge and there was scarcely a scientific Society of any importance that was not proud to include him amongst its honorary members.

M. de Candolle died at his residence at Geneva on the 4th inst. in his eighty-seventh year. His wife had predeceased him some years, but his son Casimir, a well-known botanist, lives to perpetuate the glories of the family name.

Count Kerchove de Denterghem.—We are pleased to be able to lay before our readers the portrait of the president of the Société Royale d'Agriculture et de Botanique, as well as of the Cercle d'Arboriculture, and other associations connected with his favourite pursuits. Although an ardent politician, M. de Kerchove manages to find time to devote to agriculture, to horticulture, and to botany. He is ever to the fore when action is demanded in the interests of these subjects. He is not only a great worker, he is also a great organizer, and the quinquennial exhibition, which opens to the public on Sunday, bears the impress of his zealous co-operation and judicious management. The Count is a learned man, and a fluent and eloquent speaker. His kindness and courtesy to the foreign guests who visit Ghent on such occasions as this, are notorious, and his colleagues on the committee will readily admit that the success of these huge undertakings is largely due to the unceasing labour, the intelligence, the tact, and the judgment of their president. Like most busy men, Count Kerchove finds time to write books, and, moreover, he edits a horticultural journal, probably finding in such occupations a relief from the excitement and vexations of political life.

The *Revue de l'Horticulture Belge*, appears with exemplary regularity on the first of each month. The regularity of its appearance for years past is a contrast to the dilatory mode of publication which was once (it was long ago) characteristic of many continental horticultural journals. The *Revue* meets the wants of the intelligent amateurs and of the enterprising horticulturists of Belgium, whilst the sound sense and clearness of its cultural directions commend it to the notice of foreign readers also. In the conduct of the *Revue*, M. de Kerchove is associated with many of the best known and most respected horticulturists of Belgium. But the book by which M. de Kerchove is best known, is his treatise on Palms, entitled *Les Palmiers*. In this work are set forth in clear and elegant language, the principal facts relating to their geographical distribution at the present time, to their existence in a fossil condition in various strata, to their botanical structure, and to their classification. In addition, chapters are devoted to the history and literary association of Palms, whilst a special section is devoted to their cultivation. Forty coloured illustrations and ample indices go to make up a volume, of whose utility we can best convey an idea, by stating that it is on the most accessible shelf in the editor's library, where it is not suffered to remain undisturbed for long together.

Linnean Society.—On the occasion of the meeting on April 6, Professor Stewart, President, in the chair, Messrs. F. H. Baker and R. S. Standen were elected Fellows. The President took occasion to refer to the great loss which botanical science had sustained by the death, on April 4, of Professor Alphonse de Candolle, of Geneva, an announcement which was received with profound regret. Professor de Candolle was the senior foreign member of this Society, having been elected in May, 1850, and was the recipient of the Society's Gold Medal in 1889. Mr. Clement Reid exhibited and made some remarks upon the fruit of a South European Maple, Acer monspessulanum, from an interglacial deposit on the Hampshire coast. Mr. R. Lloyd Prosyer, who was present as a visitor, exhibited some rare British plants from the co. Armagh, and gave an account of their local distribution. A paper was then read by Mr. W. B. Hemsley, "On a Collection of Plants from the

Region of Lhassa," made by Surgeon-Captain Thorold, in 1891, and a further collection from the Kuenlem Plains, made by Captain Picot, in 1892. Some of the more interesting plants were exhibited, and critical remarks were offered by Messrs. C. B. Clarke, J. G. Baker, and Dr. Stapf. Dr. H. C. Sorby gave a demonstration with the oxy-hydrogen lantern, and exhibited a number of slides, which he had prepared of small marine organisms, many of them extremely beautiful, mounted transparently so as to show the internal structure.

—— A meeting of this Society will be held on April 20, at 8 p.m., when the following papers will be read:—"The Subterranean Crustacea of New Zealand, with some general remarks on the Fauna of Caves and Wells," by Chas. Chilton, F.L.S. "Notes on the Anatomy, Physiology, and Histology of the Chernetidæ, with special reference to the rudimentary stigmata, and to a new form of Trachea," by H. M. Bernard.

The Gardeners' Orphan Fund. — The monthly meeting of the committee took place at Anderton's Hotel, Fleet Street, on the 7th inst., Mr. William Marshall presiding. The Hon. Secretary announced that H.R.H. the Duchess of Albany had permitted her name to be announced as a supporter of the Fund; also the following special donations and subscriptions:—H.R H. the Duke of York, K.G., £5 (donation); the Countess of Shrewsbury, £1 (annual); Lady Gordon Lennox, £1 1*s.* (annual); Mr. J. Kipling, The Gardens, Knebworth, Stevenage, £7, the proceeds on throwing open the lake for skating during the winter; Mr. J. P. Leadbetter, The Gardens, Tranby Croft, Hessle, Hull, collecting card, 12*s.*; Mr. J. Willard, The Gardens, Holly Lodge, Highgate, box, £1 7*s.* 6*d.*; Messrs. H. Cannell & Son, Nurserymen, Swanley, box, £1; Mr. T. Turton, The Gardens, Maiden Erleigh, Reading, box, 16*s.*; and the Liverpool Horticultural Association box, 10*s.* 6*d.* The Hon. Secretary announced in reference to the annual dinner, that at the request of the Chairman, Baron Ferdinand de Rothschild, M.P., the date had been postponed until April 26. The Hon. Secretary was instructed to make the necessary arrangements for carrying out the annual national collection on behalf of the Fund as heretofore. A cheque was drawn for the quarterly allowances to children upon the Fund, amounting to £186 6*s.* The chairman called attention to the annual dinner, and expressed a hope that the supporters of the Fund would muster in strong force at St. James's Hall on the 26th inst., so that it might prove as successful as the last one.

Technical Instruction. — Mr. Slade, the instructor engaged by the Williton District Technical Instruction Committee, commenced his course of instruction at Williton, Somerset, on the 5th inst., when he visited Mr. J. J. Risdon's orchard in the morning and Mr. W. H. Farrar's garden in the afternoon. In the orchard he gave instructions as to thinning-out and pruning trees, root-pruning, and the best-paying sorts of Apples to grow having regard to soil and climate. In the garden he showed the methods of training wall fruit-trees, winter-pruning, disbudding, the treatment of green-fly, and indicated what sorts of Grapes, Peaches, and Plums were most likely to pay. He also dwelt on the different methods of treatment for cordon, pyramid, and espalier trees. On the following days, Mr. Slade gave instruction in other gardens and orchards. On Wednesday evening he gave a lecture in the Egremont Hotel Assembly Room. There was a very small attendance. The lecturer confined his remarks mainly to a description of the forms of grafting and the management of orchards generally. Speaking of the orchards which he had seen in the district, he said many of them were almost as bad as woods as regarded their cultivation, the trees being so close to one another; while in others he found that they were facing the north, being backed up on the south and south-western sides by Elm trees. These were most serious defects, as Elm trees were about the worst trees they could plant near an orchard; while, with regard to position, they should in planting an orchard always let it face the south or south-west so as to secure as much sunshine as possible. He next proceeded to explain the best methods to be adopted in the laying-out of an orchard, including the depth at which the trees should be planted in the ground, the distance between them, and the amount of space required between the separate rows, also giving advice as to the application of manures. In dealing with the subject of grafting, he recommended the splice method for young trees, and the crown method for older ones. Further instructions as to pruning, &c., were next detailed, this being followed by a description of the best method of ridding the trees of insect pests. Several fine specimens of Apples were shown by the lecturer, who also gave advice as to the best kinds of Apples to be grown both for cooking and dessert purposes. The remainder of the lecture was devoted to the explanation of the cultivation of Peaches, Gooseberries, Black, White, and Red Currants, Strawberries, &c. Several suggestions as to the time of planting, the distance required between each plant, the quantity of manure required to replenish the soil, and also the best time for transplanting, were made by the lecturer, who also mentioned the most favourable sites for planting any of the above-named.

United Horticultural Benefit and Provident Society.—The monthly meeting of the above was held at the Caledonian Hotel, Adelphi, on Monday evening last, the Chair being taken at 8 o'clock by Mr. George Kelf, when the usual business of the society was transacted. Five new members were elected, three others nominated, and S. M. Segar, Esq., became a honorary member.

Gardening and Forestry Exhibition at Earl's Court.—What will, doubtless, prove an interesting, educational object lesson to the visitors to this exhibition is in preparation for the Exhibition Syndicate by Messrs. J. Cheal & Sons, nurserymen, Crawley, Sussex. This consists of various forms of and planting of fruit trees. They will show an orchard, market plantations, and kitchen gardens and walls, exemplifying in these the different methods of planting, pruning, and training of fruit trees, and the fine examples the trees used are, bristling with fruit-buds. Of the various forms of training to be exhibited, may be mentioned the horizontal, oblique, and the arch-forming cordons (which latter style of fruit-growing Messrs. Cheal have done much to successfully develop), also the bush, pyramidal, and diamond-trained trees, dwarf and espalier standards, &c., all good examples of their kind. Then, again, very worthy of notice will be found various forms of training and planting Currants and Gooseberries.

Tillandsia xiphioides var. arequita.—A beautiful Bromeliad discovered by M. Ed. André in the province of Minas, Uruguay, on rocks. The leaves are lanceolate, silvery-grey in colour, and from the centre of the tuft uprises the flower-spike with numerous boat-shaped bracts, from the axil of which proceed snow-white flowers. It is a very beautiful form, which will be distributed by M. Sallier, of Neuilly, Seine. *Revue Horticole*, April, t. 156.

Torquay District Gardeners' Association.—The first annual meeting of the above society was held on March 28. The secretary reported a membership of 120, many fresh names being promised for next session. There is a balance in hand of over £10. Several additional features are contemplated, amongst them the formation of a library, prizes for essays, &c. The summer outing will probably be to Taunton Flower Show on August 10. W. Lavers, Esq., is president, and Mr. F. C. Smale, hon. sec.

Stock-taking: March.—Holidays as a rule, have a knack of altering totals and interfering with dates of publication. Thus, but for Good Friday, the Trade Returns for the month of March would have been published on the 7th instead of on the 8th of April; the decrease in imports considerably reduced, and the exports for the month balanced those for 1892. Of the items constituting the summary table of imports for the month, six show an increase, and six a decrease, the latter preponderating, as in part shown by the following extracts:—

Imports.	1892.	1893.	Difference.
	£.	£.	£.
Total value for month	£36,793,194	£34,089,413	—2,703,781
§II.—(A.) Articles of food and drink—duty free	12,025,337	11,674,465	—350,902
(B.) — do., dutiable	2,319,861	2,242,860	—77,001
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)...	8,015,017	5,876,166	—2,138,851
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	2,692,545	2,450,455	—242,090
§IX. — Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,301,134	1,487,710	+186,576
(B.)—Parcel Post ...	34,186	44,600	+10,414

The enormous importation of Wheat and Potatos is suggesting to some the fatting of pigs on the former, and the employment of the latter (boiled) in obtaining milk and butter of a good quality at a remunerative outlay. Doubtless, exhaustive experiments will determine the value of both articles of food. Here a note may be made that the imports for the past quarter of the year are valued at £96,944,949 against £110,136,369 for the same period in 1892, or a decrease of £13,191,402; this shows the improvement which has taken place in the third month of the quarter. The figures in the accompanying excerpt from the general mass in the Return possess much interest for all. As the season advances equal interest will certainly be found in the quantity of fruit and vegetables supplied by the colonies and foreign countries. The items for March are as follows:—

Imports.	1892.	1893.	Difference.
Fruits, raw:—			
Apples ... ... bush.	351,814	332,724	—19,090
Cherries ... ... ,,	...	...	...
Plums ... ... ,,	...	...	...
Pears ... ... ,,	1,754	1,100	—654
Grapes ... ... ,,	777	2,134	+1,357
Unenumerated, ,,	19,528	34,970	+15,442
Onions ... ... ,,	254,058	223,504	—30,554
Potatos ... ... cwt.	76,076	216,153	+140,077
Vegetables, unenumerated, raw, ... value	£61,082	£84,578	+£23,496

Open-air Advertising. — A correspondent writes:—"In these days of novelties in advertising, something of a startling character may be worth a fortune. Sky-signs are properly doomed, so instead of looking aloft to acquaint ourselves as to the merits of rival soap-makers, we are still content to take a lower level. To make an advertisement successful, it must, of course, be more or less of a permanent character, hence the utilisation of our roadside hedges, and the adaptation of hoar-frost has, perhaps, never suggested themselves to those whose wits for novelty in this line must often be sorely taxed. It is not that we wish to see our rural lanes or respectable suburban roads defaced by the advertising demon; indeed, if we thought it were possible for it to be taken up as a real system of advertising, we should not make known what we saw during the past winter on a well-clipped Holly hedge not a hundred miles from Kew Gardens. At the time we refer to, a hoar frost had prevailed for a day or two, so that the entire hedge was beautifully coated with a delicate setting of frosted silver, upon which some one had written very carefully, and in well-formed letters, extending the whole length of the hedge, the

title of a recently-published work, of which a resident in the neighbourhood was the author. Fortunately this kind of advertising is of a very evanescent character, the first rays of sunshine obliterating the whole; but yet the idea was novel, and illustrated how the most beautiful productions of Nature can be twisted to trade purposes.

Sunshine and Drought in March.—For the last five weeks the daily amount of bright sunshine over the greater part of our midland and eastern counties varied from seven and a half to seven and three-quarter hours, the proportion of its possible amount being in nearly all cases over 60 per cent. At the south-coast stations, the mean daily amount was about an hour greater than in the inland districts, the percentage for the five weeks being over 70, and in some places as high as 72 to 73. The rainfall for the same long period has been extremely small, the aggregate amount measured over the eastern, central, and southern parts of England being, in most instances, less than one-tenth of an inch, and in some few places less than half-a-tenth. In the western and northern parts of the Midlands, a few slight showers were experienced at the commencement of the present month, but with this exception, no rain has fallen over our eastern, midland, or southern counties since the middle of March. Unless a change in the weather sets in very shortly, it is quite certain that the present drought will rank as one of the most remarkable on record.

The Rose Show at the People's Palace.—Preparations are being made for a great Rose and flower show at the People's Palace on July 13, 14, and 15 next. It is intended to include Hackney in the scheme, and a committee is being formed to carry out the project, prominent workers on this body being the Marquis of Lorne and Sir Charles Fremantle. A novel attraction will be a representation of a battle of flowers, which is being arranged by Mr. Harold Bolton, Mr. Ernest Flowers, and other well-known West End gentlemen. The schedules and prize-list may be obtained on application to Mr. C. E. Osborne, the Secretary of the Palace.

Coals to Newcastle.—It does seem odd that we should very largely export American plants to America. The matter has for us some horticultural as well as some trade interest, for whilst it is gratifying to our professional pride to find that we can grow Rhododendrons so admirably here, as to evoke not only the admiration but also the custom of our transatlantic brethren. It is also interesting to learn that home trade is receiving impetus from remote countries, of which those narrow-minded souls who are always worrying over our immense food importations have little knowledge. A very interesting incident is told relating to the despatch of a somewhat extensive consignment of Rhododendrons to America by the well-known Hampshire nurseryman, Mr. W. H. Rogers of Southampton. Hitherto, it has been found needful to send all similar plant consignments to New York *viâ* Liverpool, and at great cost. They had to be despatched some three or four days before the sailing of the steamer from that port. But the transfer of some of the former Inman Line fleet to the American flag, and to Southampton as their British port of call, literally brought the means of transit to Mr. Rogers' own door. So that when, very recently, he had to despatch a consignment of 5000 Rhododendrons to Flushing, New York, it was quite easy work for the entire stock to

Fig. 67.—Oreopanax sanderianum. (see p. 442.)

be lifted one day, put on board by the nurseryman's own men and vans the next, for Mr. Rogers is but 3 miles from the dock side, and within a week the plants are delivered to the purchaser in the finest possible condition. This is a fact that has some concern for the London nursery trade as well, for Southampton is but two hours distant. Wagons run by the vessel's side direct, and the transit from nursery to ship may be effected in a remarkably short space of time. One very important element in the Southampton traffic is, that steamers of the heaviest burthen may leave the port at any hour. That, horticulturally, such trade facilities as are thus indicated are of the highest importance, there can be no doubt, indeed they serve to show that behind them may be great possibilities.

Prolific Apricot.—Mr. Tuff, of Lewes, sends us a photograph of an Apricot tree, 20 feet by 15 feet, growing on a south wall. The tree is shown as full of flower. Last year half a bushel of green fruits were picked for thinning, and more than 600 fruits were allowed to ripen. It looks as if the crop would be equally heavy this year.

Dundee Horticultural Association.—The monthly meeting of this society was held on Friday evening in the rooms of the Y.M.C.A., the Chair being occupied by Mr. Wilkie, the President. In the absence of Mr. M'Hattie, Newbattle Abbey, who intended giving a paper on "The Cultivation of the Chrysanthemum," the Hon. President, Mr. Alexander Hutton, gave an account of the flora of Ceylon, and the physical characteristics of that island. In concluding, Mr. Hutton gave an account of the botanic gardens of Ceylon. Among the exhibits were a large and beautiful collection of named Narcissi, sent by Mr. James Wood, Priorwood, Melrose; also a finely-flowered specimen of Chrysanthemum W. G. Drover, grown by Mr. Kennedy, Arddarroch.

M. Daveau.—This gentleman, who till lately was the Inspector of the Botanic Garden at Lisbon, has been appointed head gardener at the Botanic Garden, Montpellier. M. Cayeux has been nominated as his successor at Lisbon.

Fruit from Australia.—A consignment of fruit from Victoria was, says the *Daily News* of April 12, opened yesterday morning in the Potato Market, Covent Garden, and was found to consist of Plums, Grapes, Pears, Tomatos, and Apples. The Apples, magnificent in size, form, and colour, had travelled splendidly, and found a ready sale at a good price. The softer fruits had not fared so well, many of the Pears having lost their firmness, while few of the Plums had retained their freshness. Some of the Grapes, both Sultana and little Currant Grapes, were fresh with the bloom on them, but some of the contents of the boxes were quite soft and discoloured. It was pointed out by experts present that great care is needed in choosing the kinds of fruit for transport in the first instance, certain sorts travelling extremely well, while others will not stand any knocking about. Among the Pears sent were some Williams', which are notably transitory. Summer Pears do not keep as a rule, and those which were sent by the Department of Agriculture, Melbourne, though splendid fruit and of great size, were of course gathered in the height of the Antipodean summer. Even in these disadvantageous circumstances, however, many of them were in good condition, and, on the whole, the experiment is by no means unhopeful. The Tomatos were pronounced to be first-rate in quality by a well-known authority in Covent Garden market, and of these about a third were sound and fresh. Experience in selection is needed, and also in packing the fruit. The Apples showed an exquisite bloom, almost like that on an Apricot, and the flavour and odour were excellent. These were packed in cylinders of corrugated brown paper, and were none the worse for the long voyage. The fruit left Melbourne on February 25, having been placed in the cooling chambers of the ss, *Britannia* on the previous day. It was, therefore, six weeks on the way. It is hoped eventually to open up a market with London equal to that of Tasmania, which has done a fine trade in Apples with the mother country during the last two or three years.

Proposed Narcissus Show at Birmingham.—An exhibition of Narcissi will take place at the Edgbaston Botanical Gardens, Birmingham, on April 26 and 27, and as liberal prizes are offered for the various sections, a good display is hoped for. Blooms of new varieties are particularly invited, and experts in Narcissus culture and knowledge are engaged as judges.

Richardia æthiopica.—Mr. Sheppard, of the Toddington Orchard Company, sends us a double-spathed Arum, which is sufficiently common, but in Mr. Sheppard's specimen there is also a supplementary spadix springing from the axil of the lower spathe. The original flower-stalk, as well as bearing a spathe and spadix as usual, has produced a secondary one at a lower level. If this peculiarity could be perpetuated, we should have a succession of bloom from the same stalk.

Publications Received.—*Nova Scotia Provincial Government Crop Report*, December, 1892.—*Practical Gardening*, a series of essays read at the Devon and Exeter Gardeners' Mutual Improvement Association.—*The Nine Circles.*—*The Wild Rabbit* (W. Blackwood & Sons).—*Onions for Profit*, by T. Greiner.—*Celery for Profit*, by T. Greiner.—*Manures: How to Make and How to Use them* (W. Allee Burpee & Co., Philadelphia).—*An Essay on the Pleasures of a Garden*, by Joseph Addison, Esq. (Hatchards, 187, Piccadilly).—*Weather Predictions*, No. 2, by Hugh Clements.—*The Genus Masdevallia*, Part IV., issued by the Marquis of Lothian; plates and descriptions by Miss Florence H. Woolward.

Home Correspondence.

Strawberry, John Ruskin.—My experience of the above is much the same as that of your correspondent, "R C.," a miserable failure. I grew 100 plants side by side with La Grosse Sucrée and Keen's Seedling in two batches. The last two named varieties did well, and I commenced to pick good fruit on February 21; but altogether I did not gather a dozen fruits from John Ruskin, although the plants were strong, flowered freely, and looked in every way promising; moreover, care was taken to fertilise the blooms, but all to no purpose, and I have consigned the whole lot of J. Ruskin to the rubbish heap. Before reading "R. C.'s" note, I was under the impression that I could not have grown the true variety. I shall be anxious to learn how the variety has behaved with others who may have given it a trial. *Edwin Beckett, Elstree.*

—— I fully concur with what "R. C." said at p. 422 about John Ruskin as an early forcing Strawberry. Its constant susceptibility to attacks of mildew will prevent my using it again for forcing. Fortunately, this serious fault of the variety was noticed in the autumn, and I was on the look-out for its re-appearance when the plants were forced. Mildew soon showed itself, and the plants were forthwith isolated and placed on shelves in a small forcing-house apart, otherwise the mould would have been spread amongst a large healthy stock of La Grosse Sucrée, Noble, and President. The fruits of John Ruskin were poor, small, flabby, and insipid, and nearly white with the mildew, in spite of the usual remedies for mildew as far as circumstances would allow being applied. On the other hand, La Grosse Sucrée again proved itself to be the best early forcing Strawberry extant, possessing every good quality found in early forced Strawberries. I do not happen to know the parentage of John Ruskin, but should imagine it to have descended from our old but mildewy friend, Black Prince. I shall in future grow John Ruskin and Noble for furnishing early fruit out-of-doors. If the earliest-formed runners of the last two are well grown, and planted in a good position, nearly a fortnight will be gained over old plants of the same kinds in the open quarter. Indoors it is no earlier than La Grosse Sucrée and Vicomtesse H. de Thury. I never can get it on stalks long enough to be out of the way of manure water. *W. Crump, Madresfield.*

[Our correspondents, Mr. T. Denny, gardener, Down House, Blandford, and Mr. J. Fry, gardener, at Haydon Hall, Eastcote, speak in almost identical terms of condemnation of the variety as a forcing Strawberry, and of praise of La Grosse Sucrée, Vicomtesse H. du Thury, and Auguste Nicaise, as excellent early-forcing varieties. Ed.]

—— This variety is doing well with us. About fifty runners were put into 4½-inch pots late last summer, and being weak, were forced in them, they have given a good crop of fruit which is now ripe. The plants were started the first week in January, and have been brought on gradually. Outside, John Ruskin is equally promising, and almost every plant is showing a strong truss of bloom, although it was somewhat late when they were planted, and the plants weak. So well does this variety augur for forcing, and so prolific is it in small pots, that I will try no others for early work. "R. C." is quite correct in stating that it is subject to mildew, ours were getting bad, but three syringings with Stott's Killmright quickly annihilated it. *W. J. S., Sedgwick, Westmoreland.*

Lapagerias.—In the list of stove and greenhouse climbers given by Mr. Latham, curator of the Edgbaston Botanical Gardens, on the occasion of a paper read by him at a recent meeting of the Birmingham Gardeners' Association, he referred to the first plant of Lapageria alba which was received at the Jardin des Plantes, Paris, in the year 1843. It had been dug up in Japan [?] with a square solid hard block of clayey soil, really like a block of stone, and nearly as hard, 4 feet square and 4 feet deep, and was sent to Paris by the missionaries from Chili or Patagonia. It was planted in this state, but made very little growth, the roots having been cut away in getting it up, and remained so until 1857, when Mr. Latham was an employé in the Jardin des Plantes, the roots having been in the same condition fourteen years. It grew from the old growths only, which were very weak, never throwing up any root shoots, and the plant ultimately died. This state of the plant evidently lead Mr. Latham to study the Lapageria, for its cultivation by him at the Birmingham Botanical Gardens is productive of luxuriant growth, there being fine examples of the white and red varieties in the Palm-house. Other specimens planted out in the large glass hall in narrow borders, 15 inches wide, and 18 inches deep, in loam, peat, and sand, and trained up to the roof, now cover a very large space, and flower profusely, and are fed liberally during the growing season, but the Lapageria is impatient of water until the pots or tubs are filled with roots; and good drainage is essential. *W. D.*

Potatos.—Yet another book on the Potato. What with all that has been written in books and in the horticultural press, the Potato has been pretty well pumped-out, in a literary sense, though happily it is wonderfully lively and in evidence physically, and for all that, I think we have very little to thank the books. These lucubrations have very largely dealt with what was at one time a very attractive subject the exhibition of Potatos, and if less so now, it still has many admirers. The whole subject of culture in every possible aspect has been flogged out over and over again, and little if anything that is new remains to be said. Even the very attractive work of raising new varieties, now hardly elicits enthusiasm, for the simple reason that for several years we have had in ordinary cultivation scores of splendid varieties that it will be most difficult to excel, and will be as good twenty years hence as to-day, if the stocks be carefully and intelligently cared for. The new book tells us that varieties of Potatos soon wear out. That is an excellent booming phrase, when new ones have to be sold. We have not yet exhausted the Ashleaf Kidney, or the Lapstone where it is grown, and but for the disease, the Regent and Victoria would be as good to-day as ever. The Schoolmaster shows no signs of giving out, and many others of the older kinds are as good, especially where they find suitable soils. It is not because Potatos have inherent weaknesses that they have, in so many cases, passed out of cultivation. Their disappearance has been chiefly due to the action of the disease, which attacks weak and strong varieties alike, denuding them of leaves and stalks mercilessly, but halts at the tubers of certain sorts, and the exigencies of the case have compelled us to forego growing the soft-flesh varie-

ties for the sake of the disease-resisting powers of the others. But for the disease, we might have had popular varieties of fifty years ago still in common cultivation. However, the raising of new varieties still proceeds, and if no one grows rich over it, no one is the poorer. *A. D.*

PETROLEUM AND INSECTS.—During two or three weeks, recently, I have followed your correspondents' remarks in regard to using petroleum as an insecticide, and as an amateur florist I have experimented with the mixture so often mentioned—a wineglass of parafin and two of soft-soap to 1 gallon of water, mixed thoroughly with a syringe, say, for each draw sprayed on the plant, the alternate one sent back into the can; by this means the mixture has been thoroughly incorporated, and in most cases I have found it harmless to the tenderest plants, whilst in other instances it has killed everything it has come in contact with. So the conclusion I have arrived at, after experimenting, as I said previously, for about thirty years is, that petroleum-oil for burning may differ but little in each purchase, but for horticultural purposes it varies so much, that sooner or later it means disaster to anything it is used upon that is in the least tender. I quite agree with your correspondent that, even Vines, in a dormant state, cannot recover vitality beyond the point where it had come in contact with them. If it could be relied upon that each fresh supply be the same, it would prove to be one of the cheapest mixtures that can be used; but, finding it not to be trustworthy, in case of death to valuable specimens, I think it will prove to be penny wise and pound foolish. With a little digression, I say to amateurs and gardeners, fertilisers are equally disastrous to plant-life; used judiciously, nothing can be better; used in excess of the natural food of the plant, they are foes instead of friends. I speak principally of sulphate of ammonia, nitrate of soda, and nitrate of potash; on the other hand, say, superphosphates and sulphate of lime, even for all crops, used in excess, do no harm—it is simply a waste of money using them beyond the requirements of the soil. By a judicious use of these compounds, crops can be increased more than one hundredfold, and injudicious use means exactly the same, both in insecticides and fertilisers, as when a physician tells you to take three times a day a tea-spoonful of medicine, which will put you right, and you go on the principle that, if that quantity will put you right in a week, a wine-glassful will do the same in a couple of days. The result, both with the plants and yourself, may be equally disastrous. *S. H. Trott.*

TREES IN TOWNS.—When recently at Shepherd's Bush, my attention was drawn, in a genteel street, some 30 feet wide between the kerbs, to a large number of Sycamore trees, planted about 16 feet apart on either side. These had been planted some twenty years, and when I saw them had undergone the customary winter lopping, for that seems to be an absolute necessity. Were not the trees thus hard lopped, they would soon render residence in the street intolerable. Yet the houses have fairly deep forecourts, in which other trees had been planted, so that the putting of these Sycamore trees in the street was a superfluity, necessitating on the part of the residents much endurance of most unsightly objects, for uglier things than these heads presented for five months of the year could hardly be conceived. Well, that is just what has to be endured in hundreds of the narrow streets of the metropolis, which never were intended for trees, or fitted to possess them, because so narrow. Young trees, so far as the heads are concerned, are unobjectionable, but the streets are invariably defiled by the ugly objects called guards, generally made of stout wood, and hideous beyond conception. But apart from these things, I had authority to state, as avouched for by a leading medical man, that these dense-headed trees, when in leafage, were productive of evil to the public health, because they become strongly impregnated with sewer gases and other obnoxious elements with which town atmospheres abound [! !]. This is a very serious charge to make against town trees, and merits the closest inquiry. I do not know whether it is an evil chargeable more to the Sycamore than to any other tree. No street should contain trees, except those 50 feet between the kerbs, and then in the form of a single row down the centre, with seats beneath, and 5-feet footpaths on either side, to make a pleasing promenade. *A. D.*

STREPTOCARPUS AND REHMANNIA HYBRID.—In looking over some of the back numbers of the *Gardeners' Chronicle*, I find an article relating to the possible production of a bi-generic hybrid between Streptocarpus and Gloxinia. I thought it of interest to mention the possibility of a Strepto-Rehmannia, the seedlings of which are just showing the second leaf—this is on some plants of quite a round shape, gradually lengthening. I crossed Streptocarpus Rexii with Rehmannia chinensis in August last, and we received good and well-developed pods, which appeared to be shorter than the ordinary ones of S. Rexii. In crossing Rehmannia with Streptocarpus, no seeds were obtained. Although Rehmannia is a member of the Scrophulariaceæ, it has great similarities to Gesneraceous plants, of which Nat. Ord., if I am not mistaken, it was once considered a member. We may entertain the hope of an addition to our rockeries. *E. B. B., Botanic Garden, Cambridge.*

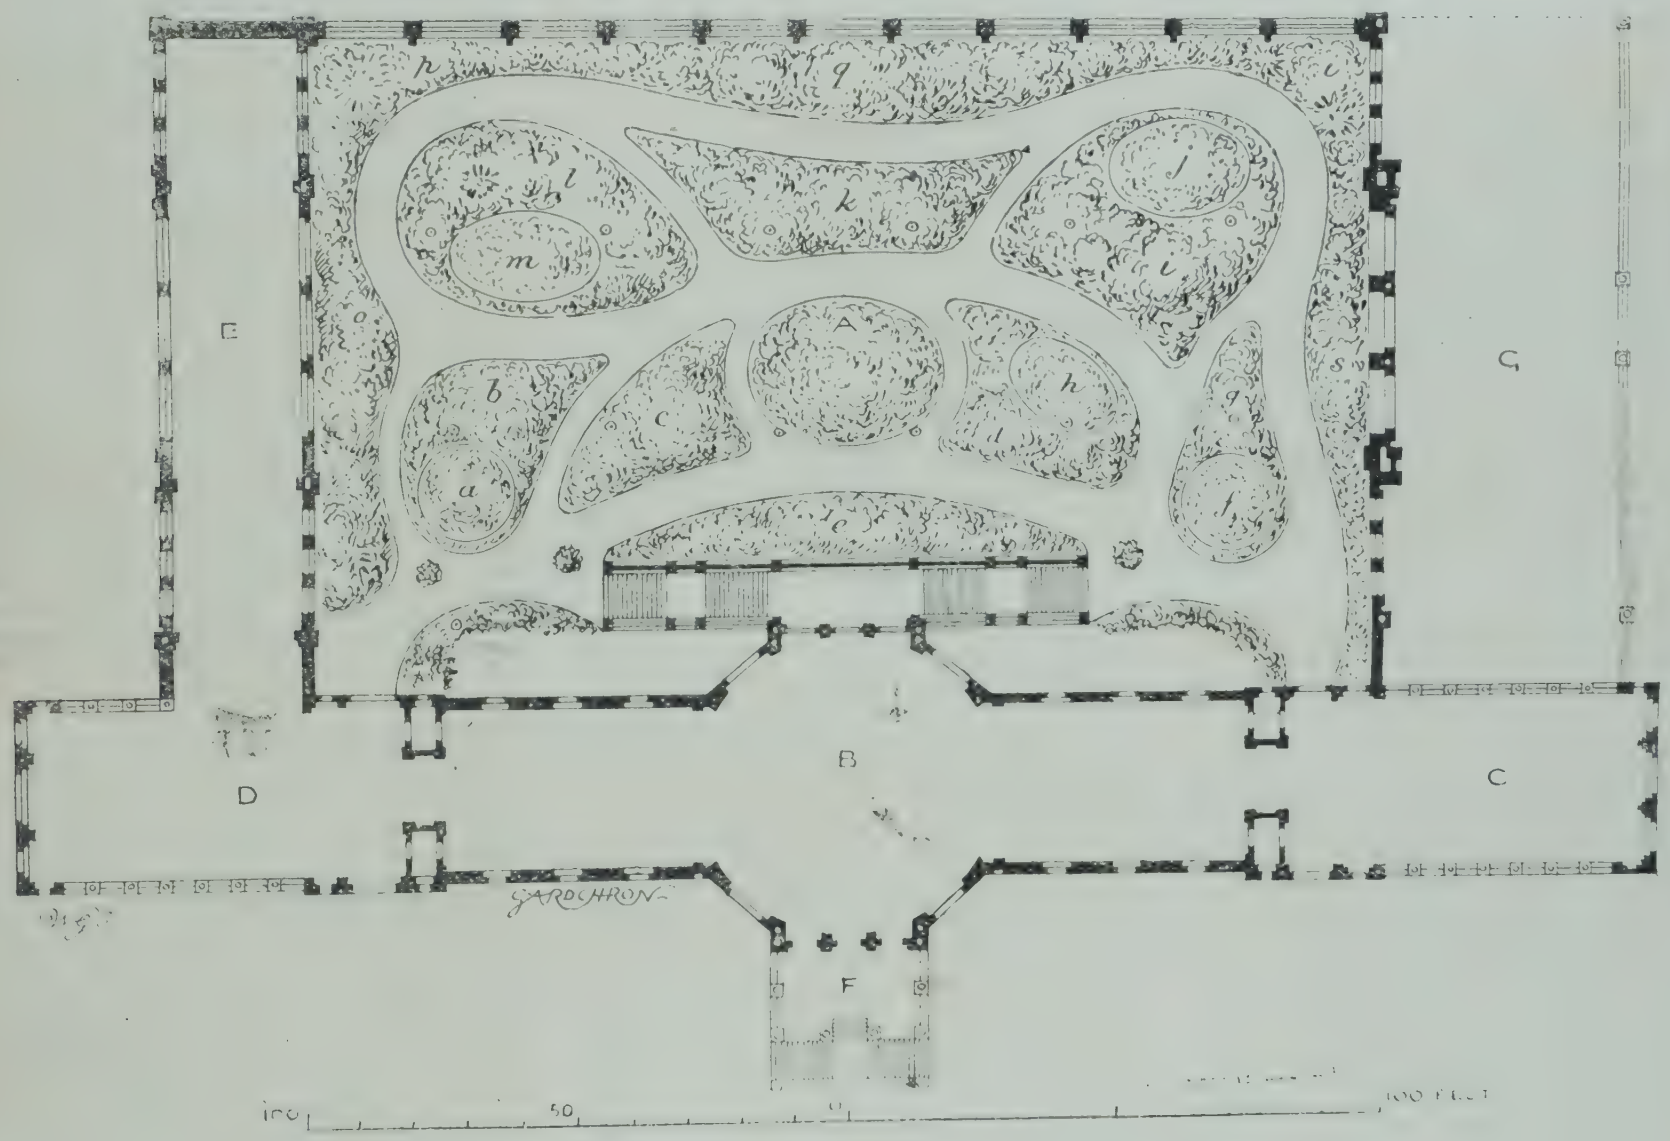

FIG. 68.—GHENT EXHIBITION: PLAN OF THE GREAT HALL, ETC. (SEE P. 442)

THE WEATHER LAST MONTH.—March has been a remarkable month in many ways from a meteorological view. The total rainfall here has only been 0·24 inch, which is 1·21 inches below the average. Rain was only recorded on seven days, and the last fourteen days of the month were quite dry. We had a small quantity of snow on the 16th and 17th. For seven consecutive days (19th to 25th) the sky was quite clear, and not a cloud was seen during the whole time. The highest shade temperature during the month was 67° on the 30th, lowest 20° on the 19th;

lowest on grass 13° on 19th and 29th; mean temperature of the month 45 19°. Frost was registered on 18 days, but owing to the great amount of sunshine and the dry weather very little damage has has been done by it, but it has to some extent subdued the excitability of vegetation which was caused by the abnormal amount of warmth and sunshine. Among hardy spring flowers, the blossoms of Anemone fulgens, Primula rosea, P. denticulata, P. polyanthus, and Ribes sanguineum have suffered severely. Narcissus, consisting of many varieties, have escaped unhurt on a south border. The prospects of fruit in this neighbourhood are abundant, and nothing is far enough advanced in the open to be injured by frost at present. Peaches and Apricots on south walls protected with double fish-nets have set well, but a few of the most prominent flowers have fallen off. The ground is now getting very dry and hard, and unfavourable for small plants and seeds. Herbaceous plants divided and replanted a month ago, have had to be watered to keep them alive. On the farms there is no growth observable in the grass, and the heavy soils cannot be sown before rain comes. *W. H. Divers, Ketton Hall Gardens, Stamford.*

DOUBLE-FLOWERING THORNS FOR CONSERVATORY DECORATION.—I believe it is an unusual thing to see the double-flowering Thorns used for the embellishment of the conservatory. Standards of 5 or 6 feet in height, with proportionate heads, are very suitable for placing in conservatories where the arrangements on the ground are after the winter-garden style. Stood amongst Palms and other ornamental plants as a background to groups, they greatly relieve the monotony. I saw them thus used with good effect in the middle of March last; they were then in full leaf and blossom, and had been forced in exactly the same way the previous year, and had remained in the same pots all last summer and winter, plunged in ashes to the rims. They seemed in no way to have deteriorated, for they were bearing an abundance of their double white, scarlet, and pink flowers, and the foliage as abundant and healthy as when in the open air. The plants were placed in the same conservatory about five weeks previous to my seeing them, and had been subject to a temperature ranging from 50° to 60°. I consider them valuable additions to the floral display at this early season of the year, even in the most favoured parts of the kingdom. The May blossom is not seen until five or six weeks later than March 20. *F. S.*

SCARLET RUNNERS PRESERVED.—During the season of French Beans, one is almost sure to have more than can be used, and yet there is nothing like keeping them gathered close to prolong their bearing. Last summer I got a quantity of common jars glazed inside, and during the summer and autumn kept gathering our surplus Beans, slicing the Beans into three. A layer of Beans was placed in the jar, and a layer of salt, and this was continued till the jar was filled. No water was added, as they make their own brine, and keep splendidly. They are most useful during the winter months, and are highly valued at the table when vegetables in variety are scarce. I ought to mention that they are better soaked in spring water for a few hours previously to cooking them, otherwise they may be too salt. *J. Rust, Eridge Castle.*

HYBRID NARCISSUS "SNOWDROP."—This fine flower, of which you gave an illustration in your last number (fig. 62), is the outcome of a cross between N. cernuus ♀ and N. triandrus ♂. It affords a noteworthy illustration of the added vigour sometimes obtained by cross-fertilisation. The hybrids between trumpet Daffodils and N. triandrus, such as the wild Portuguese forms, known as varieties of N. Johnstoni, and several artificially produced in my own garden, have hitherto been strictly intermediate in size between the two parents. But the flower shown at fig. 62 is as large as, if not larger than the finest examples of N. cernuus, and possesses great stoutness of substance. The uniform whiteness of both corona and perianth, and its drooping Fuchsia-like habit, give to this flower a very remarkable and attractive character. *G. H. Engleheart, Appleshaw, Andover.*

VENIDIUM CALENDULOIDES.—Although but very little grown, this is a summer-flowering plant of surprising beauty. If used for bedding purposes, it forms a delighful change from the conventional Calceolaria. We raise the plants of this from seed in the same manner as the Poppy. I find it more satisfactory to treat it as an annual, for the simple reason that a packet of seed takes up far less space all the winter than a batch of cuttings would. When I first started growing this Venidium, I made the mistake of sowing the seed in too rich soil, and many of the seedlings used to go off. Then I tried sowing in the refuse from the potting-bench, and planting in the poorest soil obtainable, and that proved the better way. The flowers are orange and lemon-coloured, with a black disc or centre. Seen in flower with the sun shining upon them, it is acknowledged by all to be a most glorious sight. *R. Weller.*

ROSE JAUNE DESPREZ.—What an apparent upraising from the dead past is reference to Jaune Desprez as made by "A. Y. E." Forty-three years ago it was classed as a Noisette, but Teas in those days had hardly become a distinct section, and Jaune might have been a progenitor of Gloire de Dijon, Madame Bérard, and other strong-growing buff-coloured forms. Jaune Desprez was in those days regarded as a strong grower, and worked as standards used to produce very wild heads, not flowering very profusely, whilst at that time with it our best Noisettes were Annie Vipert, Lamarque, &c.; our best Bourbons were Souvenir de la Malmaison, still the best; Coupe d'Hébé, Madame Desprez; and of H.P.'s, Jules Margottin, Géant des Batailles, and General Jacqueminot. We have gone ahead in Rose production since 1850. *A. D.*

SINGLE CHRYSANTHEMUMS.—I agree with "A. D.," p. 364, that single Chrysanthemums are not grown nearly so much as their merits deserve where flowers for decorative use in large quantities are required. But I think it is a mistake to spend time and space in cultivating seedlings for the purpose of obtaining flowers when such a number of varieties can be had which embrace all forms and colours needful to satisfy the most fastidious in either respect. From "A. D.'s" note, two years is required to test these seedlings; whereas if cuttings of selected kinds were employed, no doubt need be experienced as to the results when flowering the first year. Of course, the raising of seedlings by those who have a financial interest in them is another matter, but for the ordinary cultivator, who requires a lot of flowers, and has but little space at command, the advice to grow seedlings is not of the best. No section that I am acquainted with is so interesting as this, and certainly none that can please by its perfume like this. One or two plants of Mrs. Langtry, for instance, will scent a whole house when allowed to perfect all its blossoms. It is in this way that single Chrysanthemums are so interesting as compared with the plants grown to give a restricted number of larger blooms. *E. M.*

NEW APPLES.—It would be well if all who have, or think they have, new or distinct Apples not in commerce, would send samples of them to the Drill Hall for the judgment of the Fruit Committee, rather than merely write about them, and keep the samples in their fruit rooms. The most careful consideration is shown by the Committee to all such exhibits, and they are fairly tested and judged by a perfectly competent and impartial body. Cannot "East Somerset" send up some of his Royal Somerset also, as you advise Mr. Doe some of his Beauty of Stoke. I notice that, whilst one correspondent writes of this Apple as an early culinary variety, another refers to it as a reputed good keeper. It is in the latter section that we have most room for novelties, for of early culinary sorts we have legion, and new ones must be wonders to be improvements. *A. D.*

THE TRIMMING OF CONIFERS AND FLOWERING SHRUBS.—The following remarks were suggested by the writer recently observing a jobbing gardener ruthlessly cutting away quantities of flowering branches and shoots on some shrubs, &c., in a shrubbery. There is such a great number of kinds of flowering shrubs and Conifers, and their habits of growth, and the sorts of pruning they require are so varied, that a workman should possess considerable experience of a special character before being entrusted with this kind of work. As a general rule, only the knife should be used on Conifers and shrubs—never the shears, unless it be on a hedge, say of Sweetbriar, Pyrus japonica, Clematis flammula, Holly, Box, Yew, or Arbor-vitæ. The present season is suitable for performing the operation of pruning either with knife or shears, the young growth soon hiding the cuts, and relieving the stiffness caused by the pruning. Retinosporas, Cupressus, Thujas, &c., should always be trimmed with a knife, which should be used very sparingly, or the characteristics of most will be marred. We do not want specimen trees to grow into perfectly symmetrical as into pleasing forms. In pruning Conifers, small branches should be removed entirely, and rival leaders reduced to one, and if the few branches near the top are very strong, the tips of these should be cut off once only. Turning to the flowering shrubs, I have frequently seen the long and well-matured shoots of Weigelas shortened back to about a foot, under the impression perhaps that such strong wood was of little value, and gave the plant a lop-sided appearance, and robbed the weaker shoots of their share of sap. Weigelas, Deutzias, Prunus, Ribes, Guelders Roses and other, Viburnums, Cratægus, and Pyrus, bloom the finest on those shoots that grew away strongly the previous summer; and any pruning that may be necessary to keep the plants within bounds should aim at the removal, as much as possible, of old flowerless wood, and the weaker of the growths of the previous year. Flowering shrubs such as these are to be pruned like strong-growing Roses, which make good wood one season that flowers the next. To my mind, Conifers and flowering shrubs are never seen to better advantage than when placed on the outskirts of a lawn, and judiciously contrasted, Thorns, Weigelas, Laburnums, &c., having fine effects when so planted. But to get the best effects, the knife should be used sparingly and judiciously. *A. P.*

PAPAVER UMBROSUM.—This useful and beautiful Poppy, makes a charming bed in the flower garden. It does best for bedding out, if the seed is sown in small pots during the early part of March; any ordinary soil, if finely sifted, will suit them well. Place the pots in any warm house, such as a vinery, or Peach-house at work, until the seedlings appear, when they should be placed on a shelf as close to the glass as possible. Thinning will be necessary as the seedlings can be handled; it is advisable to do this several times, in preference to one hard thinning, until eventually there is but one strong plant in each pot. When thoroughly established after thinning, gradually inure the plants to more air, and finally plant them out in the first week in May. Slugs have a peculiar fancy for this Poppy, and close watch must be kept over them in the early stages of growth. If the seed vessels are cut off every few days, there is no difficulty in getting it to flower until frosts set in. *R. Weller.*

SOCIETIES.

ROYAL HORTICULTURAL.

April 11.—The hall was again full of plants and flowers in season. There was a good array of Daffodils, and during the day it was noticeable that an unusual number of lovers of these flowers were included amongst the members present. Although the attendance was good, the extraordinary change in the weather that brought about one of the coldest of east winds, was responsible for the absence of many who would otherwise have been present.

Floral Committee.

Present: W. Marshall, in the chair; and Messrs. H. B. May, H. Herbst, R. Dean, C. T. Bause, J. Jennings, R. B. Lowe, W. C. Leach, C. Jeffries, W. Bain, G. Gordon, C. E. Shea, H. H. D'Ombrain, J. D. Pawle, C. Noble, C. E. Pearson, T. Baines, J. Fraser, H. Turner, Ed. Mawley, and G. Paul.

Miscellaneous groups were numerous and good. A very pretty collection of New Holland and other plants was staged by Messrs. Hugh Low & Co., Clapton, and Bush Hill Park Nursery, Enfield, and included a batch of Genista Andreana, Erica in variety, Boronia, Eriostemon, Azaleas, &c. (Silver-gilt Medal).

Messrs. William Cutbush & Son, Highgate, London, N., had an equally interesting group. They showed first-class plants of Erica Spenceriana, E. Cavendishii; also Leschenaultia biloba major, a group of Calla Little Gem, some Doronicum caucasicum in pots, some Tree Pæonies, and a plant or two of Clianthus magnifica (Silver Flora Medal).

A group of a different kind was shown by Messrs. Jno. Laing & Sons, Forest Hill, S.E. There were some good Cliveias here, Azaleas, Tree Pæonies, Dracænas, Cymbidiums, Lilacs, &c. (Silver-gilt Medal).

Messrs. B. S. Williams & Son's group included some of the Amaryllis noticed in these pages last week; also some equally good Cliveias, Anthurium Siberzerianum semi-plena, A. Dickii ×, A. Devansayanum, &c. (Silver Flora Medal).

Messrs. Jas. Veitch & Sons had sprays of flowering shrubs from their establishment at Combe Wood. There were Cydonia japonica, C. Maulei, C. j. alba, C. j. atro-purpurea, and C. j. rosea; also Andromeda speciosa cassinifolia, Cerasus Watererii, Olearia Gunni, &c. (Silver Banksian Medal).

Messrs. H. Lane & Son, The Nurseries, Berkhamstead, staged a number of Polyantha Roses in the different colours; also several plants of a Ghent Azalea, named Anthony Koster. The plants were literally hid by large trusses of handsome blooms of yellow, shaded with orange. This was awarded a First-class Certificate, and the group a Silver Banksian Medal.

Messrs. Paul & Son, Cheshunt, had a group of standard Genistas, Alpines, &c. A fine Canna Progressive included in the group, obtained an Award of Merit; its petals are wide, the ground colour is of primrose, beautifully mottled with scarlet; another one, called Primrose, describes its own colour (Silver Floral Medal).

A collection of alpines, tastefully arranged in three large baskets, was from the Guildford Hardy Plant Nursery, Millmead, Guildford. There were Primula rosea var. grandiflora, P. ciliata var. purpurea, P. elatior cœrulea, Ranunculus amplexicaulis, Polygala chamæbuxus purpurea, Gentianas acaulis and excisa, and many others (Silver Flora Medal).

Mr. Frank Cant of Colchester obtained a Silver Flora Medal for one of the finest collections of cut Roses we remember seeing at this early date. There were perhaps fifty varieties, the most noticeable of which were Baroness Rothschild, Pride of Waltham, Crown Prince, Duke of Edinburgh, Suzanne-Marie Rodocanachi, Vicountess Folkestone, Her Majesty, Mrs. John Laing, &c.

A group of pot-Roses, some Ghent Azaleas, Spiræas, &c., from J. C. Taker, Esq., Middleton Hall, Brentwood, Essex (gr., J. Perry), was awarded a Silver Flora Medal.

Mr. Geo. May, market grower, of Upper Teddington, brought a group of Clove Carnation, Uriah Pike, a fine free-blooming dark crimson variety. A Silver Banksian Medal was awarded, and also an Award of Merit for the variety.

Messrs. E. D. Shuttleworth & Co., Limited, Peckham Rye, London, S.E., showed a good group of Cycads, most of them in 7-inch and 8-inch pots (Bronze Banksian Medal).

Sarracenia Mandaiana=S. flava rubra× S. Drummondi was shown by Messrs. Pitcher & Manda and was awarded a First-class Certificate.

A large collection of cut bunches of Wallflowers, in the different colours, came from Messrs. H. Cannell & Sons, Swanley (Vote of Thanks); also a basket of nice blooms of the Harbinger Primrose.

Mr. E. Morse, The Nurseries, Epsom, had a group of Lily of the Valley in pots, described as Forten's variety. The foliage, perhaps from cultivation, was larger and more developed than usually seen, but the blooms had nothing particular to recommend them.

A miscellaneous group from Messrs. John Peed & Sons, Roupell Park Nurseries, Norwood, consisted of Dracænas, Ericas, Anthuriums, Palms, &c. (Bronze Banksian Medal).

Seedling forms of Malmaison Carnation were from R. Smith, Esq., Hayes Common, Beckenham (gr., C. Blick). One called Princess May, of dark yet soft scarlet, rather loose thin flowers, which, however, will possibly improve, gained an Award of Merit. Another one, a pink variety, was called Sir Evelyn Wood.

A First-class Certificate was awarded to Bougainvillea spectabilis, exhibited by Captain Oldfield, South Warnborough Lodge, Winchfield, Hants (gr., G. Southcott). This species is a very much better colour than the well-known B. glabra, but has been generally found far less free in blooming.

Mr. A. Waterer, Knap Hill Nursery, gained an Award of Merit for Pyrus japonica var. cardinalis. This is a magnificent variety; the blossoms are extra large, and of a deep, striking scarlet.

J. T. Bennett Poe, Esq., 29, Ashley Place, S.W., showed a bloom of Richardia aurata Deleuil, obtained from a cross between R. albo-maculata and R. hastata; the leaf is as large as that of the ordinary æthiopica, and has white spots; the bloom, also, which is of a good size, is of pale primrose, with dark blotch at base. Some varietal blooms of Gentiana acaulis were sent by G. F. Wilson, Esq., Weybridge. A good grey-edged Auricula, named Marmion, was from Mr. J. Douglas, Great Gearies, Ilford (Vote of Thanks).

Messrs. Hugh Low & Co., Clapton, staged a hybrid Eucharis, which they call E. Lowii. It is about midway between E. grandiflora and E. Sanderiana, and is supposed to be the result of a natural cross between those two species. It was imported amongst some bulbs of E. Sanderiana (Award of Merit). Mr. W. C. Leach, gr. to the Duke of Northumberland, Albury Park, Guildford, had sprays of Salvia Gesneriflora and Philadelphus coronarius grandiflorus, to exhibit its superiority over the type.

Narcissi, &c.—This meeting was the Narcissus feast of the year, and we are not likely to see these beautiful flowers in finer condition this season.

Very fine in size, and pure in their tints, were those shown by Messrs. Shuttleworth & Co., Peckham Rye and Fleet, Hants, whose collection, if not a large one, contained a number of choice varieties. The more noticeable were N. Burbidgei, white perianth and orange crown; N. poeticus poetarum, N. incomparabilis Cynosure, with long perianth segments of light yellow colour, and a corona of a deeper shade, and three-quarters of an inch deep; L. i. Sulphureus flore-pleno, a nice flower, of delicate shades; N. Johnstoni, Queen of Spain, pretty; N. bicolor, N. b. Horsfieldi, N. cernuus, &c. The other constituents of the group consisted of Primula acaulis, P. polyanthus, Heuchera sanguinea, Ranunculus amplexicaulis, Onosma albo-rosea, a plant with soft-felted foliage 1½ inch long, and terminal panicles of whitish tubular blossoms (Bronze Banksian Medal).

A large refined collection of Narcissus was shown by Messrs. P. Barr & Sons, King Street, Covent Garden, in which were to be found the best old and new varieties. We have space to mention only some of the more pleasing novelties, viz., Mrs. Thomson, cream-white and yellow, single-flowered; N. Leedsi Madge Mathews, perianth and corona of a pale yellow tint, a small flower, but pretty; N. Burbidgei Princess Louise, N. W. P. Milner, a pale yellow, with the form of N. obvallaris, but rather smaller than that one; N. Leedsi Madame De Graaf; N. incomparabilis Lady Jane; N. i. Gloria Mundi, a bright thing, with deep orange crown, light yellow-coloured perianth-segments; N. Snowflake, white, with a lengthy, narrow corona; N. Nelsoni auruntius, N. W. Goldring, creamy-white and primrose-yellow; N. Dorrien Smith, N. Queen Sophia, with primrose-tinted perianth, and much-spreading, shallow, orange-coloured crown. For the Narcissus a Silver Banksian Medal was awarded; and for a nice collection of species of Tulips, Muscari, Milla, Triteleia, a dozen plants of the showy, rosy-purple-flowered Cheiranthus mutabilis, &c., a Bronze Banksian Medal.

Mr. T. Ware, Hale Farm, Tottenham, exhibited a good and imposing collection of Narcissus, shown in an excellent and profuse manner. There were many duplicate varieties, and of novelties there were the following:—N. incomparabilis Figaro, light and deep shades of yellow, bold and showy; N. montanus, white, with spreading perianth segments, corona half an inch wide and deep; N. Humei bicolor, N. H. concolor, differing from the previous variety in the greater depth of its tints; N. Leedsi Gem, N. Catherine Spurrel, N. Glory of Leyden, N. Barri Orphée. Besides these were flowers of Muscari, the lovely Iris Sari and I. Helenæ, &c. (Silver-gilt Banksian Medal).

Messrs. J. Veitch & Sons showed a considerable number of cross-bred Narcissus, whose origin in all cases was given on the accompanying tickets. These showed great departures in most instances from anything before existent, and when they are grown to their fullest size, as probably was not the case with these, some desirable additions to the species

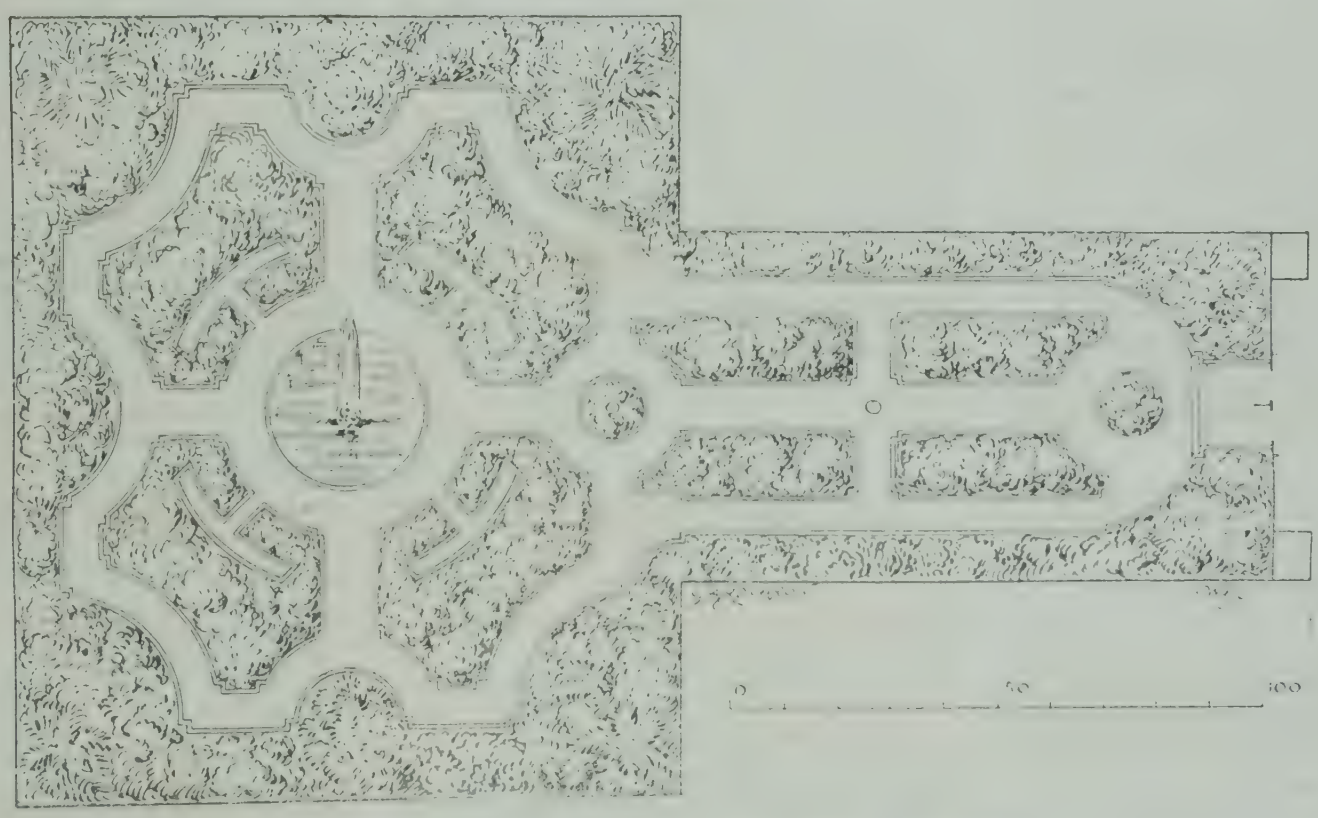

Fig. 69.—Ghent Exhibition: plan of the annexe. (see p. 442.)

will be selected. N. Golden Spur × N. Burbidgei, N. General Gordon × N. Burbidgei, N. H. Irving × N. Stella, N. Golden Spur × N. Stella, N. Apollo × N. obvallaris, N. Apollo × N. Sir Watkin, N. Gen. Gordon × N. cernuus, N. C.Dickens × N. pallidus præcox, N. gloriosa × N. poeticus, &c. Some bunches of very fine blooms of N. telamonius plenus were likewise shown.

Competitive Classes.

Nine varieties of Daffodils, distinct, grown in the open, five blooms of each, amateurs, 1st, Rev. Eugène Bourne, Dunston Vicarage, Lincolnshire; 2nd, A. Kingsmill, Esq., Bushey Heath. There were several more exhibits in this class.

Six varieties of Daffodils, conditions as above, 1st, Rev. G. P. Haydon, Hatfield Vicarage, Doncaster; 2nd, J. W. Melles, Sewardstone Lodge, Chingford.

Collection of Daffodils, 1st, Rev. S. Eugène Bourne, with an extensive collection of small bunches of the best varieties, and well-developed flowers; 2nd, A. Kingsmill, Esq., with few varieties, but larger flowers; 3rd, Rev. G. P. Haydon; 4th, J. W. Melles, Esq.

Seedling Daffodils came from Rev. G. H. Engleheart, Appleshaw, Andover, who sent N. Ajax × N. poeticus poetarum, to show colour of the perianth, the segments of which are white, with a green tinge at the base, corona orange-coloured; N. Ajax × N. poeticus, a result near to N. Nelsoni; N. white Ajax × N. poeticus, the cross showing merely a shortened corona; N. Ajax × N. triandrus; N. Firefly, a white bloom with a nearly scarlet-edged orange corona, very strange looking; N. Aurora has a corona of very uncommon size, it being 1½ inches wide, and 2 inches keep, of pure yellow, and the perianth segments stiffly horizontal, and of a pale primrose.

Mr. J. W. Wilson, South Cave, East Yorkshire, showed a small good assortment of Daffodils, some of them being supposed to be natural seedlings.

The Rev. T. Longley, Conisholme Rectory, Grimsby, and Rev. N. J. Miller, Wanstead Rectory, Hull, showed seedlings and miscellaneous varieties of Daffodils.

Orchid Committee.

Present: Harry J. Veitch Esq., in the chair; and Messrs. J. O'Brien (Sec.), M. T. Masters, De B. Crawshay, S. Courtauld, Rev. E. Handley, E. Hill, H. Low, J. Douglas, R. Brooman-White, C. J. Lucas, J. T. Gabriel, H. Williams, H. Ballantine, and H. M. Pollett.

Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, London, N., staged a very effective group of Orchids, in which were good examples of Cypripedium Morganiæ×, and many others.

Messrs. W. L. Lewis & Co., Chase Side, Southgate, N., arranged a neat group of Orchids, the varieties of Cattleya Mendeli being specially remarkable by their great variation. One of the prettiest was C. M. albens, with white flowers, the labellum tinted with pink. Odontoglossum polyxanthum was also very fine, and included in the group were good O. Hallii, and other species; Ada aurantiaca, Sophronitis grandiflora, and Cypripediums.

From Messrs. Hugh Low & Co., The Nurseries, Clapton, E., came a varied group of Orchids, in which the plants of Cypripedium niveum, C. bellatulum, C. tonsum, and other Cypripediums were prominent. Specially good, too, were a very richly-coloured Phalænopsis Luddemanniana, a large P. grandiflora, Dendrobium superbum, and other Dendrobes and Odontoglossums.

Messrs. F. Sander & Co., St. Albans, had a small group made up of four fine and dissimilar forms of the fragrant Cattleya labiata Schroderæ, one nearly pure white, the elegant new Odontoglossum Kranzlinii, the fine Dendrobium densiflorum var. Schroderi, Vanda teres, a curious dark spotted hybrid Odontoglossum named O. Selwoodensis, &c.

Messrs Jas. Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, showed Cypripedium Clymene× (caricinum ♀, caudatum Wallisii ♂), something like C. Dominyanum, but with a white ground to the flower; C. Melanthus× (Hookeræ ♀, Stonei ♂), a curious hybrid with the tints of C. vernixium, but with long deflected petals; Dendrobium Niobe× (tortile ♀, nobile ♂), with the growth of D. tortile, but flowers like a very fine D. nobile, but rather longer on the footstalk. Messrs. Veitch also exhibited their Cymbidium eburneo-Lowianum, to which a First-class Certificate had before been awarded.

The Right Hon. Joseph Chamberlain, M.P., Highbury, Moor Green, Birmingham (grower, Mr. H. A. Burberry), sent a very interesting exhibit in a three-flowered spike of Cattleya guatemalensis, which, although collected by Mr. Ure-Skinner growing on the same tree as Cattleya Skinnerii and Epidendrums aurantiacum (between which two it is supposed to be a natural hybrid), and sent to Messrs. Veitch over thirty years ago, was supposed to be lost to cultivation. The flowers were as large as those of C. Skinnerii, but with a less convolute lip; the colour orange, shaded with rose, and with purple lines at the base of the lip. Mr. Chamberlain also sent flowers of Cattleya labiata Schroderæ and Dendrobium Nestor ×.

Mr. G. Wythes, gr. to the Duke of Northumberland, Syon House, Brentford, showed three fine plants of Cyrtopodium punctatum splendens, very rich and bright in colour, and a plant of the old but pretty Miltonia flavescens, formerly known as Cyrtochilum stellatum, with nine flower-spikes.

De B. Crawshay, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cooke), showed a very fine spotted hybrid Odontoglossum, in form approaching O. crispum, with a clear white ground, which latter was spotted with brownish-purple; and the rare O. tentaculatum, Rchb. f.

The Rev. E. Handley, Royal Crescent, Bath (gr., Mr. Kerslake), exhibited Cattleya Lawrenceana ornata, a richly-coloured form, in which the tips of the petals are purple, coloured like those of C. Trianæ Backhouseiana; and a spike of a good form of Odontoglossum Andersonianum.

Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, showed a light-coloured form of Cattleya Warscewiczii, from the C. rex country.

Messrs. J. & R. Pearson, Chilwell, Notts, showed a spike of a grand form of Odontoglossum Pescatorei, with large, finely-formed white flowers; and Messrs. Pitcher & Manda. The United States Nurseries, Hextable, Swanley, Kent, sent the very fine and dark-coloured Cypripedium grande atratum ×.

Orchid Committee Awards.

Awards of Merit.

To Dendrobium Niobe ×, from Messrs. J. Veitch & Sons, Chelsea.

To Cattleya guatemalensis, from Right Hon. J. Chamberlain, Birmingham.

To Cyrtopodium punctatum splendens, from the Duke of Northumberland, Syon House.

To Odontoglossum hybrid (Crawshay's var.), from De B. Crawshay, Sevenoaks.

Medals.

Silver Flora.

Messrs. B. S. Williams & Sons, Holloway, for groups of Orchids.

Silver Banksian.

Messrs. W. L. Lewis & Co., Southgate, for groups of Orchids.

Messrs. Hugh Low & Co., Clapton, for groups of Orchids.

Fruit Committee.

Present: Philip Crowley, Esq., in the chair, and Messrs. G. Bunyard, G. Woodward, Harrison Weir, J. Cheal, G. Taber, J. Wright, A. Dean, J. A. Laing, W. Bates, G. H. Sage, G. Wythes, F. Q. Lane, H. Balderson, J. Smith, and Robert Hogg.

A collection of fruit and vegetables came from Mr. Wythes, gr. to the Duke of Northumberland, Syon House. The vegetables, twelve kinds, were good, and the fruit consisted of Grapes, Black Hamburghs, a box of fine Strawberries from Syon House, a Seedling from Keen's Seedling, and a half-dozen fruits of Fig St. Johns (Silver Banksian Medal).

An Apple, named Jacquin, from Messrs. T. F. Rivers & Son, Sawbridgeworth, was awarded a First-class Certificate. The fruit was medium-sized, kindly-looking, and yellow, and possessed a rather deep eye. Two other Apples, named respectively Prince Albert, and St. Johns, were exhibited by Messrs. H. Lane & Son, Berkhamstead, but no award was made.

Apple Royale d'Angleterre was staged by Mr. G. Woodward, Barham Court Gardens, Maidstone.

From the Royal Horticultural Society's Gardens at Chiswick were sent Apples, Bramley's Seedling, Annie Elizabeth, King of the Pippins, Lane's Prince Albert, Galloway Pippin, and Hoary Morning.

Mr. W. Divers, Wierton House, near Maidstone, sent fifteen dishes of Apples, but many of these showed decay, or bruises sustained in travel. Some fruits of Vegetable Marrows, labelled "Sutton's No. 20," were from Mr. C. Leach, gr. to the Duke of Northumberland at Albury Park. The seeds were sown on January 23, and the fruits were fit for use on April 8. Not every taste, however, will appreciate Marrows so early as this date. A few well-fruited plants of Strawberry Royal Sovereign, sent by Mr. Thos. Laxton, seed grower, Bedford, were Culturally Commended. The last exhibit we have to notice gained a First-class Certificate. It was Lettuce Veitch's Golden Queen, and was shown by C. Ingram, Esq. (gr., T. W. Bond), Elstead House, Godalming. It is a good-looking Cabbage variety, hearts were fairly plump, and the leaves tender.

Lecture on the Citron.

In the afternoon, it was announced with much regret, that the paper upon "Orchid Life in Guiana," promised by Mr. Everard F. Im Thurn, had not been received. Under these circumstances the Secretary, Rev. W. Wilks, read a paper by Dr. Bonavia upon "The Antiquity of the Citron in Egypt," the substance of which was contained in the report of the Scientific Committee in our columns last week.

BIRMINGHAM SPRING FLOWER SHOW.

April 5 and 6.—This was a very fine exhibition, taken all round. Orchids formed a distinct feature, and two groups were set up in competition for prizes for groups. The Right Hon. Joseph Chamberlain, M.P., was 1st, with a fine display, at the back of which was a representation of an old tree with Orchids growing on it, and standing on a base of Orchids, Ferns, &c. In this group, amongst others, were the Highbury variety of Lælia anceps grandiflora and L. anceps Williamsii, Dendrobium Dominianum, D. nobile Cooksoni, and D. nobile gigantea; D. Venus, a hybrid between nobilis and Falconeri, Restrepia antennifera, and the very pretty D. lituiflorum, and other choice species, all very tastefully arranged by Mr. Burberry. Mr. Wm. Bown, Beech Lawn (gr., Mr. J. Palmer), 2nd, with Dendrobium album, D. primuloides, D. nobile Cooksoni, and D. nobile nobilius, very rich in colour; Lycaste Skinnerii alba, Odontoglossum Edwardii, O. Halli, and many others.

For six specimen Orchids, the positions were reversed, Mr. Bown being 1st, with a very fine even lot, consisting of Cypripedium villosum aureum, with forty open blooms; a very fine Lycaste Skinneri, Dendrobium Wardianum, a splendid plant of a very fine variety of Cymbidium Lowianum, Cattleya Lawrenceana, rich in colour; and a fair example of Dendrobium Ainsworthii. The Right Hon. Joseph Chamberlain had a fine lot for the 2nd prize, consisting of a fine specimen of Cœlogyne cristata; Lælia anceps Barkeriana, L. a. Williamsii (a very beautiful Orchid), Dendrobiums thyrsiflorum, Falconeri, and Wardianum.

For three Orchids, the Right Hon. J. Chamberlain was 1st, with a grand specimen Cœlogyne cristata, Dendrobium Falconeri, and a fine D. thyrsiflorum; 2nd, Mr. Bown, with Dendrobiums suavissimum, fimbriatum, and nobile.

With single specimen Orchid, Mr. Bown was 1st, with a very fine Cymbidium eburneum, with forty spikes of flowers; 2nd, Mr. Chamberlain, with Sobralia macrantha; 3rd, J. A. Kenrick, Esq., with a fine Dendrobium nobile.

Specimen Azaleas were numerous and fine, chiefly pyramids of large size. Some wonderfully-fine pyramidal Cytisus were shown, and also a large handsome standard, and some good specimen stove and greenhouse plants. Probably at no other exhibition can such magnificent plants of Hydrangea Thomas Hogg be seen, specimens quite 4 feet through, superbly grown and flowered. Monster Deutzias, abundantly bloomed; Spiræas, Dielytras, Ghent Azaleas, and other invited plants for prizes were all highly meritorious. The chief prizewinners being the gardeners respectively to Sir Thomas Martineau, Mrs. Marigold, Mr. T. Clayton, Mr. Grice, and others.

It was feared that the very hot weather experienced at the end of March and early in April would have driven the Hyacinths and Tulips out of condition to a great extent, but it was surprising the large number of plants staged, and their fine quality generally.

In the class for eighteen Hyacinths for the Society's prizes, Mr. Bown was 1st, with a well-done lot; and Mr. Dyer, gr. to Mrs. Marigold, a very close 2nd. For twelve, Mr. A. W. Hulse was 1st, with a capital lot, and also 1st for six. Although in some instances the spikes were rather undersized, excellent cultivation was noticeable throughout, and in the competition for Messrs. Thomson's special prizes for eighteen Hyacinths, there were nine competitors, Mr. Hulse securing 1st with a fine lot.

The Tulips were remarkable for good culture, and with fine robust foliage, and there was a fine display of them. The white Joost van Vondel was in all

the collections, a grand snow-white; and Proserpine was conspicuous, and is always very fine; Ophir d'Or is a grand yellow.

Narcissus in pots, but with scarcely any of the old Polyanthus varieties, were numerous, and well done, Mr. Robert Sydenham's special prizes for twelve pots bringing out a grand display; Mr. A. W. Hulse taking the 1st prize.

Honorary exhibits were numerous. Messrs. Dicksons, Limited, Chester, had a capital display of Narcissus, and cut blooms of rare early-blooming hardy plants. Messrs. Ryder & Co., Sale Nurseries, Manchester, had a collection of their lovely new Primula Sieboldii varieties, including Miss Kelly, Maiden's Blush, General Gordon, Mrs. Ryder, Mrs. H. Jones, Magnifica, Harry Leigh, Dora, and a very pretty fringed variety named Maiden's Blush.

Messrs. Barr & Sons, King Street, Covent Garden, London, staged a group of fine varieties of Narcissus, including Marchioness of Lorne, J. B. M. Camm, Lady Grosvenor, Queen of Spain, C. J. Backhouse, and a grand variety, M. J. Berkeley, deep golden-yellow; and other choice kinds.

Messrs. Cutbush & Son, Highgate Nurseries, London, had an interesting group of new double Ghent Azaleas, new Cliveias, and other plants.

Messrs. Hewitt & Co, Solihull Nurseries, had a tasteful group of plants, including several of the very lovely white hardy Azalea Davisii, Mollis Azaleas, and other plants. Messrs. Rich. Smith & Co., Worcester, had a large display of Clematis, Rhododendrons, Japanese Maples, and other hardy plants. Messrs. Thomson & Co., Sparkhill Nurseries, one of their usual well-arranged groups, and a superb floral design. Messrs. Pope & Sons, King's Norton Nurseries, contributed a group also, with a grand group of shower and other bouquets of Narcissi, also a group of the newer sorts of Clematis; and Mr. Robert Sydenham, Tenby Street, had a collection of new and older Hyacinths, all well grown, amongst them King of the Yellows, very fine; Etna, Morina, both reds and fine; Peter Barr, a lovely purple with white centre; Princess of Wales, pink; Princess Amelia, white; Duchess of Edinburgh, with grand spikes; Cardinal Wiseman, Pink Perfection, and several others; also very fine Tulips, Narcissus, and Cyclamens.

BRIGHTON AND SUSSEX NEW HORTICULTURAL.

April 11 and 12.—The second annual spring show in connection with the above took place in the Dome and Corn Exchange, Royal Pavilion, on the above date. The first day was fine, though rather cold, but there was a good assembly. This Society, though only started twelve months ago, bids fair to eclipse anything of the kind in the South of England. The exhibits were both numerous and of good quality. Round the Dome were staged a variety of plants and cut flowers, the centre being used as a promenade concert.

The class for twelve pots of Hyacinths, owing to the late hot weather, was not largely represented, but those shown by Mr. G. Hart, which took 1st prize, did great credit to the exhibitor. The same may be said of the Tulips, which gained 1st honours for Mr. C. Murrell. Narcissus and Freesias were but poorly represented, but those in the latter class which won the 1st prize were exhibited by Mr. G. Hart. Lily of the Valley was in strong force, Mr. J. Gore taking 1st, with twelve nice pots, with dark green foliage. Dielytras were fairly good; most of the plants, however, were past their best, owing, no doubt, to the strong sunshine we have had of late—1st, Messrs. Miles, Brighton..

For six Roses, 1st, Mr. E. Meachen, gr. to Mrs. Armstrong, with well-bloomed moderate-sized plants. Lachenalias were very good, Mr. E. Meachen again taking 1st.

In the class for six Gloxinias, 1st, Messrs. J. Peed & Sons, nurseries, Norwood Road, London, with plants moderately bloomed, the flowers of good size and fine colour. Cyclamens from the same exhibitor formed a grand lot, and attracted many admirers. Spiræas were not so good as we have seen them, the plants being too much drawn; 1st, Mr. George House, Patcham.

In the class for six pots of Mignonette, Messrs. Peed & Sons were 1st; and Mr. Murrell was 1st for Cinerarias, with dwarf, bushy, and well-flowered plants. The same may be said of those shown by Messrs. G. Miles in the class for six.

Primulas, especially the single-flowered varieties, showed the effects of sunny weather, the flowers being small. Those from Mr. Miles, which were 1st, were exceptionally good, considering the lateness and character of the season.

Hydrangea hortensis in pots were very fine; those shown by Mr. H. Smythe, Dyke Road, Brighton, were grand plants.

In the Auriculas and Polyanthus, freshness and variety were wanting, especially amongst the former. Genistas were good; 1st, Mr. G. F. Wickham. Messrs. Peed & Sons were 1st for Pelargoniums. Stocks were not a large lot, but those shown by Mr. H. Smythe were well worthy of the highest award which fell to them.

For twelve Azaleas, 1st, Mr. Murrell, with twelve compact, well-flowered plants; and Mr. E. Meachen 1st for twelve plants. For Azalea mollis, Messrs. Miles & Co. were 1st; while in the classes for Deutzias and Richardias the honours fell to Mr. Meachen and Mr. Murrell respectively.

There was strong competition in the class for miscellaneous groups arranged for effect, and we must admit that these added greatly to the beauty and interest of the show. Those set up by Mr. J. Turner, gr. to Sir G. Smyth, and which gained him 1st honours, were excellent. The 2nd prize in this class fell to Messrs. Miles, Brighton.

Tables of plants also arranged for effect were good. 1st, Mr. W. Jupp, gr. to G. Boulton, Esq.; 2nd, Mr. Turner. The classes for cut flowers were not large, but there were some fine stands, notably those from Mr. J. Gore, Polegate, who was 1st for twelve varieties. For bunches of Narcissus, Mr. Rupert Miller was 1st.

There were some good dishes of Strawberries exhibited by Mr. Bell. Strawberry plants in pots were also good, especially those shown by Mr. E. Golding, gr. to H. S. G. Voules, Esq., Brighton.

Mr. F. Fairs, of Hassocks, showed new Grapes, and received 1st prize; whilst Mr. H. C. Prinsep, gr., Buxted Park, Uckfield, was 1st for a brace of Cucumbers. Miscellaneous non-competitive exhibits comprised a fine group of plants from Messrs. W. Balchin & Sons, Nurserymen, Brighton, which filled the end of one large room, and contained choice plants. Mr. H. C. Prinsep staged a collection, including Dendrobium densiflorum, with dozens of racemes of flowers. Messrs. J. Cheal, of Crawley, made a display with Apples, cut flowers, plants, &c.; and Mr. Kemp, gr. to C. R. Scrase Dickens, Esq., staged a fine lot of Apples and last year's Grapes in prime condition.

FRUIT REGISTER.

APPLE STURMER PIPPIN.

Every gardener knows that April is the most difficult month in the year to keep up a plentiful supply of dessert; the new fruits are not ready in quantity, and the old ones are scarce. I find this Apple most useful to help to keep up the supply, but in many places it is gathered too soon. The last week of October is quite early enough, and if the weather is open it may be even later. I am most particular that no injury to the fruit takes place during gathering or storing. They are carried straight to the fruit-room, placed in boxes or jars, with alternate layers of sand, and left for coolness on the floor, where we never think of disturbing them till March, when they come in most useful, and are really very excellent in flavour; seeing that the Ribstone and Nonpareil are its parents, it would be odd if the flavour was deficient. The tree is hardy, and a good bearer, but I never could understand why the bullfinch is so partial to the buds, much more than any other tree in the orchard, and we grow above a hundred kinds. *J. Rust, Eridge Castle.*

Apple Cockle Pippin.

This variety I have had in excellent condition up to the present, and being a good cropper, as well as an excellent grower, I think it is to be recommended for late dessert purposes. Out of some twenty varieties I submitted to a gentleman about a month ago for the purpose of selecting some good ones, Cockle Pippin was first in his estimation. So enraptured was he with this variety, that he surprised me about a week ago by sending me a "Study of the Cockle Pippin and Brabant Bellefleur" in oil—both very faithful representations—which I prize very much. *South Devon.*

Good Dessert Apples.

Last autumn was perfect for the maturation of fruit Among varieties that I have had in excellent condition up to a few weeks ago, I may mention Lord Burghley, I never remember having so good before—clean, perfect in colour, some almost covered with a deep crimson. Claygate Pearmain: this, too, was wonderfully good, and has kept better than usual. Brabant Bellefleur, though classed as a culinary variety, is excellent for dessert, and is in my estimation much more a dessert than a culinary variety; perhaps of all others this has been the most handsome Apple I have grown, and I have 120 varieties. Many of these were entirely covered with crimson, and kept splendidly. Pearson's Plate, an old variety, of fine flavour, very delicious and juicy; this is generally of a russet colour, but with me they had a great deal of crimson this past season. Boston Russet: this is an excellent cropper and good keeper; in fact, will keep for some time yet. Braddick's Nonpareil is a well-known variety of first-class quality. *South Devon.*

SCOTLAND.

GARDENERS' SATURDAY HALF-HOLIDAY.

It may be interesting to some of the readers of your paper to know that the young gardeners of Falkirk and district formed themselves into an Association (Falkirk and District Assistant Gardeners' Association) for the purpose of petitioning their employers for a half-holiday on the Saturday afternoon.

The Association has been very successful, as most of the gentlemen in Falkirk and surrounding district have granted the half-holiday to their gardeners. But there are one or two gentlemen who have not as yet sent a reply to the circular sent out by the Association, so that there is still a hope that they may be in favour of the half-holiday, and place their gardeners on the same footing as others in the district. The success of the Falkirk Association may encourage gardeners in other districts where they have not as yet got the half-holiday, to take steps so that they may be put on a level with districts where they have already got the privilege of the Saturday afternoon.

After the above Association had dismissed itself, some of those present spoke of the advisability of forming a Gardeners' Mutual Improvement Society, and, with a view to forming such a society, a meeting will shortly be advertised in the local papers.

Such a society will, no doubt, be a success with so many gardeners as there are in Falkirk and surrounding district, especially when we note the success of some of them at the leading shows of Scotland, and also at the number of enthusiastic competitors at the spring show held in the Town Hall, Falkirk, last week, and I think such a society would be both instructive and beneficial to all who take an interest in gardening.

MARKET GARDENING UNDER GLASS.

(*Continued from p.* 416.)

Mr. J. Myatt, Swanley.

About 1½ mile from Swanley Junction, is Mr. Myatt's place, and here the trade is all in cut flowers and fruits. No plant trade whatever is done. Roses are done in great quantity, many houses, 220 feet long, being planted on either side with Tea varieties. At the time we visited the place, Mr. Myatt was marketing as many as 100 dozen of Niphetos in a week. The perpetual section are in pots, the usual varieties, Baroness Rothschild and General Jacqueminot being those grown. Callas were here again in immense number, yielding an output of about 150 dozen in a week. Cyclamens are grown to a large extent, but only for furnishing cut bloom. There were many hundreds of

Pelargonium Madame Cruze and White Queen, but the latter variety meets with but little favour, whilst the former is exceedingly popular. Here we met for the first time during these visits, a first-class batch of French Beans, there were many hundreds of pots, and they were doing well. The pods were then about ½ inch long, and must now be fit for market. Tomatos have one house to themselves, about 200 feet long—a wide span. The plants are put out in rows, four rows being upon each side of the centre path. This house will yield a large supply, and there are many more to be accommodated in various positions in the other houses. About 7000 Strawberries are forced, and there are one or two houses devoted to Vines. In many of these gardens it pays better to bring the Strawberries along in a cool-house, some growers using no heat whatever, and they then mature their fruit about the beginning of May, or between the supplies from the heated houses and the open air. Although this place is not one of the largest, there are consumed each year about 600 or 700 tons of South Wales coal. There are two very fine Mushroom-houses over 200 feet in length, all above-ground. In shape they are like a Potato-ridge, and the centre is about 6 feet high. The inside is lined with wood, above which is a thick layer of straw, which is again covered with good thick thatch. Of course, the houses are perfectly dark. The beds are upon the floor, with the path running between them; and they are exceptionally convenient of access, and of working. During the winter they have furnished from seventy to eighty pounds of Mushrooms per week. A kind of reservoir has lately been made here, to which the rain-water from the whole of the houses is conducted, and by means of one of the Pulsometer Engine Company's engines, this is pumped into an elevated tank, from which there is a fall to the places where it is required.

Mr. H. Staples, Swanley.

This interesting place is situate about 1½ mile from Swanley Junction, in a snug little spot known as Swanley village. We said interesting, because Mr. Staples never intended to become a market gardener when he built his first vinery some thirty years ago. Until that time he had been cultivating a large farm, but was then desirous of retiring from the greater part of this, merely reserving about 40 acres of freehold which immediately adjoined his beautifully-situated house. As something wherewith to occupy his leisure time, a vinery was built, and this like every first step was of the most primitive kind. It was a lean-to, and so little regard to economy in respect of timber was given, that the rafters were actually made 9 inches deep. Of course, the shadow cast by such an amount of timber was ruinous, and so at last the roof was taken off, and the wood taken therefrom was found sufficient for at least one other house, beside furnishing the rafters for the old house. But Mr. Staples became fonder of this recreation, and one by one other houses were erected, until now he may be called a market gardener, for the quantity of Peaches, Grapes, and Strawberries produced here for market is considerable. Only one variety of Strawberry, and that Sir Charles Napier, is grown, and they are kept quite cool in span-roofed houses, about 240 feet long, and 21 feet wide. The fruit sells well, and is ready a short time before those grown outside. About 27,000 plants are here in pots, and the crowns are looking plump and healthy. In these houses a crop of Cucumbers is secured after the Strawberries are gathered. Peaches have a beautiful span-roofed house for their accommodation, and are looking healthy, and abound in well-ripened wood. Beside the Vines already possessed, Mr. Staples has erected three houses on the most modern principle, each 212 feet long by 30 feet wide, likewise to be planted with Vines. Each house will contain one variety only. In one Black Alicante, in another Muscats, and in the third Gros Colmar. Nine other houses of 165 feet each, are principally devoted to Strawberries. In one house was a batch of East Lothian Stocks in pots, and in full bloom. We have never seen such a fine lot in March, the beautiful white-scented flowers seeming to carry one further into the spring than anything else had yet done. Strawberries, Peaches, Vines, Tomatos and Cucumbers are the principal products of Mr. Staples' establishment. In everything that he has attempted he has spared no pains to make it a success. The fruit grown is of best quality, and the place bears the stamp of neatness and order.

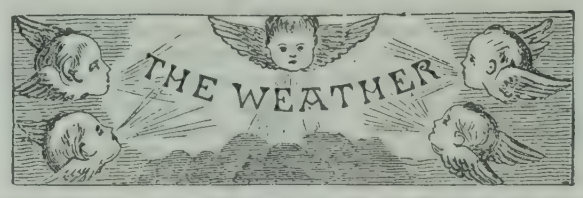
About 14 acres of black Currants adjoin the houses, many more acres of Apples and other out-door fruits. Thus Mr. Staples has gradually—shall we say, risen?—from a large farmer to a successful fruit grower.

(To be continued.)

Obituary.

Mr. W. R. M'Kelvie.—It is with regret that we have to announce the death of Mr. William Ross M'Kelvie, Public Parks and Cemeteries, Dundee. The deceased, whose age was between sixty and seventy years, was appointed to the Dundee post thirty years ago.

A Valuable Orchid.—As an instance of the great value some collectors attach to large specimens of fine species or varieties of Orchids, may be cited the case of a plant of a very fine variety of Cattleya Mendelii with thirty-two pseudobulbs, eight of these with sheaths, which was sold by Messrs. Protheroe & Morris, at the Quorn House Sale, on Monday, April 10, for the sum of 220 guineas, the purchasers being Messrs. Hugh Low & Co.



[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees — a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.

The Past Week.

The following summary record of the weather for the week ending April 8, is furnished from the Meteorological Office:—

"The *weather* was again almost continuously fine and bright during the period, the only exceptions being (1) at some of the Scotch stations, where rain fell on one or two occasions, and (2) on our east and south-east coasts, where some dense wet fogs caused a deposit of water in the rain gauge.

"The *temperature* continued above the mean, the days being warm and the nights somewhat less cold than those for the weeks immediately preceding. The excess in 'England, S.W.' was as much as 7°, in the 'Channel Islands' 6°, over southern and north-western England of 5°; in Ireland there was an excess of 4°, and in 'England, E. and N.E.,' 2°. The highest of the maxima were recorded on rather irregular dates, and ranged from 73° in 'England, S.W.,' and 70° in 'England, E.,' to 65° in 'England, N.E.' The maximum readings on our east and south-east coasts were much lower than those inland; in many cases they were as low as 42° to 45°. The lowest of the minima were registered during the middle part of the week, when they ranged from 25° in 'Scotland, E.' and the 'Midland Counties,' to 32° in 'England, N.E.,' and to 43° in the 'Channel Islands.'

"The *rainfall* was again wanting over England and nearly so over Ireland and Scotland; in the northern parts of the latter country, however, some rather heavy falls occurred on the 6th.

"The *bright sunshine* continued very prevalent generally, the percentage of the possible duration ranging from 38 to 60 in Scotland, from 53 to 66 in Ireland, and from 61 to 74 in England; in the 'Channel Islands' the percentage was as high as 79."

Markets.

COVENT GARDEN, April 13.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

A slight check to supplies this week, with prices unaltered. A heavy shipment of Tasmanian Apples to hand realising very low prices, condition generally not good. *James Webber, Wholesale Apple Market.*

POTATOS.

Trade for old Potatos still very slow and prices low, except for best samples, which maintain fair prices.

NEW POTATOS are arriving in large quantities, both from Teneriffe and Malta—Rounds making 11*s.* to 13*s.*; Kidneys, 12*s.* to 22*s.* per cwt. *J. B. Thomas.*

SEEDS.

LONDON: *April* 12.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report a steady sowing demand for Clover and other seeds. As regards values no change of importance can be noted. A good downfall of rain would now be much welcomed. Tares realise last week's figures. For bird seeds the sale is slow. There is no change in either Haricots or Peas. The Board of Trade Returns give the imports into the United Kingdom of Clover and Grass seeds for the past quarter as cwts. 148,680, value £376,004, as against cwts. 152,800, value £348,224, for the corresponding period of 1892.

FRUITS AND VEGETABLES.

BOROUGH: *April* 11.—Quotations:—Kale, 1*s.* to 1*s.* 6*d.* per bushel; Turnip-tops, 2*s.*; Broccoli, 1*s.* 6*d.* to 2*s.* 6*d.* per bag; Greens, 1*s.* 6*d.* to 2*s.*; Parsley, 3*s.*; Carrots, 2*s.* 6*d.* to 3*s.* 6*d.*; Turnips, 1*s.* 6*d.* per dozen bunches; English Onions, 8*s.* to 9*s.* per cwt.; Horseradish, 2*s.* 3*d.* to 2*s.* 6*d.* per bundle; Apples, 4*s.* 6*d.* to 6*s.* per bushel.

SPITALFIELDS: *April* 11.—Quotations:—American Apples, 10*s.* to 15*s.* per barrel; foreign Tomatos, 1*s.* to 1*s.* 6*d.* per box; Spinach, 2*s.* 6*d.* to 3*s.* per cwt.; Turnip-tops, 2*s.* 6*d.*; Sprouting Broccoli, 2*s.* 6*d.* to 3*s.* 6*d.* per sack; Cauliflowers, 5*s.* to 7*s.* 6*d.* per tally; Greens, 2*s.* 6*d.*; Carrots, 2*s.* 6*d.* to 3*s.*; Parsley, 8*s.* per dozen bunches; Turnips, 2*s.* 6*d.* to 3*s.* per bag; forced Rhubarb, 1*s.* to 1*s.* 3*d.*; natural do., 2*s.* to 2*s.* 6*d.* per dozen bundles; Horseradish, 2*s.* 6*d.* per bundle; Spring Onions, 3*s.* to 3*s.* 6*d.* per dozen bunches; Endive, 1*s.* 6*d.* to 2*s.* 6*d.* per dozen; Mustard and Cress, 2*s.* per dozen baskets; English Onions, 18*s.* per cwt.; Belgian, do., 7*s.* to 8*s.* per bag of 110 lb.; Carrots, 50*s.* to 70*s.* per ton; Curly Kale, 1*s.* 3*d.* to 2*s.* 6*d.* per bushel; Sea-kale, 1*s.* 3*d.* to 1*s.* 6*d.* per punnet; Parsnips, 8*d.* per score.

STRATFORD: *April* 12.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade has been done at the undermentioned prices:—Greens, 2*s.* to 3*s.* per bag; do., 1*s.* 3*d.* to 1*s.* 9*d.* per sieve; Cauliflowers, 1*s.* 6*d.* to 2*s.* per dozen; do., 6*s.* to 9*s.* per tally; Carrots, household, 40*s.* to 50*s.* per ton; do., cattle feeding, 18*s.* to 34*s.* do.; Parsnips, 6*d.* to 9*d.* per score; Mangels, 18*s.* to 21*s.* per ton; Swedes, 18*s.* to 20*s.* per ton; Onions, English, 220*s.* to 240*s.* do.; do., Dutch, 8*s.* to 8*s.* 6*d.* per bag; Apples, English, 2*s.* to 6*s.* per bushel; do., American, 12*s.* to 20*s.* per barrel; Sprouting Broccoli, 2*s.* to 3*s.* per bag; Rape, 1*s.* 9*d.* to 2*s.* do.; Rhubarb, 2*s.* to 2*s.* 6*d.* per dozen; Cucumbers, 3*s* to 4*s.* per dozen.

FARRINGDON: *April* 13. — Quotations: — Parsnips, 40*s.*; Carrots, 55*s.* to 60*s.*, per ton.; Onions, English, 18*s.* to 20*s.* per cwt.; Cucumbers, 2*s.* 6*d.* to 3*s.* 6*d.* per dozen; American Apples, 14*s.* to 15*s.* per barrel; Tasmanian Ribston, 10*s.* to 12*s.* 6*d.* per case; Asparagus, 1*s.* 3*d.* per bunch.

POTATOS.

BOROUGH: *April* 11.—Quotations:—English Magnums, 40*s.* to 60*s.* per ton. No alteration in other sorts.

SPITALFIELDS: *April* 11.—No alteration in rates. Trade dull.

FARRINGDON: *April* 13.—Quotations:—Main Crop, 85*s.* to 90*s.*; Sutton's Abundance, 75*s.* to 80*s.*; Bruce's, 60*s.* to 65*s.*; Imperators, 55*s.* to 60*s.*; Magnums, 45*s.* to 55*s.* per ton.

STRATFORD: *April* 12. — Quotations:— Magnums, 40*s.* to 60*s.*; Bruce's, 45*s.* to 70*s.*; Imperators, 40*s.* to 60*s.*; Scotch Magnums, 55*s.* to 65*s.*; do. Bruce's, 60*s.* to 75*s.*; Main Crop, 80*s.* to 90*s.* per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending April 8, and for the corresponding period last year:—1893: Wheat, 24*s.* 6*d.*; Barley, 25*s.* 6*d.*; Oats, 17*s.* 11*d.* 1892: Wheat, 31*s.* 4*d.*; Barley, 26*s.* 11*d.*; Oats, 20*s.* 2*d.*

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 60*s.* to 115*s.*; do., inferior, 70*s.* to 75*s.*; hay, best, 85*s.* to 115*s.*; do., inferior, 55*s.* to 75*s.*; and straw, 33*s.* to 46*s.* per load.

JAMAICA PINE-APPLES. — According to a recent number of the *Bulletin of the Botanical Department of Jamaica*, the number of Pine-apples exported in 1892 was 10,294 dozens, of the aggregate value of £1286 15*s.* 2*d.* The larger number went to the United States.

Answers to Correspondents

ANTS AMONGST CATTLEYA PLANTS: *T. A.* Could you not drown out the insects by immersing the plants? They could be entrapped in saucers holding treacle, or driven away by the use of carbolic acid or petroleum, of course not letting either of these touch the plants. Pieces of wool dipped in the latter, and placed in their haunts, would be distasteful to the ants, &c.

BOOK: *F. E. E.* So far as we know, there is no separate manual published on the cultivation of the Cyclamen. It is all a very simple affair, and full directions are to be found in most of the recently-published books on gardening.

LOQUAT TREE NOT FLOWERING: *J. L.* When the wood is imperfectly ripened, and this may occur indoors in badly-lighted or shaded glasshouse, as well as out-of-doors, the plant does not bloom well, and fruit seldom sets. The plants are the most prolific of bloom out-of-doors when they are planted against a sunny wall, rock, or what not, and either have their shoots trained out thinly against the wall or other object, or grown in bush form, taking care to cut out weakly growths, and otherwise obviate crowding of the branches. Occasional lifting, so as to keep the roots at a high level, and employing surface feeding to keep the plant in vigour, should be attended to. Mulching thinly with litter is needed in dry soils. A layer of boulders, the size of a cobbler's lapstone, placed on the soil around the roots, to a space of 2 to 3 feet from the stem, would answer the same purpose, drawing the roots to the surface in consequence of their moisture-retaining properties, and the warmth they impart to the soil; moreover, they are more sightly than litter. This holds good of other plants besides the shy-flowering Loquat.

NAMES OF PLANTS: *J. B.* 1, Juniperus sinensis; 2, Saxifraga—not recognised, send when in flower; 3, Amelanchier vulgaris.—*J. D.* 1, Spiræa prunifolia; 2, Kerria japonica; 3, Erica carnea; 4, Andromeda calyculata; 5, Berberis vulgaris.—*Matfen.* Mercurialis perennis.—*F. E. S.* Mackaya bella.—*T. H.* 1, Cephalotaxus pedunculata; 2, A Selaginella, not recognised; 3, Leucojum æstivum; 4, Scilla nutans var. alba; 5, Spiræa callosa.—*D. B. & T.* Next week.—*W. A. Lancaster.* Dendrobium clavatum.—*S E. B.* Odontoglossum luteo-purpureum.—*J. R. Haig.* Helleborus orientalis, a poor form.—*Francis H.* Iresine Lindeni.

VINES: *W. B.* If they do not soon begin to grow, kindly send roots and wood, as previously advised.

LARGELY INCREASED CIRCULATION of the "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—*The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,*

Increased to the extent of 75 per cent.

Advertisers are also reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS *at home, that it has a specially large* FOREIGN AND COLONIAL CIRCULATION, *and is preserved for reference in all the principal Libraries.*

PEARSONS'
CHEMICAL MANURE.

This Manure has now been before the public for five years, and has, from its intrinsic merits, almost without advertising, forced its way into the front rank. Extensive trials during above period have convinced us, that for efficiency and cheapness, there is nothing in the market to touch it; we having employed it with the fullest success upon Vines and other Fruit Trees, Pelargoniums, Fuchsias, Chrysanthemums, and almost all kinds of Greenhouse Plants; this opinion is supported by all the gardeners who have tried it, all being enthusiastic in its praise.

Per ton, £16; per cwt., 20s.; ½-cwt., 12s.; 28 lb., 7s.; 14 lb., 4s.; 7 lb, 2s. 6d. Sample Tins, 1s. 3d.

Half-cwt. and upwards sent Carriage Paid to any Station in England, Scotland, or Wales.

Circular, containing further details, instructions, and testimonials, free on application.

J. R. PEARSON & SONS,
CHILWELL, NOTTS.

PATENT
SILICATE MANURE.

Dress Your Vines and Tomatos with it now.

"Royal Nurseries, Great Grimsby,
"September 2, 1892.

"We have used it liberally on Tomatos and Vines. The Tomatos have been a wonderful crop. The Manure seems to have a very great effect on the ripening and swelling of the fruit. Faithfully yours, (Signed),
"CHARLES COLEBROOK AND SON."

PRICES IN SACKS, AT WORKS—
10s. per Cwt.; £2 per ¼-Ton; £3 15s. per ½-Ton; £7 per Ton.

ADDRESS—THE CHEMICAL WORKS,
HEMEL HEMPSTEAD, HERTS.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"

ESTABLISHED 1794,

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let, would do well to advertise in the "WORCESTER HERALD," the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation, Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

Apply for Terms.

SPECIMEN FREE. *Price 2d.*

F. SANDER AND CO. can recommend several highly qualified and energetic HEAD and UNDER GARDENERS, of excellent character, and proved ability; men thoroughly fitted for all the various duties of their profession. For all particulars, please apply to—
F. SANDER AND CO., St. Albans.

B. S. WILLIAMS AND SON beg to intimate that they have at present in their Nursery and upon their Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Victoria and Paradise Nurseries, Upper Holloway, N.

GARDENER (Head); age 30.—J. DUMBLE, Gardener to Sir Charles Philipps, Bart., Picton Castle, Haverfordwest, is desirous of recommending his General Foreman, H. Butcher, to any Lady or Gentleman requiring a thoroughly competent man. He has a good knowledge of the different branches of Gardening, is well acquainted with the Cultivation of Fruit (Indoor and Out), Flowers and Vegetables, is also a most successful Grower of Chrysanthemums for Exhibition.

GARDENER (Head).—J. MAYNE, Bicton Gardens, Budleigh Salterton, recommends a man as above; thoroughly acquainted with all matters relative to Horticulture. Testimonials of the highest order.

GARDENER (Head).—W. FISHER, Gardener to the Earl of Cawdor, would be pleased to recommend his Foreman, CHARLES DAVIS, to any Lady or Gentleman who is in want of a first-class man.

GARDENER (Head), or GARDENER and BAILIFF.—£5 Bonus for information as will lead to obtaining a good situation. Highest references.—HORTUS, Mr. Heath, Bookseller, Richmond, Surrey.

GARDENER (Head); age 31, married, one child.—W. ELKIN, Gardener to Mrs. Agnew, Fairhope, Eccles, is desirous of recommending his Foreman, E. Belcher, who has been with him nearly five years, to any Lady or Gentleman requiring a thoroughly competent Man. He has a good knowledge of the different branches of Gardening, is well acquainted with the Cultivation of Fruit, Flowers, and Vegetables, is also a good hand at House and Table Decorations.

GARDENER (Head), where five or six are kept; age 36, married, one child.—A GENTLEMAN can with every confidence recommend his Gardener, who has been with him upwards of six years. Thoroughly experienced in all branches. First-class references from good establishments. Successful Fruit Grower. Can Manage Stock if required.—J. VOSS, Finches, Lindfield, Sussex.

GARDENER (Head), or GARDENER and BAILIFF.—Age 46: twenty-five years' thorough practical experience in all branches; two and a half years in present situation; eleven years previous as Head Gardener and Bailiff. Excellent character and testimonials. Wife Dairy or Poultry. Family grown up.—HEAD GARDENER, The Gardens, Buccleuch House, Richmond, Surrey.

GARDENER (Head).—Age 26; single at present.—W. EDWARDS, Gardener to Louisa Lady Ashburton, Addiscombe Park, Croydon, desires to recommend his Foreman, John Croft, who has been with him three years, to any Lady or Gentleman desiring an efficient Gardener.

£5 will be given for intimation that will secure situation as HEAD GARDENER; thorough in all branches; excellent character.—HORTUS, Mr. Miles, High Street, Chislehurst.

GARDENER (Head), where two or more are kept.—Age 36, married; thoroughly experienced in all branches of Gardening. Good Orchid Grower. Fourteen years in last situation.—J. H., Messrs. H. Cannell & Son, Swanley Junction, Kent.

GARDENER (Head Working).—Age 30. THOS. NEWTON, Campsall Gardens, Doncaster, will be pleased to recommend to any Lady or Gentleman a good practical all-round Gardener.

GARDENER (Head Working), where two or more are kept.—Advertiser will give £2 for reliable information as will lead to his obtaining the above early in June. Good character.—GARDENER, Home Farm Cottage, Langley, Slough, Bucks.

GARDENER (Head Working).—Age 34, married; thoroughly experienced in all branches of Gardening. Leaving through establishment breaking up. Good character.—F. FITZWATER, The Gardens, Hillfield, Ashtead, Surrey.

GARDENER (Head Working).—Married, two children, ages 7 and 11.—A GENTLEMAN wishes to recommend his late Head Gardener, who has been with him six years. Understands Vines, Melons, Stove and Greenhouse Plants, and Flower and Kitchen Gardening; fourteen years' previous good character.—GEO. TURNER, Cranmore Lodge, Elmstead, Chislehurst.

GARDENER (Head Working), or GARDENER and BAILIFF.—A GENTLEMAN can highly recommend his Gardener as above. Thoroughly experienced in all branches, Indoors and Out, Fruit, Flowers, Vegetables, and Kitchen Garden. Land and Stock. Good judge, buyer, and seller. Wife can manage dairy, poultry; or Caretaker if required. Fifteen years' reference, no incumbrance.—F. D., 48, Disraeli Road, Putney, S.W.

GARDENER (Head Working), where five or six hands are kept.—Age 33, married, two children. Earl STANHOPE wishes to strongly recommend a thoroughly practical man; five years his Foreman.—Mr. SUTTON, Chevening, Sevenoaks.

GARDENER (Head Working).—Married; thoroughly experienced.—A GENTLEMAN highly recommends the above, who has been in his service over fourteen years.—B., Tollerton Hall, Notts.

GARDENER (Head Working), where three or four are kept.—Age 33, married, no family; eighteen years' experience in Vines, Melons, Cucumbers, Stove and Greenhouse Plants, Flower and Kitchen Garden. Six years' good character. Disengaged.—GEO. GOODSELL, 16, Victoria Terrace, Ridley Road, South Wimbledon.

GARDENER (Head Working), where one or two others are kept.—Age 35, wife (36), one child; good all-round experience. Good Grower of Grapes and Peaches. Understands the Management of Cattle and Poultry. Could undertake Management of Farm. Good characters from previous and present employers. Total abstainers.—F. S. B., Pocklington Library, Cliff Town, Southend-on-Sea, Essex.

GARDENER (Head Working).—Age 34, single; thoroughly experienced seventeen years. Could manage small Grass Farm and Poultry if required. Distance no object.—A. E. COLMAN, 12, Lind Street, St. John's, Deptford.

GARDENER (Head, or good Single-handed).—Age 30, single; thirteen years' good experience. Good personal character from late employer. Abstainer.—A. B., 69, Singlewell Road, Gravesend.

GARDENER (Head, or good Single-handed).—Age 36, married; twenty years' experience; good reference.—G. L., 77, Parish Lane, Penge, Kent.

GARDENER (Single-handed), or where two are kept.—Age 26, single; understands Greenhouse, Flower, and Kitchen Garden work. Good character. Now disengaged.—BLUNDELL, West Lodge, Addington Park, Croydon, Surrey.

GARDENER (Single-handed).—Age 24; abstainer. Well experienced in all-round Gardening, inside and out. Excellent character from present and previous employers.—L. P., 28, Finchley Park, North Finchley, N.

GARDENER (Single-handed, or where help is given).—Age 26; thirteen years' experience. Good characters from present and late employers.—JOSEPH SKELTON, Hilton Lodge, Reigate, Surrey.

GARDENER (Single-handed, or where help is given).—Age 25, married; eight years' experience, Inside and Out. Two years' first-class character.—W. GORRINGE, Sunte, Lindfield, Hayward's Heath, Sussex.

GARDENER (Single-handed).—Good all round man, with glass experience. Wages, 22s. per week. Fifteen and three years' character.—PRIOR, Three Elms, Henley-on-Thames.

GARDENER (Single-handed), or with help.—A GENTLEMAN wishes to recommend an experienced man as above. Has lived with him six years, and only leaves to be married.—J. GRIFFITHS, Burcher, Titley, R.S.O., Herefordshire.

GARDENER (Single-handed, or otherwise).—Single; good at Grapes, Tomatos, &c. Good reference.—S. WOOLASTON, Baginton, Coventry.

GARDENER (Single-handed, or Second where four are kept).—Age 27, single; disengaged. Twelve months' good character, and two years and a half previous.—F. COLES, Empshott, Petersfield, Hants.

GARDENER (Single-handed).—Age 24, single; good experience in Glass, Flower, and Kitchen Garden. Near London preferred. Excellent references.—W. A. BUTCHER, near Andover, Hants.

GARDENER (thorough good Single-handed, or otherwise).—Age 32, married, one child; understands Vines, Cucumbers, Melons, Tomatos, and Flower and Kitchen Garden.—S. W., Leslie Road, Dorking.

GARDENER (Single-handed), or where help is given.—Age 28, single. Fourteen years' experience in Growing Flowers, Fruit, and Vegetables; two years and six years previous good character.—C. GIBBONS, 24, Brayard's Road, Peckham, S.E.

GARDENER, where help is given.—Age 26, single; well up in all branches, Inside and Out; well recommended; good references.—W. TURNER, Church Fields, West Malling, near Maidstone, Kent.

GARDENER; age 30.—Mr. J. PARK, West Mount, Barrow-in-Furness, wishes to highly recommend his good all-round man to any Gentleman requiring same.

HOLLOWAY'S OINTMENT and PILLS.—Sudden changes of temperature sorely try all persons prone to Rheumatism, Sciatica, Tic doloreux, and many malacies scarcely less painful, though of shorter duration. On the first attack of stiffness or suffering in any muscle, joint, or nerve, recourse should immediately be had to fomenting the seat of disease with hot brine and rubbing in this remarkable Ointment, which will assuage the uneasiness of the part, subdue inflammation, and reduce the swelling. The Pills, simultaneously taken, will rectify constitutional disturbances and renew the strength. No remedy heretofore discovered has proved so effective as the Ointment and Pills for removing Gouty, Rheumatic, and Scrofulous attacks, which affect all ages, and are commonly called hereditary.

GREEN'S PATENT "SILENS MESSOR" AND "NEW MONARCH"

ROLLING AND COLLECTING MACHINES FOR 1893.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in **constant** *use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.*

Patronised by— They are the first, foremost, and best in the world.

HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS.
The Late EMPEROR OF THE FRENCH. The EMPEROR OF RUSSIA,
And most of the NOBILITY, CLERGY, and GENTRY of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The *"Journal of Horticulture," of June 9, says:*—"MOWING MACHINES.—After a critical examination, the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 195,000 of these Machines have been Sold since they were first introduced in the year 1856,
And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.
They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

SINGLE-HANDED SILENS MESSOR LAWN MOWER, With Improved Steel Chains and Handles.

To cut 6 in., can be worked by a Lady ...	£1	15	0
To cut 8 in., do. do.	2	10	0
To cut 10 in., do. by a strong youth	3	10	0
To cut 12 in., do. by a man ...	4	10	0
To cut 14 in., do. do. ...	5	10	0

We are the only makers of Lawn Mowers appointed by Royal Warrant to Her Majesty the Queen, and His Royal Highness the Prince of Wales.

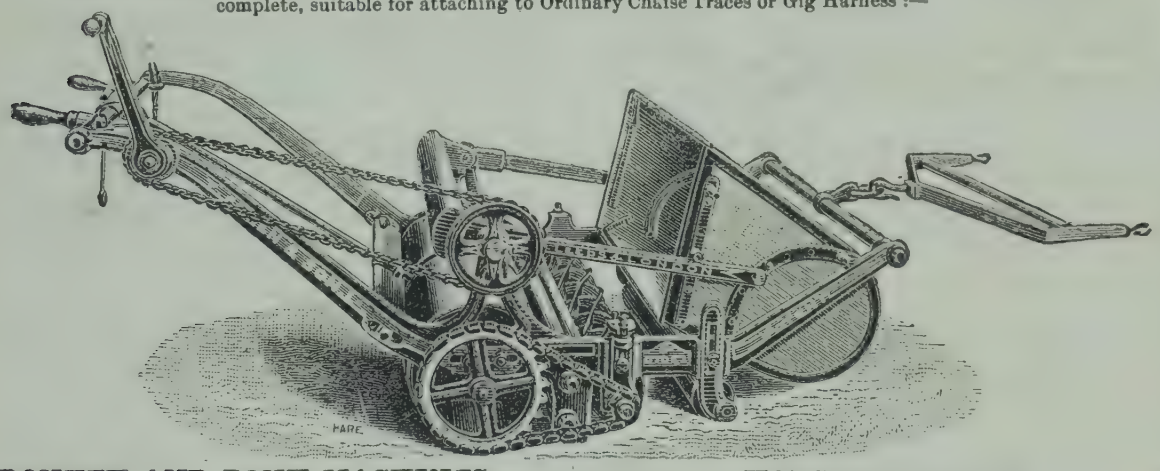
DOUBLE-HANDED LAWN MOWER.

To cut 16 inches, can be worked by one man on even lawn ...	£6	10	0
To cut 18 inches, do. man and boy...	7	10	0
To cut 20 inches, do. do. ...	8	0	0
*To cut 22 inches, can be worked by two men	£8	10	0
*To cut 24 inches, do. do. ...	9	0	0

* If made stronger, suitable for Donkey, 30*s.* extra.

These Mowers are the "Ne Plus Ultra" and "Acme" of perfection of all Lawn Mowers extant.

Prices of Donkey, Pony, and Horse Machines, including Patent Self Delivery Box, or Side-delivery, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness :—



DONKEY AND PONY MACHINES.

To cut 26 inches	£14	0	0
To cut 28 inches	16	0	0
To cut 30 inches	18	0	0
Leather Boots for Donkey	1	0	0
Leather Boots for Pony	1	4	0

HORSE MACHINES.

To cut 30 inches	£22	0	0
To cut 36 inches	26	0	0
To cut 42 inches	30	0	0
To cut 48 inches	34	0	0
Leather Boots for Horse	1	9	0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the machine. Packing Cases as per List, except when for export.

THE AMESTREY COURT
COLLECTION of ORCHIDS.

IMPORTANT UNRESERVED SALE of this valuable and well-known Collection of Orchids, by Order of the Proprietor, Colonel Robinson, who is leaving his residence, Amestrey Court, Woolton, Liverpool.

This valuable and well-known Collection of Orchids will be offered for SALE by AUCTION, on the Premises, without the least reserve, on FRIDAY, APRIL 28, at 11 o'Clock prompt.

The fine Collection of STOVE PLANTS will also be offered at the same time.

This Collection of Orchids is well-known in the neighbourhood of Liverpool, and has a high reputation for the excellent state of cultivation. Numerous prizes have been obtained at the Liverpool exhibitions, by well-known specimens in the Collection, and many of the plants have been noticed and commented on in the Horticultural Press. Each section is well represented, and the Collection is well worthy the attention of Orchid connoisseurs. The Collection can be inspected any day prior to the Sale on application to the Head Gardener.

Catalogues are now ready, and will be forwarded post-free on application to—

MR. JOHN COWAN,
THE VINEYARD, GARSTON, NEAR LIVERPOOL.

DOBBIE & CO., ROTHESAY.

AN ENTIRELY NEW TYPE.—SINGLE CACTUS DAHLIAS.

THE BEST OF ALL for CUT FLOWERS and DECORATION.

Exhibited by us before the ROYAL HORTICULTURAL SOCIETY on September 20, 1892.

At the beginning of the Season we offered a set of eight varieties of our New Single Cactus Dahlias, but we are now fully booked for whole sets. We can, however, supply half sets, consisting of the following four varieties:—

ALTHEA.—Deep glowing crimson; petals twisted and recurved; the flowers standing erect on stiff stalks. A gem for epergnes and table decorations. Height, 3 feet.

GUY MANNERING.—Creamy white with sulphur shading towards the centre; long, twisted petals. Very graceful and free flowering. Height, 4 feet.

MAID OF BUTE.—Soft rose colour; long and flat petals, twisted at the point; a brown disc round the centre gives the flower a distinctive and attractive appearance. Height, 2 feet.

MEG MERRILEES.—Beautiful, clear yellow petals, large and twisted slightly incurved. Height, 3½ feet. A most charming flower.

The four varieties post-free for 10s. 6d. **Fine plants ready May 1.**

In 1885 we grew no Dahlias. In 1892 we sold 50,000. This fact is a sufficient guarantee that both plants and varieties pleased.

Sample Dozen of SHOW and FANCY DAHLIAS post-free for 4s. 6d.

Canary Bird, Coronet, Ethel Britton, Goldfinder, Henry Walton, Mrs. Gladstone, Mrs. Langtry, Wm. Rawlings, Buffalo Bill, M. Campbell, Prince Henry, and Rev. J. B. M. Camm.

Sample Dozen of CACTUS DAHLIAS. post-free for 4s. 6d.

Asia, Beauty of Arundel, Cannell's Favourite, Duke of Clarence, Empress of India, Harry Freeman, Honoria, Mrs. Hawkins, Marchioness of Bute, Oban, Panthea, and Professor Baldwin.

Equally good value given in POMPONES or SINGLES, or Customers can have mixed dozens if desired.

Buyers can have the plants now to grow on under glass, or they can have them early in June ready to plant out. Please give instructions when ordering.

VIOLAS.—VIOLAS.

Our Collection is well known to be the largest and most complete in Europe. Every variety worth growing is included in it, and very many good sorts are not to be found elsewhere.

One dozen very fine standard varieties .. .. 2*s.* 6*d.* Post free.	100 in 12 Bedding varieties .. .. 15*s.* Carriage paid.
100 in 50 Exhibition varieties.. .. .. .. 20*s.* Carriage paid.	1000 in 25 Bedding varieties .. .. £6 Carriage paid.

JOHN LAING AND SONS, Begonia Growers, &c., Forest Hill.

ALL MUST HAVE

THE LATEST NOVELTY IN CHRYSANTHEMUMS—

"CHARLES DAVIS,"

The most magnificent Chrysanthemum in existence. Golden sport from the immensely popular Viviand Morel. Canary-yellow, most beautifully tinted rosy-bronze.

H. J. JONES has great pleasure in announcing that he has concluded the purchase from Mr. N. Davis of one-half of the entire stock, estimated at about 500 plants, which will be ready early in May. Though late in the season to introduce this novelty, it is of such a free-flowering nature that good exhibition blooms can be secured from these plants, but as some will necessarily come ready before others, early Orders will receive the best plants.

Price 6s. each; 3 for 15s.; 6 for 27s. 6d.

No further trade reduction from these prices. Orders will be executed in rotation, and in case of insufficiency of stock, Cash Orders will receive priority.

H. J. JONES,

RYECROFT NURSERY, HITHER GREEN, LEWISHAM, S.E.

BOUVARDIAS.—Strong young Stuff, well-rooted, fit for potting, in 12 best-named sorts, including the grand new White Paniculata jasminoides, Flavescens, fl.-pl., Neuner, Garfield, Cleveland, &c., 2*s.* 6*d.* per doz., 12*s.* 6*d.* p. 100.
NEW WINTER-FLOWERING CARNATIONS, REDUCED PRICES, to clear, good stuff, ready for potting; La Neige, most profitable white for winter bloom, 4*s.* per dozen, 15*s.* per 100; Winter Cheer, best scarlet, 4*s.* per dozen, 15*s.* per 100; Mrs. Moore, largest white, 4*s.* 6*d.* per dozen, 16*s.* per 100; Miss Joliffe Improved, by far the best pink Carnation for winter-flowering, 20*s.* per 100, 4*s.* 6*d.* per dozen; Andalusia, best yellow, 4*s.* per dozen, 15*s.* per 100. In variety to name, 4*s.* per dozen, 15*s.* per 100. Mrs. A. Hemsley, new large crimson, F.C.C., 5*s.* per dozen. For cash only.
CRANE AND CLARKE, Hillside Nursery, March, Cambs.

NEW ROSES FOR 1893.

H.P. PAUL'S EARLY BLUSH.
H.P. CHARLES GATER.
RUGOSA AMERICANA.

PAUL AND SON are now booking orders for their fine Cheshunt-raised Novelties. LIST on application.

HARDY HERBACEOUS PLANTS, AMARYLLIS, and CANNAS.

These are finely in flower at the Cheshunt and Broxbourn Nurseries of the Firm.

THE OLD NURSERIES, CHESHUNT, N.

Borough of Wolverhampton.
TO LANDSCAPE GARDENERS and OTHERS.
THE PARK and BATHS COMMITTEE INVITE DESIGNS for LAYING OUT the proposed EAST END PARK of about 50 Acres in extent. A lithograph plan and printed general instructions and conditions may be obtained from the Borough Surveyor, Town Hall, on payment of one guinea, which will be returned on receipt of a *bonâ fide* design. The Committee offer a premium of £50 and £25 for the best and second best designs respectively. Designs, accompanied in each case by specification and detailed estimate under Motto, and addressed to the Chairman of the Park and Baths Committee, must be left at the Town Clerk's Office, on or before Saturday, June 24, 1893.
THE PUBLIC WORKS COMMITTEE are desirous of receiving DESIGNS for LAYING OUT a PIECE of LAND situate between the Art Gallery and the Birmingham and District Bank, Lichfield Street. The Committee offer a premium of £10 for the best design. Particulars may be obtained from the Borough Surveyor. Each design, accompanied by a specification and estimate under Motto, and addressed to the Chairman of the Public Works Committee, must be left at the Town Clerk's Office, on or before June 24, 1893.
The Committees do not bind themselves to select any design.
HORATIO BREVITT, Town Clerk.
Town Hall, Wolverhampton, April, 1893.

JOSEPH MEREDITH, LANDSCAPE GARDENER and GENERAL HORTICULTURIST, Snape Hall, Whitmore, Newcastle, Staffordshire.
N.B.—Winner of our own Queen's Cup at the International Exhibition at Hamburg; Gold Medals in Paris, Brussels, Holland, &c., and the leading prizes for Grapes for many years in Great Britain and Ireland.
Author of a work on the Grape Vine.

ORCHIDS.—New and rare species, a special feature. Catalogue forwarded post-free on application.
SEEGER AND TROPP, Ltd., Orchid Nursery, East Dulwich, London, S.E.

BEGONIAS, of superb quality, for Bedding, Greenhouse, or Exhibition. See the "best" Begonia Catalogue published free, from—
B. R. DAVIS, Begonia Grower, Yeovil Nurseries, Yeovil.

F. V. RASPAIL GERANIUM, well-rooted Cuttings, out of store pots, £3 per 1000, or 7*s.* per 100. Cash with order.—P. BOULTON, Beechenlea Nursery, Swanley.

SUPERB ORCHIDS, CHEAP.—Thousands to select from. Write for List, free.—P. MCARTHUR, The London Nursery, 4, Maida Vale, London, W.

To the Trade.
SEED POTATOS.
H. AND F. SHARPE have still to offer all the best kinds of SEED POTATOS, grown on their own farms, from fine selected stocks. Special prices may be had on application.
SEED GROWING ESTABLISHMENT, WISBECH.

ADIANTUM CUNEATUM, fine stuff in 48's. Carter's Model TOMATO, strong plants in 60's, cheap.
JOHNSON AND CO., Tangley Park Nursery, Hampton-on-Thames.

SWORDER'S never-failing Virgin MUSHROOM SPAWN, always yielding a heavy crop. 4*s.* 6*d.* per bushel, or 4*d.* per brick; free per post, 8*d.*
J. C. SWORDER, Buntingford.

SHILLING'S EXHIBITION GLADIOLI.—The finest extant. Reports from all parts of the Kingdom are highly satisfactory, many Prizes having been won with blooms against strong competition. The colours include fine White, Yellow, Maroon, Crimson, Lilac, whilst some are beautifully variegated. Exceptionally fine bulbs, in splendid mixture, 2*s.* per dozen, 15*s.* per 100; light and white shades only, 2*s.* 6*d.* per dozen; 12 finest named Gladioli, in 12 varieties, 5*s.*; 6 for 2*s.* 6*d.* Carriage paid.
C. R. SHILLING, Seed Grower, Winchfield, Hants.

NEW COLEUS, "DISTINCTION."

INTRODUCED 1892.
To the Trade, 9s. per dozen, in Small Pots.
This is undoubtedly the finest introduction in the way of Coleus yet announced, and will prove a most valuable acquisition for Bedding or Decorative Purposes, the foliage being of a striking reddish rich maroon, and darker in colour than any other variety; it is also of a very sturdy growth, and hardy character.
Award of Merit from the Royal Horticultural Society, August 22, 1892.
J. A. MORRIS, Nurseryman, Church Road, Acton, W.

Established 1810.
"HARTLAND," SEEDSMAN, Patrick Street, Cork, Ireland.
Write for "YEAR BOOK of RARE SEEDS for 1893."
Tomatos and Daffodils a great feature in this establishment.

DAFFODILS AND OTHER SPRING FLOWERING BULBS.
ACRES OF BULBS.—Many varieties now in full splendour of bloom. Specimen Blooms sent for selection of sorts if desired.

THE IMPROVED GARDEN GULLY

(VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

6-in., 1*s*. 6*d*.; 8-in., 2*s*.; 10-in., 3*s*.; 12-in., 6*s*. 6*d*. 15-in., 8*s*.

(*The larger sizes are very strong for carriage drives.*)

NOVELTIES.

F. SANDER & Co.,

ST. ALBANS.

RANUNCULUS CORTUSÆFOLIUS

(THE GIANT BUTTERCUP).

A veritable giant Buttercup, growing 3 feet high, and highly effective, producing dense clusters of lustrous yellow blossoms; foliage of noble proportions. Good Plants, 5*s*. each; 50*s*. per dozen.

ARISÆMA FIMBRIATA

(THE COBRA-HEADED ARISÆMA).

A superb and remarkable Aroid, with enormous trilobed leaves, flowers resembling the head of a Cobra di Capella, or a gigantic Sarracenia with a long tapering lid. A truly extraordinary and magnificent rarity. Fine Tubers, 7*s*. 6*d*. each; 75*s*. per dozen.

GLORIOSA SUPERBA

(THE CLIMBING GLORY LILY).

Flowers Crimson, Gold, and Emerald.

Fine Tubers, 1*s*. each; 10*s*. per dozen.

ANGRÆCUM FOURNIERIANUM, Sander.

The finest new Angræcum we have as yet introduced. Flowers pure White, half the size of A. sesquipedale. Up to twenty flowers on a spike.

Price on application.

ALOCASIA WATSONIANA

A noble species from Sumatra, with large shield-shaped leaves, beautifully reticulated with a network of silvery marbled tracery on a purplish claret-coloured ground. This formed one of the six new plants with which we won the 1st Prize at the Ghent International Show last week. Price on application.

THE

Gardeners' Chronicle.

SATURDAY, APRIL 22, 1893.

TANGLEY MANOR.

THE date on this interesting manor-house is 1582. I remember it as a farmhouse. Its present owner and restorer is Mr. Wickham Flower. In the reign of King John a still more interesting house bearing the same name stood on the spot. According to a work of great local fame and interest by the late Martin Tupper, the greatest character and statesman of John's reign, Stephen Langton, was born in humble life in the adjacent village of Aldbury. At about the age of twenty the young man had met his sweetheart at a retired spot, well known in the neighbourhood as "Albury Hanger. Prince John came riding by at the head of a hunting party, a dissipated and contemptible prince, and a lawless crew. After a brief parley the ruffians rode off with the girl to Tangley Manor. I must hurry over this ancient history in order to overtake the excellent modern gardening at the manor-house, but for the sake of the associations connected with the old place, I may add that Stephen Langton, the future archbishop, followed the ravishers, and most courageously effected his object of depriving them of their prey. In doing so he set fire to the house, which was burnt to the ground. The future career of the young couple, how their marriage was prevented, how he became an archbishop, and she a prioress, must not detain us. The house was rebuilt, as already intimated, in the time of Queen Elizabeth, and it is one of the most picturesque of Elizabethan manor-houses in the county of Surrey, where they abound. The moat surrounding it, supplied as it is by a bright stream from that principal source of rivulets in this district, Leith Hill, is now one of the most striking features of the place. It surrounds the house, and divides the 8 acres of lawns, orchards, gardens, and shrubberies into an outer and inner space. A wide margin of lawn and garden intervenes between the moat and the gabled house. The front garden is enclosed with a wall having wide open spaces along the margin of the moat, so that the view from the windows may not be closed. Here stood the strong gateway of the feudal manor-house, and, interesting as such objects are, its removal must have greatly improved the outlook from the windows. An enclosed garden necessarily limits the view, but this is characteristic of a moated manor-house built on low ground for the sake of the water supply, and the defect has been remedied as far as possible by the wide openings in the front wall; and by another notable display of good taste, the garnishing of the whole of this enclosing wall with numerous bunches and hanging bits of greenery, such as Arabis, Saxifrages, Campanulas, Pinks, Wallflowers, and many others.

*

Having crossed the moat by one of its bridges, and reached the outer garden, one may wander round an ornamental lakelet, fed by the same stream, which now runs through the moat. It will be understood that, on a low site like this, it is desirable to diminish rather than increase the extent of stagnant water. The moat, therefore, is not now kept full. With the exception of a narrow channel for the water, its bottom has been levelled and turfed over, and its sides sloped and covered with grass, so that the moat as modernised has a very charming appearance. Returning to the lakelet, we find on its pleasant banks, what may be said, in fact, of Tangley Manor as a whole, a cool retreat in summer. The Myosotis palustris grows abundantly on the banks, numerous Water Lilies blossom in their season on the surface of the water, including Nymphæa alba and N. lutea, and a much less handsome North American Water Lily, Nuphar advena. Flags and reeds abound here too. The special features of the grounds are the alpine garden and the Bog plants, which are grown generally by themselves in a low damp site. Early blossoms abound, and as my visit fell on a bright sunny day in March after a long period of rainy and gloomy weather, the early blossoms shone bright in the sun. There were innumerable patches of blue, white, and yellow Crocuses on the grass, and long lines of them bordering the walks. Primroses, Aconites, and Scillas abound, and under the wall of the house is a fine patch of Iris reticulata. Among other blossoms I must not omit the patches of Violets, the Snowdrop, the Polyanthus, the Skimmia japonica, whose red berries may stand for blossoms in this list, being quite as gay, and to these may be added Daphne Cneorum, whose pink flowers were just coming out.

Another section of the garden would supply a long list of other flowering plants if we had space to give the name of all. In forming the alpine garden, the sandstone rock of the immediate neighbourhood, taken from the strata of the lower green sand, was found useful. The colour of this stone is particularly pleasing to the eye, and when plenty of it is used, and well piled up in lumps and crags above the soil, with the alpines growing in the spaces between the stones and in the crevices of the rocks, the appearance of the rockwork is then very handsome indeed. I took the liberty of mentioning to Mr. Whiteman, the excellent gardener at Tangley Manor, that I thought the alpine garden, with its many tons of capital stone buried beneath the surface, a little too smooth in outline. The rockeries in some of the park gardens in London or its suburbs, especially at Dulwich Park, are admirably constructed, but it cannot be said that clinkers and similar materials can compare in beauty with the sandstones of Surrey.

Mr. Whiteman is a genuine lover of flowers, and he has collected in the alpine garden a large number of specimens. Naming them as we happened to meet with them, there are the blue, white, and pink Hepatica; the Linaria hepaticæfolia, a compact dwarf, not more than an inch tall, and not to be in bloom till July; perhaps the most conspicuous of the earlier blossoming plants were three Saxifrages, namely S. oppositifolia superba, S. o. splendens, and S. o. maxima, with a white variety of the same—great batches of these were in blossom, and they are as handsome as their names betoken. Near these were Chionodoxa Luciliæ, with superb blue flowers, having white centres. Another of the early-blooming plants which make this garden gay in the early spring-time, is the Grape Hyacinth; Muscari botryoides pallidum and M. racemosum, with several other species, together with the rarer M. Heldreichii. Gentiana acaulis grows here in abundance, and large healthy-looking cushions of it were just putting up their flower buds. Draba bœotica, a native of our northern mountains, had just put forth its yellow blossoms on March 8, and large heads of blossoms they are for so small a plant. Campanula pulla, the Ligurian Hairbell, one of the prettiest dwarfs of that order, not more than 2 or 3 inches high, was just appearing above the ground. Lewisia rediviva, the Resurrection Plant, was expected to blossom in six weeks, and before that time the scanty foliage would have died down, falling before the blossom appears, to be renewed next year. Side by side were Aralia alpina in blossom, and the Greek Crocus of the Ionian Islands, with its fine leaves and beautifully-marked flowers. Thymus in variety were spreading wide over the rocks and coming into blossom, and the former would shortly be a sheet of scarlet.

Passing by many other alpines which are not yet in blossom, including the mossy Saxifrages, bright and green, we reached, in the course of our ramble, the bog garden. This, however, is not a bog, though it is rather a damp spot; the plants are not all aquatics, but such as do best in damp places. The surface is unlevel, so that there are drier banks above the damp hollows. Primula grandiflora rosea is a plant which prefers to have its feet in the water and its head in the hot sun, and it flourishes here, and produces its bright crimson blossom in just such a site as it loves. On a suitable site on the drier bank above are Primula Sieboldi, P. Cashmeriana, and P. japonica. Hellebores evidently find here a suitable soil, for they flourish amazingly. Among them are H. guttatus, H. abchasicus, H. olympicus, and H. caucasicus punctatus, which last has reddish-purple flowers, spotted internally with dark purple. The plant described in Mr. Ware's catalogue of hardy perennials, alpine plants, &c., as H. colchicus, a rare Caucasian species, was, like the others, in blossom. Heuchera sanguinea had already put up its vivid crimson flowers. In a damper site was growing that handsome plant for bogs or water-sides, Bambusa Metake, with tropical-looking evergreen foliage. Cypripedium spectabile, the Lady Slipper, or Mocassin flower, must be named, though not in blossom. This hardy Orchid is seen in great splendour here in its season. Libertia, a species of sedge, was in flower by the water-side. Dwarf Azaleas and Rhododendrons grow thickly in the neighbourhood of the bog garden, with Genista hispanica, and numerous Heaths. Nothing could exceed the beauty of Erica carnea and E. alba. Gaultheria nummularioides, with its mass of creeping arching stems, grows freely in the peaty soil. Andromeda tetragona, a Heath-like shrub, with quadrangular shoots, and Daphne Mezereum alba, sweet and bright, were not far off. I may add to this long list clumps of Erica carnea alba, one of the brightest of green plants, covered with small white blossoms, with the characteristic bunch of brown stamens protruding from the flower. A coming blossom is Waldstenia fragarioides, a bright green creeping thing, with yellow blossoms just about to open.

Among the alpines should be named that charming spring flower, Omphalodes verna, with brilliant blossoms of an exquisite blue colour, like those of the Forgot-me-Not, and 6 to 9 inches high. This plant prefers a sheltered corner, loving shade and the protection of trees.

In the alpine-house, where the blossoms are a little forwarder than they are out-of-doors, we found Gentiana acaulis in full bloom, with a number of others, including Primula glaucescens, P. nivalis, P. marginata, P. Allioni, Ranunculus anemonoides, Saxifraga Burseriana major, Soldanella alpina, Androsace carnea, Saxifraga Juniperiana, and Lithospermum graminifolium. Among several other favourites here, Androsace Chamæjasme, one of the best alpines, will soon be in blossom. *H. E.*

GHENT QUINQUENNIAL NOVELTIES.

(*Continued from p.* 442.)

HORT. LINDEN.

1. *Eulophiella Elisabethæ*, Rolfe.—This fine African Orchid, for which a new genus has been created, has a most elegant habit. Its flowers, borne in clusters of twenty on a purplish-red stem, are white flushed with rose, and look like porcelain; they are rounded in form, a little suggestive of those of Odontoglossum citrosmum, and are of the same size as that species. The hinder surface of the segments is purplish-red, the callus of the lip is orange-yellow. (Figured in *Lindenia*, pl. 329.)

2. *Tradescantia reginæ*, Lind. and Rod.—A very elegant plant, leaves variegated with rose-coloured purple and green stripes on a whitish ground. First-class Certificate at the Temple Show, 1892. (*Illustration Horticole*, xxxix., pl. 147.) (See fig. 71, p. 477.)

3. *Smilax argyrea*, Lind. and Rod.—A charming species, with long acuminate leaves, irregularly marked with silvery-white. First-class Certificate at Temple Show, 1892. (*Ill. Hort.*, xxxix., pl. 152.) (See fig. 70, p. 475.)

4. *Hæmanthus Lindeni*, N. E. Brown.—This is a fine Amaryllid from the Congo. It bears flowers nearly 2 inches across in fine rounded umbels, from $5\frac{3}{4}$ to nearly 8 inches across. The blooms are rosy-salmon tinged with scarlet. (*Ill. Hort.*, xxxvii., pl. 112.) (See fig. 73, p. 483.)

5. *Tradescantia superba*, Lind. and Rod.—A fine species, with foliage variegated with clear green and silvery-white on a bright green ground. First-class Certificate at Temple Show, 1892. (*Ill. Hort*, xxxix., pl. 199.)

6. *Stenandrium Lindeni*, N. E. Brown.—A species with compact foliage, dull green, with clear yellow veins, and a pale yellowish-green edge. First-class Certificate at Temple Show, 1892. (*Ill. Hort.*, xxxviii., pl. 136.)

7. *Labisia smaragdina*, Lind. and Rod.—A dwarf plant with excellent foliage, olive-green, with darker veins. First-class Certificate at Temple Show, 1892. (*Ill. Hort.*, xxxix., pl. 160.)

8. *Cyrtosperma ferox*, Lind. and N. E. Br.—A very decorative Aroid, with hastate leaves of considerable length; the petioles and floral peduncles thorny, petioles marbled with dark rose. Botanical Certificate at Temple Show, 1892. (*Ill. Hort.*, xxxix., pl. 193.)

9. *Dieffenbachia meleagris*, Lind. and Rod. An Aroid. Leaves spotted with ivory-white, and petioles much variegated with the same colour. (*Ill. Hort.*, xxxix., pl. 159.)

10. *Peperomia metallica*, Lind. and Rod.—An elegant species with dark green leaves, variegated with metallic, greenish, and whitish tints. (*Ill. Hort.*, xxxix., pl. 157.)

11. *Cupania elegans*, Lind.—A species with light and graceful foliage, leaves undulated, and toothed at the edges.

12. *Tradescantia elongata*, Lind.—A species of good habit, leaves longer and narrower than in T. reginæ, dark green with bands of silvery-white, and a dull purple tinge down the mid-rib.

13. *Dichorizandra musaica gigantea*, Lind. and Rod.—A fine plant of luxuriant growth, leaves very broad, nearly circular, the whole marbled with yellowish-white on a dark green ground.

14. *Heliconia spectabilis*, Lind. and Rod.—Very graceful in habit and colouring, petioles rosy, striped and speckled with brown, the leaves elongate-lanceolate, brilliant green with a rose-coloured mid-rib, the lower surface purplish-brown. (*Ill. Hort.*, xxxix., pl. 156.)

15. *Begonia Lansbergii*.—A splendid species. Habit compact, leaves obcordate acuminate, dark green above, tender green and softly velvety below.

16. *Dieffenbachia olbia*, Lind. and Rod.—A species of full and stately habit owing to the rich markings of the leaves, blotched with yellow and narrowly striped with white on both sides of the mid-rib. (*Ill. Hort.*, xxxix., pl. 148.)

17. *Bolbophyllum tesselatum*, Lind. — A small species with a creeping rhizome, the foliage prettily marked with fine whitish-yellow stripes on a green ground.

18. *Phyllogathis ciliata*, Lindl.—An interesting species, with rounded emerald-green leaves, the petioles covered with long hairs.

19. *Tradescantia velutina*, Lind. — Bears close short leaves, shaded with violet-purple in the centre, with a narrow silvery band on either side near the tip, and covered with very fine hairs.

20. *Calamus gracillimus*, Lind. — Foliage very narrow, linear, elongated, spaced at wide distances apart. A graceful Palm.

21. *Caladium sagittatum*, Lind. and Rod.—Foliage narrow, arrow-shaped at the base, dark green, with a wide band of bright red along the midrib, branching irregularly through the blade. (*Ill. Hort.*, xxxviii., pl. 138.)

22. *Alocasia coriacea*, Lind.—Leaves dark green, with clear green ribs, and looking like shining leather. The petioles, rose-coloured when young, then rosy-white, are delicately marbled with green.

23. *Dichorizandra angustifolia*, Lind. and Rod.—A very graceful species, rather suggestive of D. musaica, but the leaves are narrower, and more elongated; the lower surface beautiful violet purple. (*Ill. Hort.*, xxxix., pl. 158.)

24. *Cyanophyllum aspersum*, Lind.—A plant of great beauty, suggesting C. magnificum, but the leaves are more elongated, coated with a most delicate down, which gives it a beautiful velvety texture.

Fig. 70.—SMILAX ARGYREA: HORT. LINDEN. (see p. 474.)

SPRING FLOWERS.

Although the first flush of spring, with all its cheery tidings is over, yet is there now, in this late part of March, a gladdening display of lovely and brilliant flowers—and what a March it has been—at any rate with us in East Kent! It is true we have had some sharp frosts at night, but there has been no rain, and consequently I have never seen our early spring flowers lasting so long in their beauty as this year. No snow-storms, no drenching rains or howling winds, brilliant sunshine each day, but also tempered by an easterly wind that prevents flowers from being scorched up, as in some seasons. I know it has been different in other parts of the country, where we hear of frosts of far greater intensity, and of dense fogs, shutting out the bright sunshine, and nipping many a little plant. I think, then, perhaps a few further notes on spring flowers may not be unacceptable to those who, like myself, may have but a small garden, and who would like to know what can be best done to receive gratification from it at this early season; some of the flowers I have already noticed still linger on with me, especially is this the case with Anemone blanda, which even now (March 27) is sending up fresh blooms. I leave these, however, for pastures new.

This hackneyed phrase is used in its actual sense, for I am now looking out on a small paddock in front of my house, which is all aglow with Daffodils, most of them indeed the old-fashioned Lent Lily, but some others have been planted amongst them. There is certainly no way in which these delightful flowers show to so great an advantage as on grass, and the Field of the Cloth of Gold, as we grandiloquently call it, is very pleasing, not only to ourselves, but to our neighbours.

One cannot but be struck at this season in our garden on every side, how much we owe to bulbs, to which I may add, to bulbs of comparatively recent introduction. Thus I think the glory of my garden during the early part of March is my border of Chionodoxa Luciliæ. There is a border in front of my greenhouse 42 feet long, and the Chionodoxa occupies the whole length, and is about 18 inches wide; the other side of the path has also a border of it, but as the plants are seedlings, they are not as yet as strong as the others, which is composed of roots received from Smyrna, but which have spread amazingly since they were planted.

Another very beautiful member of this family, and possibly only a variety, is C. Sardensis; this has a deeper shade of blue, and not so much white in it as Luciliæ; and is, I think, somewhat later in flowering, and not quite so soon out of flower, it is also perfectly hardy, and increases in the manner of the type. Two other varieties, for the possession of which I am indebted to Mr. Whittall of Smyrna, are gigantea (or grandiflora), and Alleni, the former has very much larger flowers than either Luciliæ or Sardensis, and the blue has a decided lilac tinge in it, but my experience of it during the two years I have flowered it is that it produces fewer flowers on the stems than Luciliæ and Alleni I received last year from Mr. Whittall, and therefore can hardly say much about it. It is evidently of the gigantea type, but whether it is so superior as some affirm I doubt; when to these we add the beautiful well-known bulb, Scilla sibirica, and the graceful little S. bifolia, it will be seen how much our spring garden is indebted to this lovely tribe; and the beautiful weather of this March has given them the opportunity of displaying their charms to perfection. In addition to the border of C. Luciliæ already mentioned, I have another about 15 feet long of C. Sardensis, and another of the same length of S. sibirica, so that my little garden is not wanting in the flowers of early spring.

Of Narcissi I shall not say much, for there will be so much written upon them by those who are so much better qualified to write about them, and in truth, in the early days of March, there are but few in bloom out-of-doors. There are, it is true, those pleasing harbingers of the greater harvest, N. Minor and N. Minimus, and that quaint little beauty, Cyclamineus. I notice of this, that it has been said, that as it is found by the borders of streams, it ought to be planted in a damp peaty place. I have two clumps of it, one is in a place as nearly answering to that description as I can find in my sunny garden; the other is in a spot on one of my small rockeries fully exposed to the sun, and I do not see the least difference, they have both grown and both flowered well, so perhaps it is one of those accommodating plants, which may be called "opportunists;" and although preferring some situation like its natural habitat, yet is willing to put up with something very different, like the Trilliums, which, although plants reposing in shady woodlands, do well in our open borders—it is so quaint and attractive that it is

worthy of a place in any garden. I fear that other very pretty variety, N. triandrus, is not quite hardy enough, except in the more southern parts of our islands. Of course, after the middle of the month, plants and bulbs of all kinds come trotting in on top of one another; but I confine myself to those which cheer us before the great wealth of bloom comes in—and here one has to come to the rockeries, be they great or small. Omphalodes verna, or as it is sometimes called, the creeping Forget-me-Not, with its intense blue flowers, suggesting that of the Forget-me-Not, has done especially well this spring.

In looking over the rockery, I am met here and there with gems which, although making no grand blaze, are yet for one reason or another, delightful to the lover of flowers; here, for instance, is a clump of that queer-looking but very pretty flower, Anemone pulsatilla, still, I believe, very abundant in meadows in Bedfordshire and other Midland Counties. Then what a delightful little alpine shrub is Daphne Blagayana, with its dwarf habit and profusion of delicate and sweetly-perfumed flowers; it is generally considered to be a difficult plant to grow, and in some soils not quite hardy; however, it has done well with me, although it has received no particular attention.

Puschkinia scilloides is another very pleasing bulbous plant, with its delicate white flowers shaded with light blue, and another of those hardy gems on which we may rely so safely, provided you can keep slugs from it—a most difficult matter, for they have a peculiar *penchant* for it, as well as for the brilliant Tulipa Greigii, which I have watched with the greatest care, but at which they will get if they possibly can, and with all our watchfulness they beat us.

These are a few of those early-blooming flowers which gladden those who cultivate them up to, let us say, the end of the second week in March. After that there is a rush, Tulips, Hyacinths, and other flowering bulbs, together with Primula, Polyanthus, and other plants, displaying their beauty day after day; and in the wonderful season we have this year, it is rather difficult to say whether we most grieve over the shortness of the duration of these later spring flowers, or rejoice over the clear and bright colouring which the absence of snow and rain gives to them. *Wild Rose.*

PLANTING AND SOWING AT THE PRESENT TIME.

Drought reigns to an unprecedented extent over much of England, and gardeners are finding difficulty in getting seeds sown and seedlings planted out, the ground being hard, dusty, and not easily got into the fine tilth so essential for these operations. Where seeds and plants are arranged in lines, it helps them materially to draw suitable drills, and water them heavily the night before sowing or planting, and if one tablespoonful of nitrate of soda or two of common salt be added to a three-gallon can of water, letting these substances dissolve before distributing the water, the soil will be kept in a moist state for a longer period than would be the case when these are omitted. Large and deep drills for plants of Cauliflowers, Cabbages, &c., and wide shallow ones for seeds of Beans, Peas, and Turnips, may be watered with a sort of rose which does not spread the water about, and small drills with a small-spouted can. In the case of seeds, and some kinds of plants, a small quantity of the dry soil should be drawn in over the soil after planting and sowing to retain the moisture, which it does very effectually. Where water is supplied to the garden by means of underground pipes, it is a much easier matter for the gardener, enabling him to use it in the manner above described, or, instead, well saturating the soil all over. Beds of fine seeds, as Radish, Lettuce, Cress, Chervil and herbs generally, Celery, and annual flowering plants of many kinds, should be first watered, then, when dried a little, raked down to a fine tilth, again lightly watered, and the seed sown, and those seeds which are not too fine to be covered should have the required depth of fine dry soil sifted or spread over them, and afterwards be lightly patted with the spade or a bit of smooth board. Where mats can be spared, they may be used over these beds whilst the weather remains dry, but removing them at the very first sign of germination. In the case of lines of seeds, hurdles may be used on one side of the rows, when the sun will shine only half the day on the ground so shaded, or they may be laid flat on the soil. Branches of evergreen trees answer the same purpose, especially those of the Spruce Fir. It should be remembered that all plants so raised must not lack water after growth has begun, or they will be in a worse case than others which may have had to take their chance from the first, and failing abundant rains, artificial watering will be a necessity. Not only in the flower and kitchen gardens must watering receive attention, but the hardy fernery and rockery will ere this be suffering from want of moisture in the soil. Hyacinths, Tulips, Narcissus, Saxifrages, Sedums, Wallflowers, Arabis, Daisies, and the hundred-and-one plants used in spring and summer effects in the flower garden will need, and be greatly benefited by an occasional thorough watering. Violas and Pansies, Primula acaulis, P. polyanthus, P. Sieboldi and others, Hepaticas, especially the first two, will need great attention, or they will do no good this season. [Since the above was written rain has fallen in some parts. Ed]

TREES AND SHRUBS.

HYPERICUM MOSERIANUM.

It would be interesting to know how this new hybrid has fared where planted out in exposed situations. With me, it seems more tender than either of its parents, H. patulum and H. calycinum, which are both more or less tender here. Three or four plants planted out last spring were all killed in January, the minimum temperature up to this date having been 9° Fah. on January 4. H. patulum, though killed nearly to the ground, grows up again like a Fuchsia, and flowers in the autumn; but H Moserianum is killed to the roots beyond recovery. *C. Wolley Dod, Edge Hall, Malpas.*

Viburnum plicatum.

Before the season for planting shrubs is over, a note may be made of this fine dwarf shrub. It is a native of China, quite hardy. The growth is spreading, dwarf, and vigorous, and a large group of it is most effective. When a healthy shrub is in full bloom, the wrinkled leafage, of the deepest green colour, is almost hidden with the wealth of globular clusters of white flowers. Although not common in gardens, it is getting better known; but, unfortunately, it is considered by many too tender for our climate. This is happily a mistake. Sometimes one sees it against a wall, but there is not the slightest need for such shelter. The corymbs of flowers are succeeded by small black berries. *V. C.*

Varieties of Daphne Mezereum.

One of the few shrubs in flower lately was D. Mezereum and its varieties, of which there are two large beds in the Royal Gardens, Kew, that have flowered. It is when thus planted that their value for making a rich break of colour is seen, every twig being covered with the fragrant rose-purple flowers. The effect is made richer if the surface of the bed is planted with Ruscus as at Kew, or the crimson-berried Gaultheria procumbens, which should be lifted once in about three years to succeed well. There are several varieties of this Daphne. The white variety, which is even more floriferous and quite as beautiful as the type, was in bloom at Kew, also rubrum, the flowers of a rich purple shade. The double-flowered species, and D. autumnale may be noted. The two best are D. Mezereum, and the white variety of it for contrast's sake. Almost any soil suits the Daphne, but an open situation is necessary for a perfect ripening of the growth, without which flowers are few. *V. C.*

Erythrina Crista-galli.

This sub-tropical shrub, if planted in sheltered yet sunny situations, and where water will not lodge about the roots at any time, will survive the winter in this country if it be mulched with a layer 3 inches thick of fine coal-ashes. From seed sown now in a pot or pan filled with light sandy soil, and covered with a quarter-inch in depth of the same, placed in heat and watered, nice little plants may be raised by the autumn, and which will yield some flower twelve months later. The young plants should be potted into 3-inch pots when 2 inches high in a compost of three parts good loam and one of leaf-mould and sand, returned to heat, and watered, admitting air sparingly at first. The plants should be shifted into larger pots as they grow, planting them out in June, or standing the pots on coal-ashes. Young shoots taken with a heel from old plants started in a mild heat in the spring or early summer, and inserted in sandy loam on a mild bottom-heat 75° to 80° will strike readily. For the first years of the life of an Erythrina better progress is made if the plants are kept under glass—a cold frame well exposed to the sun—the growth becoming then well matured at the lower part. Young plants should not be cut back till some signs of growth renewal are visible, nor must the drying-off be so severe during winter, as may safely be followed out with old root-stocks. It is a good plan with these small plants—seedlings or those raised from cuttings, to plunge the pots in a large box of damp sand, and keep them in the greenhouse, or on the floor of cold but frost-proof pits. *H. W. W.*

GREENHOUSE RHODODENDRONS.

During the last few years many beautiful garden varieties of Rhododendrons have been raised, which were supposed to be of the R. javanicum type, a beautiful species sent over by Mr. Thomas Lobb from Java, when collecting for Messrs. Veitch. It is figured under that name in the *Botanical Magazine*, t. 4336, and has large trusses of orange-coloured flowers, faintly marked with red spots. Sir Joseph H. Hooker has recently stated that this name is an error, that it is not R. javanicum, but R. Leysmanni; both species have been found in Sumatra and Java, where various other species of Rhododendrons are abundant. It is from R. Teysmanni that so many beautiful garden varieties have been produced. Their rich and varied colours lend a charm to the warm greenhouse such as no other flower can give in the winter season of the year. The best varieties have been described, and their value as winter flowers duly acknowledged, in the pages of the *Gardeners' Chronicle* many times. Messrs. Veitch introduced yet another distinct species from Sumatra, through their collector, Mr. Curtis, which had been named R. multicolor, and, curiously enough, one of the native forms had quite dark red flowers, the other having flowers of a bright yellow. They were both flowered at Chelsea about ten years ago. Since that time, Mr. John Heal has produced a large number of beautiful garden varieties from these two forms of R. multicolor; the varieties were crossed with the garden forms of R. javanicum and R. Teysmanni, for Mr. Curtis also sent from Sumatra a very pretty variety which was named R. javanicum var. tubiflora, and is figured under that name in the *Botanical Magazine*, t. 6850; it has very pretty pale orange-red flowers. Hence there was no lack of material, and Mr. Heal has made the most of it. The great value of this new type of Rhododendron consists in the freedom with which the flowers are produced, even tiny plants in small 3-inch pots producing each three or four trusses. They are also winter-flowering, but, like the better-known varieties, they may be flowered at any time, for one can never visit Messrs. Veitch's nursery at Chelsea without finding some of these Rhododendrons in flower in all the tints of crimson and scarlet, rose and pink, white and cream-coloured, pale yellow to deep orange, orange-red, buff, &c.

At the time of my visit to the Chelsea nurseries, I was shown a variety of this new small-growing type with white flowers, which has been named Mrs. John Heal; the plant was not of large size, but it bore thirty trusses of bloom. Another one, with brilliant scarlet flowers, had been named Neptune. I also observed some seedlings with pale rose-coloured flowers, and others of a deep pink colour.

The original R. multicolor, with deep red flowers, and also the yellow form, are both figured in *Bot. Mag.*, t. 6769, where Sir J. D. Hooker gives a very full account of the Malayan Rhododendrons. It ought to be added that this section, like the more robust group, is easily cultivated, but many people fail by treating them as cool greenhouse plants. What they require is a minimum winter temperature of about 50° to 55°, and a slightly moist atmosphere. When making their growth, the plants delight in the warmth of an intermediate-house; and before they commence to bloom, I place them in the greenhouse, where the blossoms last for a long time—but they are moved to a warm house again as soon as the blossoms pass away. I use nothing but light fibrous peat for them, with good drainage, and they succeed well; but it must be observed that some varieties are more vigorous than others. *J. Douglas.*

Fig. 71.—TRADESCANTIA REGINÆ: HORT. LINDEN. (SEE P. 474.)

SELECT DECORATIVE FOLIAGE PLANTS.

(*Continued from p. 262.*)

There are many beautiful and distinct Palms, but the number of those which have come into general use is limited. Of all the species the Kentias are the most popular at the present day, for in addition to being very effective plants, they withstand hard treatment well. Their cultural requirements are simple, and with ordinary care they will thrive equally well in a cool greenhouse or a stove. Young plants are usually grown on in a high temperature, but it is quite unnecessary, except to force growth; and they should always be well hardened off before being used for ordinary dwelling-house decorations, the plants lasting then well, and even making good growth in a room, provided they get plenty of sunlight. Kentia Belmoreana makes a most symmetrical plant, and the leaves are more recurved and not so coarse as those of K. Fosteriana which is more effective when of large size. Few plants are grown more extensively than these two species of Palms at the present time. Kentia Wendlandi is another fine Palm, with larger leaves and broader leaflets than the two above mentioned. Where only a limited number of Palms are required, it is advisable to purchase young plants rather than to depend upon home-raised seedlings; for the seeds perish quickly, and unless sown as soon as they are received, failure is almost certain.

Cocos Weddeliana is another very popular Palm as a table plant, or when of large size for making groups, when it is very telling. It requires stove temperature, but although a moist atmosphere is beneficial to it, care should be taken that plants are not kept too wet at the roots, as not only this species, but others, frequently suffer through receiving too much water, over-potting and over-watering being a common error in the culture of Palms, more particularly the slender-growing species such as the above.

Geonoma gracilis makes a most elegant plant for table decoration, and will generally be found in the collections taking first prizes in competitions at flower-shows. It requires stove temperature, and unless carefully treated, the tips of the leaflets are liable to die off.

Areca crinita may be recommended as a table plant, but is not much grown at the present time.

Areca lutescens, though the Kentias have to some extent superseded it, is a desirable Palm, and makes a fine specimen. When well grown, it is certainly more elegant than the Kentias, but it will not stand exposure to the cold so well, otherwise there are few Palms more suitable for decoration, and it will always find admirers.

Areca Baueri is a fast-growing Palm, which makes a fine specimen, but it is only useful where large plants are required; for most purposes, I prefer it to Seaforthia elegans. The Seaforthia, however, has the advantage of making a good stem, and I should only recommend the Areca when grown tall.

Euterpe edulis is another Palm which makes a stem quickly, and as a tall plant with its drooping leaves it is very effective; but, unfortunately, it will not stand exposure to cold or rough usage, and consequently cannot be recommended for decorations except for the summer time, and when it does not get much knocking about.

Of hardier Palms, Corypha australis is one of the most useful; when grown in heat, the leaf-stalks run out more, and it makes a prettier plant, but it will grow well in a cool greenhouse, and even stand some slight degree of frost. Phœnix reclinata is a hardy serviceable Palm, useful when of medium size, and it is suitable for the conservatory or for the sub-tropical garden.

Latania borbonica, though not so well adapted for groups or associating with other plants, makes a grand specimen for isolated positions. For the sub-tropical garden large specimens are very effective, and if used in positions where they do not get the full force of the wind, they stand well, but when much exposed, the leaves get split and ragged. When grown in the stove and heavily shaded, this Palm makes long leaf-stalks, and has quite a different character to plants grown more exposed to the light and in a lower temperature. *O.*

NURSERY NOTES.

MESSRS. BARR AND SON'S NARCISSI.

The Narcissi will have a short life this year. Already the flowers are just fading, but the dull weather of the past few days will prolong the season. Brilliant sunshine for several weeks has prevented the flowers attaining full character; the stems are short, and there is an absence of that robustness and vigour conspicuous in more favourable years. But the visitor to the nursery of Messrs. Barr & Son at Long Ditton, near Surbiton, will find a splendid collection in full beauty, and for several weeks the Narcissi have been represented by one or other of the many forms, the Pallidus præcox type, being amongst the earliest to expand in bloom. It is impossible where the collection is so great to do more than refer to a few of the finer varieties, and the Poet's Narcissi now make a good display, the several forms of N. poeticus, as ornatus—the most useful of the group, grandiflorus and poetarum; they create sheets of the purest white. All the more popular Narcissi, for which there is a large demand, occupy long beds, raised a little above the level to throw off superfluous moisture. It is interesting, when going through this unique collection, to note the greater vigour of some kinds over others, the white Narcissi, N. cernuus and that section, requiring warmer and lighter spots than the robust "trumpets."

The Ajax section contains many beautiful varieties. Glory of Leyden is in fine bloom, the flowers fully, if not more than, 5 inches in breadth, and of immense vigour. This is, we should say, the largest of all Narcissi for breadth and massiveness, the segments light yellow, but the corona of a richer shade. It resembles Emperor, which with Empress and Horsfieldi, are of course amongst the more popular of this group. Golden Spur is a fine variety, early, strong in growth, the flowers deep yellow in colour—it is amongst the more useful of the family. Others were Henry Irving, Princeps, Mr. J. Berkeley, Santa Maria, James Walker, J. B. M. Camm—a very beautiful flower, white with quite a cream-coloured corona; T. A. Dorrien Smith, very distinct, the segments of the perianth sulphur colour, the trumpet rich yellow; and the large, finely-coloured Michael Foster. Captain Nelson is worth a note for its distinctness and beauty, the perianth creamy-white, and the cup bright yellow. A delightful little group is formed by N. Johnstoni, which is one of the most distinct of the Narcissi, and there are several good forms of the type, in some instances merely a matter, however, of degree. Mrs. George

Cammell and Queen of Spain are the two chief varieties, the flowers characterised by a neat charming shape and soft yellow colour; they are useful to cut, and have a refined appearance. One may spend much time amongst the Corbularias—exquisite flowers, that should be in all gardens. They are as pleasing in pots as in the open, and are not difficult to grow.

A beautiful section is N. incomparabilis, with a large flower, the segments broad, and of a bright yellow colour, throat widely expanded, and deeper tint. We noticed that those flowers with orange-scarlet margined crowns are in good character this year, but a little sun at the proper season would have brought out still more fully this distinguishing trait. Two very fine kinds are C. J. Backhouse and Gloria Mundi, the former a good garden Narcissus, the flowers of moderate size, yellow, and the crown brilliantly coloured with orange-scarlet; the latter kind, perhaps, the handsomer of the two. The perianth is of a fine yellow shade, the large crown richly stained with orange-scarlet. In the incomparabilis group, may be named also the popular Sir Watkin, hurrying past its best; Queen Sophia, the perianth sulphur-coloured, and the widely-expanded frilled crown orange scarlet. Queen Bess is worth noting for its colour, clear perianth white, the cup bright yellow.

The Barri group is of much interest. Again, we get the orange-scarlet crown Conspicuus in particular, the short cup edged with bright orange-scarlet, very brilliant against the yellow perianth; it is a beautiful and useful flower. Sensation is another beauty, the perianth very pure white, richly set off by the bright orange-scarlet edge to the crown; and a note may be made of Flora Wilson, another bright and attractive flower. All the various groups may be seen in perfection at Long Ditton, and those who care much for Narcissi will spend a day profitably amongst Mr. Barr's treasures laid out before the visitor. A host of beautiful things occur in the Leedsi section; for instance, Madge Matthew, a large white-flowered form, and Katherine Spurrell, a flower of much purity. A delicately beautiful kind is Duchess of Westminster, the perianth white, but the cup canary colour, and it emits a sweet scent, one of the most conspicuous of all Narcissi in this respect. Gem is well named, the white flower of excellent form.

Outside the larger groups, the doubles, Narcissus Burbidgei section, N. Backhousei, &c., occur many interesting Narcissi. A distinct departure is seen in Hume's concolor and Hume's Giant, excellent in pots, and good border kinds also. A beautiful form is N. Nelsoni, and the little N. Macleai is interesting for its distinctness and neat flowers, small white perianth, and yellow cup. It is interesting to see how some forms vary, N. Benardi and N. variiformis especially. All families of plants vary more or less in colour, but in Narcissi this variability is conspicuous. N. pallidus præcox, grown in quantity, yields many departures both in size, shape, and colour of the flowers. Each year the lover of Narcissi may learn something new. Collections of Narcissi at Long Ditton, and recently-collected bulbs, may be seen usually kept distinct, and presenting interesting characters; some of considerable value, promising to take a good place amongst popular kinds. Everyone who knows much about the Narcissus is acquainted with Mr. Peter Barr's good work amongst them, his introduction of new forms from Spain and Portugal, and bringing together every form known. But let it be remembered that the commoner kinds, the favourite old doubles, the Jonquils, and others are grown so largely that the nursery is gay with their varied colour, from white through shades of yellow to deepest orange. It is at this season the Long Ditton nursery is gayest, but soon will follow the Pæonies, late-flowering Tulips, and a host of early summer gems. Next year possibly a new and large rockery will be a feature. It is in course of construction, and then we shall get effects from the Narcissi that are impossible when these are grown on the level in long formal beds.

THE PRODUCTION AND TRADE OF VANILLA.

At a period when there is always an increased interest in the sale of "good" things, whether for food or for any other use, and at a time when a deal of attention has been given to the synthetical production of vanilline, the flavouring principle of Vanilla, it may be of special interest to know that enormous quantities of Vanilla-pods are still produced and shipped from the regular Vanilla-growing countries. Our contemporary, the *Chemist and Druggist*, quoting from a French source, says the Seychelles crop was at first estimated at 8000 kilogrammes, but it has since been put down at 4000 kilos. only. The Bourbon crop is stated to be 65,000 kilos. The old stock of Vanilla Beans in Bordeaux is said to be 14,000 kilos., while there were 8000 in Paris, 2000 in Hamburg, but in London there is no old stock. The crops of 1891—92 from Bourbon, Mauritius, and Seychelles amounted to a total of 148,000 kilos., while for 1892—93 they are estimated at 76,000 kilos. An interesting experiment in the preservation of Vanilla-pods, for export, which has before been referred to, is said to have been now adopted in Réunion, and consists of steeping the green fruit when freshly gathered in alcohol. This process was discovered in 1888 by three gentlemen of St. Denis, the capital of Réunion. Their names were Potier, the Director of the Botanical Garden; Chatel, a pharmacist; and Dandé, a planter. Museum specimens of green pods in alcohol were sent to the Paris Exhibition of 1889, but until now the process has not been carried out on a commercial scale. It is stated, however, that it is the intention of some of the Réunion growers to ship a considerable portion of this year's crop packed in casks in alcohol. The *rationale* of the alcohol process is based upon the view, that in the green Vanilla pods the vanilline or odorous principle does not exist in the free state, but in the form of a glucoside insoluble in alcohol; and that therefore the pods when landed in Europe will be richer in vanilline by about 40 per cent. than they would be had they been dried in the tropics.

The Week's Work.

THE FLOWER GARDEN.

By T. H. Crasp, *Gardener, Canford Manor, Wimborne.*

VASES, WINDOW BOXES.—Such as are at present unoccupied, or of which there are duplicates, should be prepared for their summer occupants by filling them with light, rich soil, and if it can be done, planting them at this season instead of waiting till next month. When planted and watered, place them in a cool-house, or if that is not attainable, a sheltered position out-of-doors, protecting them with mats on cold nights. Treated in this manner the plants become established by the time the bedding-out season arrives, and they look and are much better than if left till then; besides which, time and labour being saved, this lessens the pressure of work at a busy season.

ROSES at present are looking very promising, but the weather has been in favour of aphis and maggot, and the plants will need close attention to eradicate these pests, otherwise they will spoil the blooms which will soon be forming. There are a great many remedies for greenfly, but the handiest and quickest before they spread too far, is tobacco-powder. In bad cases, it is advisable to resort to the syringe, using some sort of insecticide. The surest and most harmless way to get rid of the maggot is to go over the plant and give each leaf that is infested a squeeze with the finger and thumb, which does the foliage much less harm than unfolding the leaf or picking it off. The dry weather has been very trying to Roses that were planted late, and should it continue, they should be watered overhead occasionally, so as to keep the wood as plump as possible. Briars intended for budding will now be breaking into growth; rub off all except three of the healthiest-looking eyes that may be nearest the heights you require; such treatment throws all the strength into the shoots that are to remain, as well as making it much easier to get among the plants during the budding season. Those budded last year should now receive attention; whether they commenced to grow in the autumn or early spring, it is necessary to see that the tips are properly removed from the Briar, as well as all suckers, which are apt to grow up from the old stock. Cut off the tops of dwarf budded Roses, and seize the first favourable opportunity of drawing some fine soil round the bud, in a way similar to moulding-up Potatos.

DAHLIAS.—These plants should be shifted into cold frames to harden off after they are rooted, but do not starve them in small pots, nor expose to currents of cold air. Any tubers that have not been started under glass may now be planted in the open borders where they are required to flower. See that the tubers are fully 3 inches below the surface of the soil. The ground cannot be too well manured and pulverised for their reception. All such plants as Brompton Stocks, Pentstemons, Antirrhinums, Violas, and Pansies, that have been wintered in frames or otherwise should now be planted, pressing the soil firmly round them, afterwards giving a good soaking of water occasionally.

SHRUBS, ETC.—With the continued dry weather all newly-planted trees and shrubs should receive a thorough good watering, and the syringe may be used after dry hot days over the foliage; and where a mulching of manure can be given this will save labour, and be productive of good.

FRUITS UNDER GLASS.

By M. Temple, *Gardener, Carron House, Stirlingshire.*

VINES.—At this season the weather is often changeable and cold, and heavy rains fall, which saturate the soil of the outside borders, rendering any uncovering not safe, the Vines often suffering a severe check, which is frequently the forerunner of shanking of the berries, and of mildew. There is always the temptation to allow the revivifying sun's rays to have full power on the soil, but there being no permanency in the genial sun-heat at this early part of the season, it is well to have portable coverings ready for use on a change to dull, cool weather, especially as regards early Vines, whose roots are near the surface, and consequently liable to be injured. It is even better to keep up the necessary warmth in the soil by adding some warm manure and leaves, than to risk chilling the roots. If on examination it is seen that the soil is dry—and such is likely to be the case on elevated and well-drained borders—a good watering with tepid water should be afforded, and liquid manure in a warm state is of advantage to Vines whose fruit is swelling. Inside borders should also be examined at frequent intervals, and watered as may be necessary. Grapes which are coloured should have fire-heat by day, accompanied with a free circulation of air for some time to thoroughly ripen them and give them flavour. Much of the inferior flavour of early and late Grapes is due to withholding fire-heat when they are still unripe; colour and bloom on black Grapes, often the misleading points, are at their best long before the fruit is really matured. It should be borne in mind that doses of strong liquid-manure applied when the colouring of the fruit is in progress also spoils flavour. As soon as the Grapes in the later houses are set and have begun to swell, the Vines should have a good application of liquid manure, or a dressing of some special Vine manure, which should be lightly forked in, and then liberally watered. There is a certain difficulty with roots which have extended beyond the limits of a made border, the soil of which may be getting inert. Such roots receive no benefit from watering the border, and this state of things affords an argument in favour of the roots of early Vines being kept entirely inside the vinery or cut off from the land beyond by means of a wall. Stop and tie down shoots gradually as they increase in length; thin the bunches as soon as the best berries can be discerned, and keep an even temperature. These are items in the management of Vines which cannot be neglected with impunity; unremitting attention in all stages of development is imperative.

THE ORCHARD-HOUSE.—This useful and profitable structure, which has done so much for the protection of plants and vegetables during the winter season, when the fruit trees were at rest, will now show signs of rewarding the cultivator. Much

of the prejudice against orchard-houses arose from ignorance of the proper methods of management and injudicious watering of the trees, especially in the application of moisture to the roots and foliage, which is an operation that should not be entrusted to inexperienced hands. Dribbles of water whilst roots are suffering from drought, applying liquid manure in a crude form, or using artificial preparations in too strong a state, and freely syringing the trees during damp and cloudy weather, are some of the points of bad practice, which make failures very probable. Sudden exposure of the trees to cold easterly winds when the fruit is setting, or in its earlier stages, is fatal to success. The thinning of the fruit, to allow those which are the best placed and largest to have the advantage, and the removal of shoots which are not required, which should be done by degrees, may now have attention. Those shoots which may be growing gross should be stopped. If black or green aphis are becoming troublesome, fumigate the house on two evenings in succession, syringing vigorously the morning afterwards. Trees which are planted in borders will not require so much watering at this season as pot plants, but every particle of soil over the drainage should be soaked when water has to be given; as heat increases, moisture and air should increase proportionately.

THE ORCHID HOUSES.

By W. Holmes, *Gardener, Pickering Lodge, Timperley.*

CATTLEYA-HOUSE.—Cattleya Lawrenceana and C. Schroderæ are two grand Cattleyas to fill up the period between the blooming of C. Trianæ, C. Mossiæ, and C. Mendelii, and the plants should now receive plenty of water. C. Schroderæ will often make four flowers on a spike, and sometimes five, whilst Cattleya Lawrenceana when well grown makes as many as six or seven flowers on a spike, and is a good species to grow. Whilst in flower the plants should be arranged at one end of the house, and a slightly dryer atmosphere kept. C. Schroderæ is one that will last in flower in good condition for a period of six weeks if properly treated.

ODONTOGLOSSUMS.—O. coronarium and its more profuse flowering variety, O. miniatum, are completing their growth, and if they are kept rather dryer at the root it will induce them to throw up their flower-spikes in a finer degree than if they are kept too moist. O. coronarium is a rather shy flowerer, but when well grown and afforded proper rest it may be induced to flower more freely than is usual. It should be placed close to the roof, and grown in teak-wood baskets or cradles with very little compost about it, but this should consist of sphagnum moss rather than anything else. A wooden cradle is very suitable for this plant, the rhizomes soon running over the sides of the ordinary baskets. The remarkable weather which has prevailed for the past six weeks has been favourable for Orchids, and has tended to reduce the fuel bill, fires having been much reduced by day, and much less being needed at night to keep the various houses at their proper temperature. Damping and syringing have been the chief points to attend to, plenty of ventilation both bottom and top being afforded.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

MULCHING WALL-FRUIT TREES.—This is a matter now requiring attention, and although the same has been repeatedly recommended, it is, nevertheless a neglected operation in many gardens; and in others, when the trees begin to show signs of lack of moisture in the soil, it is considered time enough to take the matter in hand. It is necessary to ascertain which are the trees to be mulched, the kind of mulching to use, and when it should be put on. In our uncertain and treacherous spring weather, most trees growing on Plum stocks and in somewhat dry borders would take water much earlier than it is usually afforded; still, it is unsafe to commence the watering of fruit trees before the fruit is well set, and the weather genial enough to warrant much encouragement of growth. Much growth made by trees at an early date renders injury from late frosts the more likely to occur, and in the case named, the mulching would prevent the escape of moisture until suitable weather offered for affording water at the root. This time is usually not earlier than the month of May. The materials of which hot-beds are usually made—that is, equal parts of stable manure and tree leaves—and which are no longer needed, afford, in my opinion, the best kind of mulching, and which I always make use of in this garden; for, whilst answering the purposes for which mulching is useful, viz., the loss of moisture from evaporation, and maintenance of an equable temperature in the soil, it allows sun-heat to penetrate it, which a thick coating of rotted farm-yard manure does not. Apricots, according to the size of the crop of fruit, should first receive attention; then the sweet Cherries, Plums, Peaches and Nectarines, and lastly Pears.

THE APRICOT.—The fruits of the Apricot are usually formed in clusters, and their thinning should be done early, so that those left to furnish the crop may attain as large size as possible before the stone forms. All strong foreright growths should be pinched back to three or four leaves—a practice that must be followed for some time longer. The stopping of these shoots will keep gross growth in check, which usually is found where the roots are in unrestricted borders.

THE GOOSEBERRY CATERPILLAR.—If this pest was troublesome last year, and no steps were taken at the proper time to destroy the larvæ, by removing and charring the surface-soil under the bushes, dressing with quicklime, or placing a good handful or two of fresh soot round the stems of the trees, and replacing that taken away with fresh soil, a sharp outlook should be kept for the first appearance of the caterpillars, and the bushes dusted whilst wet with dew or rain with Hellebore powder; the only remedy which can be applied at this season where the fruit is required for use in a green state.

THE KITCHEN GARDEN.

By H. C. Prinsep, *Gardener, Buxted Park, Uckfield.*

SALADS.—The cultivation of the materials for salads has become a more generally important matter than it once was, and a constant supply of the best things is not kept up without a good deal of forethought. The blanched leaves of the Dandelion are much enjoyed by some persons in the winter and spring and the plant is now included amongst those the gardener must grow. The large-leaved variety is the best, and to have these of good size, strong roots are wanted, quickly grown on good land, and which should not produce flowers before the plants are forced in darkness. For this reason the seed must not be sown too early, or the plants will often flower in the autumn, and if these are not picked off, the seed will be blown all over the place, and cause much labour in eradicating the self-sown plants. A sowing may now be made if an early supply is needed, but the main sowing need not be made before the middle of the month of May. The seed should be sown thinly in drills, from 12 to 15 inches apart, according to the quality of the soil; and when large enough to handle, the plants should be thinned out to 1 foot apart in the row. Snails devour the young leaves, as also the larvæ of the tiger moth, but as the eggs are laid in autumn the caterpillars are usually carried away with the dead leaves in winter, so that they do not often cause much damage, unless the plants are left undisturbed. A small sowing of Endive may also be made. This should be sown where it is intended to be grown, for if transplanted in dry weather, Endives are very liable to run to seed. Let the ground be in good tilth, for the quicker such plants grow, the less danger there is of their bolting. Sorrel is another plant whose leaves are used in salads, and the seed should be sown at the same time.

SEAKALE.—The shoots of sets which were early planted will have appeared some distance above-ground. When these are about 2 inches long, the weaker should be removed, leaving the strongest growth on each set, and taking care that it is uninjured. This shoot will form the crown for forcing next winter. After thinning the shoots, let the hoe be run between the rows.

ASPARAGUS.—The long-continued dry weather has made watering requisite in some districts. When watering is needed, it should be done in the early part of the day, so that the surface may be dried a little before nightfall, or the young tender growth of the Asparagus may suffer if frost should occur. I may here mention that at this place the thermometer fell to 19° F. on one occasion last week. New beds should have slight sprinklings to keep the soil from drying rapidly, but not enough should be afforded to lower the temperature of the soil, or the plants will not start readily into growth.

CARROTS.—The main crop of these roots may now be sown, treating the ground as previously recommended. Those on warm borders will be fit for thinning. This work should be carefully done, and a space of 3 inches left between the plants. When the thinning-out is finished, a dressing of some kind of artificial fertiliser should be afforded, or an application of liquid manure. If the weather remain dry, it will be necessary to water the beds rather frequently.

TURNIPS must have liberal treatment, or early-sown bulbs will run to seed, and it is only by keeping the plants growing quickly that fair-sized roots can be grown, and if they are long on the ground they become hot in flavour, and stringy. Make another sowing, and thin soon to prevent injury by the roots becoming crowded together.

CELERY.—Where a very early supply is needed, the first batch of plants may be transferred to the trenches as soon as there is a change to moist weather, and if the plants are getting crowded, and cannot be put into the trenches, they should be transplanted, and shelter afforded them on cold nights.

PLANTS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

AMARYLLIS (HIPPEASTRUM).—As the plants finish flowering, they should be placed in a warm house to encourage and continue their growth, potting such as may require a shift into somewhat larger pots, employing loam, a liberal addition of leaf-mould, manure, and coarse sand. The bulbs should be kept growing till they are matured, and then stored away till required again for starting. The pots may be placed on their sides under staging or on spare shelves in a house with a north aspect.

GLOXINIAS.—Prick out seedlings into thumb-pots as soon as they can be handled, filled with fine leaf-mould and peat, with a small quantity of silver sand. Old plants that are growing may be potted. Gloxinias do best in a moist hothouse or pit, and to be shaded from bright sunshine, and not syringed overhead. A table or shelf covered with sand is a good place for them. If the house has a hot-water tank it is a very suitable place for them, the moisture given off condensing on the foliage like dew.

STREPTOCARPUS, COLEUS, and other tender seedlings should be pricked out into small pots before they spoil, and kept in heat, and shaded till they are well rooted, when they can be removed into a cool house.

IMPATIENS HAWKERI, I. SULTANI, I. ALBA, and others of this useful class should now be increased by seeds in gentle bottom-heat, or by cuttings of young growths which will strike very quickly. They are easy to cultivate, and they grow well in a mixture of loam, leaf-mould, a small quantity of decomposed manure, and some sharp sand; the intermediate-house suits them best.

THE SCARBOROUGH LILY VALLOTA PURPUREA—Give this beautiful Cape bulb a good position, where it will obtain plenty of light and air—it is most useful in the autumn months. Pot on any plants that were not potted in the autumn. Give them good loam, peat, some dry cow-dung, and plenty of sea-sand. Drain the pots well, and give a good supply of liquid-manure to plants that are growing freely. The stock is easily increased by division of the bulbs.

BRUGMANSIA ARBOREA, B. KNIGHTII, and other varieties of these strong-growing, summer-flowering plants, if planted out, will be benefited by a top-dressing of good loam, and some rich manure. Plants in pots should be repotted at once, if they want it; give them turfy loam, peat, manure, and plenty of sand, and good supplies of water when growing. Standard plants in pots are very useful in summer-time. They may be dried off, and stored in cool shed for the winter if the frost is kept from them.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

SATURDAY, April 22—Royal National Tulip Society at Manchester.

TUESDAY, April 25—Royal Horticultural Society's Committees, at Drill Hall, James Street, Westminster.

SHOWS.

SUNDAY, April 23—Ghent Show (last day).

TUESDAY, April 25—Manchester Royal Botanic Society, and National Auricula Society Exhibition (northern section) in the Town Hall.

WEDNESDAY, April 26—Royal Botanic Society's Second Spring Show, at Regent's Park. Birmingham Narcissus Exhibition, Edgbaston Botanic Gardens (two days). York Florists' Spring Show (two days).

SALES.

WEDNESDAY, April 26—Tuberoses, Tea Roses, Greenhouse Plants, &c, at Protheroe & Morris' Rooms.

FRIDAY, April 28—Orchids from Messrs. F. Sander & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—49°.8.

The Ghent Quinquennial.

One more "quinquennial," larger than any and as brilliant as any, if not more so. But whilst these gatherings serve to illustrate forcibly the progress of horticulture, they are necessarily tinged with a feeling of sadness at the inevitable gaps in our ranks in the intervals. Where are Regel, Morren, De Cannart, Reichenbach, not to speak of our countrymen, whom we have lost in the interval? It seems as if we must surely meet with them in the Exhibition; at the social gatherings we hear their very voices—or, it seems to us as if we did so. Such reflections are inevitable; but while the workers one after another disappear from the scene, the work goes on happily, and, as we have said, the Ghent Quinquennial of 1893 is larger, and, in some respects, better than ever before. Certainly, as far as the attendance of notabilities goes, the meeting is very remarkable. From most of the countries of Europe, from Java and Japan, come notabilities in botany and horticulture; all the great societies of the Continent, and many of the smaller ones, are represented by their presidents, vice-presidents, and often by their secretaries also. Sir Trevor Lawrence very ably represents our own society, and has gained the universal recognition of the English contingent—a very large one—for the admirable manner in which he has acted as their spokesman and representative.

We fancy we have seen better groups of Palms at Ghent; it may be mere fancy, and certainly there is no bit of crystallized history such as we had five years ago, when the original exhibition of the Society with all its accessories was, as far as could be, repeated, in striking contrast to the exhibition of the day.

The arrangement on the present occasion, both in the main hall and in the annexe, is admirable (see pp. 453, 455, April 15). Heavy masses of foliage are relieved by bold outlying clumps of light Tree Ferns, &c., and these serve as the background to Anthuriums of startling brilliancy. Evidently much has been done in the way of Anthuriums during the last five years; never before have they played so extensive a part in the scheme of arrangement. A central group of Indian Azaleas is almost inevitable under the circumstances, but the flowers have a little passed their best, and the plants are veterans who have earned their *retraite*. Moreover, the training is formal and incongruous when compared with the graceful outlines all around. Many of these Rhododendrons and Azaleas have had, owing to the season, to be retarded by placing them in ice-chambers and dark sheds.

In the upper rooms are the Orchids, any number of them, as the phrase goes, some in groups, some singly, others arranged in charming little boudoirs, with all the adjuncts of drapery and curtains, mirrors and bronzes. We have heard something lately about Belgian superiority in the matter of the cultivation of Orchids, but excellent as are the plants shown, we do not think they are equal in quality to what may be seen at our own large shows, and certainly in matter of specimen plants we have nothing to fear. Here, too, are the bulbous plants, generally poor, owing to the season, the new plants which are of special interest, and odds and ends of all descriptions.

In addition to the main building is an annexe, the plan of which has been already given in our columns (April 15, p. 455). This is a wooden structure, imposing from its dimensions, and charmingly arranged by Mr. Pynaert. The whole place is flooded with soft light, filtered through light canvas, with occasional streaks of lightest green and rose. It has a peculiar airy appearance, which seems to give additional brilliancy and translucency to the masses of flowering plants. It is an admirable piece of work, and our congratulations to Mr. Pynaert, Mr. Burvenich, and Mr. Van Hulle will be universally confirmed. As we give a detailed report in another column, we need not extend our notice in this place.

The greatest interest centres, as we predicted would be the case, in the competition for the blue riband in the special class for "six plants with or without flower, of recent introduction, and not yet in commerce." Particular care was taken to secure a competent, an international, and an independent jury; and so it came about that, to judge twelve plants, seven judges were appointed! comprising three Belgians, MM. Closon (Jakob-Makoy), Kegeljan, Lubbers, Curator of the Brussels Botanic Gardens; one Frenchman, M. André; one German, Dr. Wendland; and two Englishmen, Mr. J. O'Brien and Dr. Masters. Some of these jurors were nominated by the rival exhibitors, and it is interesting to know that in more than one instance the same juror was chosen by both parties. Dr. Masters was called on to preside over this section, and M. André acted as secretary. Voting was by ballot, and, happily, when the voting papers were examined it was found that the jury were unanimous in their award of the first prize, a silver-gilt medal, to Messrs. F. Sander, of St. Albans. The plants shown by Messrs. Sander are Dracæna Sanderiana (see fig. 65, April 15), D. Godseffiana, a species in the way of D. surculosa, but with more slender stems, and with the dark green laurel-like leaves thickly spotted with bright yellow, like an Aucuba; Ludovia crenifolia (see fig. 64, April 15), which was described in our last issue, as also were Alocasia Watsoniana of which we shall give a figure next week; Strobilanthes Dyerianus, the pinkish-violet colour of whose leaves was much admired, and Alsophila atrovirens, a remarkable Fern, elsewhere described. All these plants were described in our last number with the exception of the Fern.

From the Compagnie Continentale of Brussels (Linden), comes a fine lot, but, with the exception of the noble Orchid Eulophiella Elizabethæ, the exhibit is evidently inferior to that sent from St. Albans. The Orchid just named is decidedly one of the most remarkable plants, if not the most remarkable plant, in the show. M. Linden accepted the result with manly acquiescence, looking forward to another occasion when matters may be reversed. It may be hoped that after this tourney, the rival combatants will smoke the pipe of peace, cancel the productions of their respective poets-laureate, and cease to agitate the horticultural world with polemics not consonant with the spirit which should animate all earnest workers in the cause we all of us have at heart. We are certain that we do but echo the feeling of the gardening community when we express the hope that these envenomed wranglings may now cease, and be unheard of evermore. Meantime, we must not forget to mention the five plants exhibited by the Compagnie Continentale, in addition to the Orchid above named. This is the more necessary as, so far as we can see, neither they nor the plants of Messrs. Sander are included in the catalogue. The competing lot from the Compagnie Continentale contained in addition to the Eulophiella, the following species and varieties, of which descriptive notes will be found at p. 474:—Tradescantia reginæ (fig. 71), Stenandrium Lindeni, Hæmanthus Lindeni (fig. 73), Smilax argyrea (see fig. 70, p. 475), and Tradescantia superba. Both exhibitors showed several other new plants, which are duly mentioned in our columns for this and for the preceding week.

In addition to Messrs. Sander, who bring the blue ribbon to England, there were a few English exhibitors. Messrs. Veitch show a fine lot of Amaryllis; Messrs. Heath, of Chippenham, show Orchids; Messrs. Pitcher & Manda exhibit Cypripediums; Messrs. Cutbush have a capital lot of small hard-wooded greenhouse plants, such as we are familiar with at home; Mr. Kellock sends some seedling Agaves, one of which, a very beautiful form, is dedicated to the King of the Belgians, and has been presented to His Majesty by the raiser.

One feature of the present exhibition is the carefully-arranged series of boiler-trials, to which we may allude on another occasion. We must also congratulate the editors of the *Revue de l'Horticulture Belge* on the promptitude with which they issued a report of the show in that journal. We know what this entails, and our congratulations have in consequence the more force.

The luncheon to the jury on the termination of their labours on Saturday last was a great success. It is rarely that English ears listen to such fluent oratory as fell from the lips of the President, the Minister of Agriculture (M. de Bruyn), and M. Léon Say, the eminent Free Trader, and also the President of the National Horticultural Society of France.

The dinner to the jury on the following day was also a great function, and here also the

speeches of the President, the Minister, MM. André, Vilmorin, and Professor Strassburger, of Bonn, were highly appreciated. Sir Trevor Lawrence, as we have indicated before, was the spokesman for the English, contrasting the history and position of the character were of necessity passed over, the authorities not caring to risk a possible demonstration of strikers before the Hotel de Ville. To our English eyes the "manifestations" seemed rather feeble on the surface, but what there may have been below, it is not by the concession of universal suffrage, tempered by plural voting in the case of men over a certain age, of married men, and of those whose education has been of a superior character.

In spite of their very grave political preoccupations and their police duties, our friends

Fig. 72. — SALMIA LAUCHEANA: HORT. SANDER.

(See *Gardeners' Chronicle*, April 15, 1893, p. 442.)

two societies, and expressing the cordial congratulations of our countrymen on the success of the exhibition, and their thanks for the hospitality and courtesy shown them. A "raout" was given on Monday evening, which enabled the visitors from all countries the opportunity of pleasant converse with their Belgian friends. Other festivities of a public for strangers to estimate. Meanwhile, it may serve to show how hard the organisers of the show had to work when we say that several of them had to do their heavy and harassing task at the exhibition all day, and to take their place in the municipal guard at night! Happily, comparatively little occurred to disturb the peace of the city, and the political troubles are ended left nothing undone that could be done to secure the pleasure and the profit of their very numerous guests.

It only remains for us again to express our hearty congratulations to our Ghent friends on the success of their exhibition, and to thank them very earnestly for this renewed illustration of their warm-hearted confraternity.

Royal Horticultural Society.—The next meeting of the Royal Horticultural Society will be held on Tuesday, April 25, at the Drill Hall, James Street, Victoria Street, Westminster, and it promises to be of exceptional interest. Besides Daffodils, Orchids, hardy plants, fruits, &c., the members of the National Auricula and Primula Society will bring their choicest plants, which will be sure to possess much attraction for the visitors. At 3 p.m. a lecture on "Alpine Plants" by Mons. Henri Correvon, of the Jardin d'Acclimatation, Geneva, will be given. The lecture on "Chemical Questions concerning the Soil," by Professor Cheshire, has been postponed until May 9.

Horticultural Club.—The usual monthly dinner and *conversazione* took place at the Hotel Windsor on Tuesday evening, 11th inst., the chair being occupied by Sir J. D. T. Llewelyn, Bart., the chairman of the Club. There was a good attendance of members, including the Rev. W. Wilks, Rev. T. Handley, Messrs. G. Bunyard, E. Cockett, G. Paul, Harrison Weir, H. Selfe Leonard, and Dr. Soper. The discussion was upon "Hunting for Alpine Plants," and was opened with a very interesting paper by Mr. H. Selfe Leonard, in which, after describing the necessary outfit for anyone engaged in this pursuit, he gave a graphic description of his wanderings in the Dolomite region of the Southern Tyrol and in the Engadine, which he regarded as two of the richest fields of the alpine flora in Europe, presenting, as they did, that of the granite and calcareous formation. He showed how, in the Dolomite region especially, where the two formations ran side by side, how completely distinct were the plants found on each. With regard to cultivation, he explained some of the difficulties attending it, owing not only to the various requirements of the plants, but also to the varying character of our winters—warm and sunny days being often succeeded by severe frosts and snow; while in the alpine districts the plants were covered with snow throughout the winter, which kept them warm and dry until the frost gave up in the spring. An interesting discussion took place, in which most of the members present joined. A cordial vote of thanks was awarded to Mr. Leonard, on the proposition of the chairman. The secretary announced that a special dinner would take place on the 25th inst., to do honour to M. Henri Correvon, of Geneva.

Royal Caledonian Horticultural Society's Show.—The spring flower show of the above was patronised by a larger number of the public than usually attends on the opening day, and the takings amounted to £250; afterwards, however, the attendance, though by no means small, was not quite so large as in former years.

National Chrysanthemum Society.—A meeting of the General Committee took place at Anderton's Hotel, Fleet Street, on the 12th inst. E. C. Jukes, Esq., vice-chairman of the committee, presided. After the reading of the minutes, and some discussion arising from a personal explanation by the Secretary, Mr. E. Rowbottom was elected a member of the Floral Committee, in the place of Mr. C. E. Shea, who has resigned. Mr. W. Herbert Fowler was unanimously elected chairman of the Floral Committee for 1893-4, in the place of Mr. C. E. Shea, resigned. Messrs. Henry Cannell and E. Molyneux were elected members of the General Committee, in the places of Mr. A. J. Veitch, resigned; and Mr. R. Payne, deceased. The Hon. Secretary announced that the reserve fund amounted to £39 15*s*, and that the schedule of prizes, delayed through the resignation of Mr. C. E Shea, as chairman of the Floral Committee, would be issued at once. Several new members were elected, and the Tonbridge Gardeners' Association admitted to affiliation. The proceedings closed with the usual vote of thanks to the chairman.

Experiments with Insecticides at Evesham.—On Saturday last, the 15th inst., the Stott Fertiliser and Insecticide Distributor Co. (Limited) were invited to give an exhibition of their varied appliances for the prevention and destruction of insect and other pests, by some members of the Evesham Fruit Growers Association. The time fixed was 10 a.m., in the orchards of Joseph Masters, Esq., ex-Mayor of Evesham. A numerous company of fruit-growers were present from Toddington, Evesham, and Pershore. All the appliances and insecticides of the Company were experimented with, and for the first time the new 30-gallon engine was brought out. This engine is fitted with a patent quadruple-acting forcing-pump. The patent distributors were fixed on the handles of the pump, and from each a distributor was fixed, and the new adjustable sprayer was used. The distributors were charged with "Killmright," and various bushes and trees sprayed with the solution given off. The result was everything that could be desired; caterpillar, aphis, and red-spider alike met their fate. The patent syringe was next charged, and used on black-fly, and although the strength was not more than ½ oz. to the gallon, this pest was quickly destroyed wholesale. This being an informal meeting of the fruit-growers of the district, the results were so satisfactory that it was decided to invite all the members to meet at 11.30 on Saturday next at Lord Sudeley's, Toddington. Mr. Stott expressed his thanks, and remarked he should only be too pleased to give a further demonstration. Mr. Wise remarked he should expect as many members to be present as could make it convenient.

East Anglian Horticultural Club.—A very successful concert was given in the Assembly Room of the Agricultural Hall, Norwich, by the *employés* of Messrs. Daniels Bros., seedsmen of that town, on the evening of the 13th inst. The club consists of a large number of East Anglian gardeners, and its main object, as the name would imply, is to promote the interests of horticulture. The committee are empowered to apply their surplus funds to charitable purposes, such as the assisting of gardeners overtaken by misfortune, and it was in aid of this benevolent object that the concert was given.

English and Tasmanian Apples.—Some fruits of the above, kindly sent for our inspection by Mr. Webber, Covent Garden Market, show how complete is now the overlapping of two Apple seasons, that of our own country and Tasmania. The fruit consisted of Ribston Pippins, and so far as appearance went, but little difference was observed. The English-grown was naturally a little wilted, whilst the colonial was still plump. Some of the latter had a green rind, resembling the fruit of Northern England and Scotland, whilst the other was high coloured, as we see it in Sussex, Worcester, or Kent.

The Surveyors' Institution.—At the ordinary general meeting, held on Monday, April 10, a paper was read by Mr. T. Bright, on "Underwoods: their Growth and Utilisation." A discussion followed, and was adjourned to the next meeting; and a vote of thanks was unanimously passed to Mr. Bright for his paper. The next ordinary general meeting will be held on Monday, April 24, when the adjourned discussion on the paper read by Mr. T. Bright at the last meeting, on "Underwoods: their Growth and Utilisation," will be resumed; and should time permit, a paper will be read by Mr. R. F. Grantham (Associate), entitled "Recent Experience in Sewage Filtration considered in Relation to River Pollution." The chair to be taken at 8 o'clock.

Presentation to Mr. and Mrs. E. S. Dodwell.—The committee formed to raise a fund in order to make a suitable presentation to Mr. and Mrs. E. S. Dodwell, on the occasion of celebrating their golden wedding on the 20th inst., decided in consideration of Mrs. Dodwell's state of health, not to make a formal presentation in person on their wedding day as originally intended; but a sterling silver tea and coffee service was forwarded to Oxford, with many hearty congratulations. Advantage will be taken of the gathering at Stanley Road, Oxford, on the occasion of the annual festival of the Carnation and Picotee Union, to make a formal presentation of a silver salver and any other piece of plate which may be decided upon.

Hyde Park.—The flower walk in Kensington Gardens is just now quite gay with flowering trees and shrubs. Worthy of special mention are Pyrus japonica, Prunus triloba, with delicate blush-coloured double flowers, thickly set on long slender branches; the common Lilac, its profusion of flowers rendering the bushes conspicuous objects; and the beautiful Magnolia Soulangeana, flowers large, white, veined, and shaded purple; the Double Cherry (Cerasus avium multiplex), one of the loveliest flowering trees, and quite hardy, is just coming finely into flower. There are also some splendid patches of Scilla sibirica under the trees in the walk, the shade afforded by these bringing out the colours magnificently. Colonies of Hyacinths and Tulips planted between the herbaceous plants afford a gay floral display. The Hyacinths, Tulips, and Narcissi in Park Lane are about at their best; a little rain would, however, much improve them.

Technical Education at Cambridge.—The Cambridge University Extension authorities have already announced as part of the programme of their summer meeting, to be held in Cambridge next autumn, five courses of practical work in science in the university laboratories and museums, the subjects selected being chemistry, electricity, botany, physiology, and geology. As however the date of the summer meeting, July 29 to August 26, is too early for many teachers in elementary schools, whose holidays fall during harvest-time, arrangements have also been made for two courses in agricultural chemistry, specially adapted to meet the requirements of teachers sent with scholarships by their respective County Councils. Each course will extend from August 25 to September 12 inclusive, and will thus include sixteen working days, on each of which several hours' work in the university laboratory will be provided. One course, conducted by Mr. Fenton, one of the university demonstrators, is intended for students who have done little or no laboratory work, but have acquired a knowledge of theoretical chemistry, and will be similar to the course given last year, and attended by about 120 County Council scholars. The other course, conducted by Mr. R. H. Adie, one of the Cambridge extension lecturers, will be more advanced in character, and will be adapted to students who went through last year's course with credit, or have done similar work elsewhere. Accommodation for 120 students can be provided at these two courses.

Newcastle and District Horticultural Mutual Improvement Society.—The monthly meeting of the members of the above Society was held on Wednesday, the 12th inst., in the Wood Memorial Hall, Mr. A. Heslop presiding. Mr. G. Walker, of The Cedars, Low Fell, read a thoroughly practical paper on "Tomatos," which was followed by a lengthy discussion. The benevolent scheme was allowed to stand over for further consideration until next meeting.

The Tunbridge Wells and District Gardeners' Mutual Improvement Association.—The Committee of the above, in presenting the fourth annual balance sheet and statement of accounts, for the year ending March 31, 1893, are able to congratulate the members on the satisfactory amount of work accomplished during the past year. The balance at the bank on the general account of £45 18*s*. 6*d*., being an increase of £11 15*s*. 7*d*. for the year.

A New Narcissus.—That industrious cultivator and raiser of Narcissi, the Rev. G. H. Engleheart, Appleshaw, Andover, kindly sends us his latest success, viz., a flower which is the result of crossing N. poeticus ornatus and N. p. poetarum. In his note accompanying the new flower, and those of its parents, Mr. Engleheart says:—"The great

increase of size is very remarkable; the cross-bred plant may, without exaggeration, be described as in all respects twice the size of either parent. From this same origin I have flowers even larger, and with conspicuous eyes of deep crimson. All the flowers sent have been grown under the same conditions in my garden, and are all far below normal size, owing to the extraordinary drought, which on this hot and dry soil is felt severely by the Narcissi. This new strain of N. poeticus is larger, more robust, and far more floriferous than the kind known as grandiflorus." [The flowers sent for inspection measured $3\frac{1}{10}$ inches in diameter, and possessed petals which are of greater breadth than those of N. ornatus, with the deep orange-coloured corona of N. p. poetarum, and the perfume of N. poeticus. Their rather poor substance, as compared with the blooms of either of its parents, seems to be its only failing. As a plant for good-sized groups and masses on the turf or in borders, it should be a most effective plant. Ed.]

Fig. 73.—Hæmanthus lindeni, hort. linden: flowers salmon-coloured. (see p. 474.)

Wood Green Horticultural Society.—A special meeting of the members of this Society took place in the Masonic Hall, on Tuesday evening, April 11, to hear an address on the Auricula from Mr. R. Dean, Ealing, there being a large attendance. A great deal of interest gathered about this meeting, many amateurs of the district having begun the cultivation of this fascinating flower, though the strains in their possession are simply the border varieties; and a number of specimens of locally grown flowers were staged. In response to a hearty vote of thanks, Mr. Dean urged his hearers to make a point of attending the annual exhibition of the National Auricula and Primula Society at the Drill Hall, Westminster, on the 25th inst., when they would be able to see Auriculas shown in their best form, and in a great variety of types.

The Frosts and the Fruit Bloom.—Whilst the weather will remain the chief topic of conversation with humanity for all time, just now its possible effects on the fruit bloom is in everyones' mouth. Those whose acquaintance with the subject is superficial, see in the brilliant sunshine and warmth of the days, allied to the remarkable abundance of bloom on all kinds of fruit trees, only that which is rich in promise. Those who are better acquainted with facts see in the long-continued low temperature at night, and sharp, if dry frosts, much to create alarm. Some over-wise people have suggested that the cold nights do serve the good service of keeping bloom in check, and yet are oblivious of the fact that it is on the average in greatest luxuriance fully a week or two too early. Still further do they fail to see how severe is the ordeal through which bloom has to pass where the temperature ranges from 60° to 70° in the day, down to 20° at night, for 12° of frost seems to have been frequently recorded. The hope of the fruit-growers just now lies in the fact—first, that there is such a wealth of bloom, that if but one-third of it is saved, there will be a heavy crop of fruit; and secondly, that the weather has been so abnormally dry, that there has been little of moisture settling on the flowers. Undoubtedly, a change to a softer atmosphere and frequent showers would be hailed with the utmost satisfaction. In a hundred directions rain is needed, and its value in warding off frost and fertilising the fruit bloom is not one of the least. We can largely now, thanks to better knowledge, do much to protect fruit trees from insect pests; but from such frosts as we have recently experienced, there seems to be no protection.

Quinine in America.—Judging from a recent report of the quinine market, it seems that the consumption of this all-important medicine, though still realising low prices, is on the increase. Brunswick manufactured quinine was fetching last month only a trifle over 8*d.* per oz. It was stated by a New York house that the imports of quinine (as sulphate and in the bark) into the United States in 1892 amounted at least to 4,500,000 oz., or half the estimated output of all the factories in the world. As it is said to be a well-known fact that stocks in the States are lighter than usual, it is argued that the consumption of quinine in America must be on the increase; also that generally all over the world the consumption is ahead of the production, and that the deficiency is supplied by the surplus stocks of former years. If this is true, it is good news for Cinchona planters.

Perfume-yielding Flowers at Grasse.—It is reported that the Violet crops in the south of France this spring, have given only a mediocre result, the output being not quite sufficient to satisfy the requirements of the local manufacturers. It seems that during the present, and in many previous years, the Violet plants have suffered from a blight, which has injured the flowering. The French and Algerian Geranium growers continue to complain of the competition to which they are being subjected by the distillers in Réunion, whose output is increasing very rapidly. Almost every steamer that arrives at Marseilles brings Réunion Geranium oil, sometimes by thirty cases or more in one consignment. The Orange trees at Grasse promise a good crop of flowers. Jonquils are now being gathered, but the prices realised for these flowers are so low, that they are gradually going out of use for perfumery purposes.

Planting of Newcastle Town Moor.—The Mayor, in the course of some sensible remarks which he made at the Easter Guild of Freemen recently, and especially in his remarks to this effect, that "if the tree planting had been carried out many years ago, by this time there would have been a drive and an avenue of trees second to none in the Kingdom. Not the least interesting feature in connection with the tree planting, is the fact that it has given work to scores of men who otherwise would have gone without any work for some time, and whose wives and children would probably have been without food."

Zamias: their Poisonous Qualities.—A recent number of the *Queenslander* says, that a letter which Dr. T. L. Bancroft has received from Mr. Wm. Broome would appear to remove all doubt as to the disease known as "rickets" in cattle being caused by the animals eating the Zamia. The disease is prevalent in Western Australia, and in 1890 a Royal Commission was appointed in that colony to inquire into the cause of it. The bulk of the evidence attributes the disease to the cattle eating the nut of the Zamia. It appears beyond dispute that the disease, both in Western Australia and in Queensland, is confined to country in which the Zamia grows, and it was given in evidence that the nuts of the Zamia were found in several instances in the stomachs of affected animals. If it be

accepted that the disease is caused by the Zamia, the only remedy will be for those occupying country on which the Zamia grows to cut down and carefully burn every plant. In the destruction of the Zamia, it will be necessary to consume the whole of the plant by fire, as all the evidence seems to point to the fact that when scorched or half-consumed by fire the plant is more relished by cattle than when in a green state.

New and Curious Substances from Plants.—Amongst a number of obscure but chemically-interesting substances which have recently been obtained from plants, we notice the following:—From the root of Corydalis cava, M. Freund has isolated several alkaloids, namely, corydaline, bulbocapnine, and corycavine. G. Carrara has obtained condurangin from the bark of Gonolobus condurango; this subsance is supposed to be identical with the zincetoxin from Asclepias vincetoxicum. Schimmel, the great German essence manufacturer, has found cineole in the oil of Lavandula spica. Gérard has shown that the choluterol derived from phanerogamous plants is identical in physical and chemical properties with the phytosterin of Hesse; whilst that obtained from cryptogams is similar to the ergosterin of Tausit. From the Belladonna, E. Merck has obtained another alkaloid, namely, apoatropine. Altogether, this plant well deserves its other name of "Deadly Nightshade." Schmidt has found scopolamine in Hyoscyamus niger, Atropa belladonna, Datura stramonium, and Duboisia myoporoïdes. C. Senger finds that Artemisia absinthum contains large quantities of absinthin. From Licari kanali P. Barbier has isolated licarol.

Aristolochia.—Not only is the flower of these plants very singular to outward appearance, but the internal construction is equally interesting. The stamens form a column, and at the back of each stamen, and, as it were, prolonged from it, is a peculiar appendage, the exact nature of which has been a matter of dispute. The position of the appendages superposed to the stamens, forms an obstacle to considering them as styles; others, therefore, think them mere excrescences from the stamens, but if so, then where are the styles? Mdlle. A. Mayoux, of the Faculty of Sciences of Lyons, has investigated the subject afresh, and, after considering the views put forward by various botanists, proceeds to give the results of her own investigations into the presence and distribution of the vascular system of the flower, in the hope that in connection with the results obtained by other methods, a satisfactory conclusion may be arrived at. She concludes that in most of the species of this genus the staminal column consists of six stamens, alternating with six stigmas. One half of each stigma is concrescent with the adjoining stamen, and the concrescence extending beyond the anthers, the result is the formation of the six appendages "superposed" to the stamen, each appendage being composed of the coherent halves of two stigmas, an arrangement similar to that which occurs in the stigma of Papaver.

Cytisus Andreanus.—In a communication to the *Garden*, M. André says that this plant is grafted on the Laburnum, and in this way may be grown on calcareous soil, where the Broom would not thrive.

Boston.—During his recent visit to Japan, Prof. Sargent sent home to the Arnold Arboretum a great many seeds, numbering several hundred species and varieties of trees and shrubs. These include Pines, Birches, Oaks, Chestnuts, Magnolias, Rhododendrons, Andromedas, Actinidias, Hydrangeas, Hypericums, Rosa multiflora in several forms, &c., all more or less rare and novel here, and some not yet classified anywhere. The hardiness of many of these remains to be proved, but it is confidently expected that out of the collection many valuable additions to our list of hardy ornamental shrubs will be secured. The seeds are all sown in boxes and pots, and some will probably take a year or two to germinate, but there are already 121 varieties up, inside of three months of the sowing. Mr. Dawson sows all of the finest seeds, such as Rhododendrons, Andromedas, and Hydrangeas, on sphagnum instead of soil. In some cases he has sown the same varieties in both ways, the result being in every instance greatly in favour of the moss. Flower-pots are half filled with drainage, over this is put an inch of soil, and then the sphagnum is placed on top, and the seeds sown on it. The advantages are many. A light sprinkling will keep the moss sufficiently moist without being too wet, and in dark damp weather there is no danger of sour soil or damping off. In the case of seeds of slow germination, the surface of the soil is apt to get badly caked over with a growth of algæ. This is entirely avoided by using the moss. Transplanting is done with a pair of small wooden pincers, by means of which the tiniest seedlings are pulled out of the moss without injury to the roots, or disturbance of other seeds not yet sprouted, to be then dibbled into flats. Already 10,000 young Rhododendrons have been so transplanted. Among these are some new R. indicums, which may possibly prove hardy here. *The American Florist.*

Home Correspondence.

Rhododendron nobleanum.—On p. 363, this this fine-coloured Rhododendron is mentioned by Mr. Weller, who wonders why it it is not more extensively grown. One reason I can give is, that the flowers open so early in the spring, when in many parts of the country, sharp frosts prevents its usefulness. Possibly some near the sea-coast avoid these frosts. We have here one bush of this species in a large bed, surrounded by other and later sorts, but almost every spring we have the flowers killed by frost—it seems so tender. At the end of January this year, I noticed four trusses that opened well, but they were in the middle of the bush and partly underneath, so were well protected. By the middle of March the whole of the plant was in bloom at its best, but on two successive nights we had 9° of frost, and the whole of the trusses were killed. Some springs they escape, and are then most useful for cutting purposes, as the Rhododendron, I consider, is one of the finest and best of plants for cut flowers. If cut fresh in the early morning, it travels well, and lasts well. *A. Harding, North Hunts.*

Spinach.—For the last ten or twelve years I have been accustomed to reverse the order of things by sowing the Prickly seeded Spinach for summer and the Round seeded for winter use. On our light hot soils the Prickly does not run to flower so quickly as the round-seeded varieties, and the latter varieties appear to stand the winter better than the Prickly. This last winter I have had large breadths of the Victoria, Monstrous, Viroflay, and Prickly growing side by side. The Prickly was sown in order to compare its merits with the others. The two former, both being round seeded, were the best, Victoria yielding the better of the two. I can strongly recommend Victoria as being the best for winter use. Perfectly hardy, it seems to recover much more quickly from the effects of severe frost than the other varieties. *South Devon.*

—— "A. D." refers to this useful vegetable, and wishes to know other gardeners' experience respecting sowing Round *versus* prickly-seeded for winter use. I have been a head gardener for more than twenty years, and have grown Spinach largely, and for more than half that time I have sown none other than the round-seeded kind. I have always considered it to be equally as hardy as the other, and I give it the preference because I consider that it fills the vegetable-basket more quickly. Spinach should be sown in shallow drills at 15 or 18 inches apart, and when large enough to handle, be thinned or singled out to 1 foot apart, kept clean and frequently hoed between, and then good fat leaves are the result. To those fond of Spinach in autumn and spring, two sowings are essential, one of them to be made the first week in August. This sowing will furnish supplies from the end of September to Christmas, or till bad weather occurs. The other sowing should be made the last week in the same month, which will not be fit for picking till after the winter is over, but it will carry on supplies till the spring-sown comes in. This last (August) sowing I have invariably found to withstand a hard winter well, when perhaps 90 per cent. of the earlier ones were killed, or nearly so. *A. Harding.*

Caterpillars.—In one of the London wholesale seed catalogues appears among the flower seeds the name of Caterpillars; and it has occupied a place in wholesale seed catalogues for many years past, though it is gradually disappearing from among their contents. Dr. Lindley and M. Henri Vilmorin attribute Caterpillars to the genus Scorpiurus, but Dr. Hogg to Astralagus hamosus, the Hook-podded Milk Vetch, which he states is so called in reference to the shape of the pods. Though as above observed, Caterpillars finds a place in seed catologues among the flower seeds, M. Henri Vilmorin places it among the vegetables, and in the *Vegetable Kingdom* he enumerates and illustrates four species, all annuals. That which is generally sold as Caterpillars are the seed-pods—entire, not the shelled seeds—of the common Caterpillar, S. vermiculata, which when quite ripe and dry are seen in a curled form, and appear like a good-sized caterpillar. This is the largest podded of the four. Then there are the prickly Caterpillar, S. muricata; the striped S. sulcata, and the hairy S. subvillosa, all three smaller in the pod than the first-named. The seeds can be sown in the open ground like those of ordinary hardy annuals, and they bloom and bear pods in two or three months. Under the head of "Uses," M. H. Vilmorin informs us that the Caterpillars are seldom grown, except as curiosities, from the singular appearance of the pods, which resemble various kinds of caterpillars in a very striking manner. They are sometimes, as a harmless practical joke, put into salads for the purpose of startling those who are unacquainted with them; but, as a vegetable their flavour is very indifferent. *R. D.*

The Verbena.—There are few plants which are capable of presenting a more brilliant mass of colour in the summer flower-garden than Verbenas, where the soil is suitable. Some years ago the plant was much more generally cultivated than now, and probably the greatest drawback to their culture was the liability of the plants to attacks of mildew, and, in the case of young plants, to green-fly. I grow a variety which I had from Mr. Gilbert, gardener at Burghley House, Stamford, and so far I have never found the least sign of mildew on it during the summer months. The plant is robust, of dwarf stature, and it produces a fine lot of bloom. Verbena beds should always have, if the soil is poor, some small quantity of fresh soil, a liberal supply of well-rotted manure, and a sprinkling of soot, and they should be deeply dug. When planted in beds of large size, they soon cover the soil, if they are pegged neatly down. Verbena venosa is one of the most useful species for bedding, the blooms when in masses presenting a very good effect if dotted amongst plants with silvery foliage. These Verbenas are readily raised from seed, but the best way with them is to lift in the autumn a few of the root masses and box them up, and during the month of February place these in slight heat, when they soon throw up plenty of shoots that may be taken for cuttings. *H. Markham.*

Large Nepenthes Pitchers. — Well-grown Nepenthes are always attractive, especially when the pitchers are of a large size, and the gardener who succeeds in growing N. Rajah so as to obtain pitchers approximating the size of those it bears in its own native habitat, will accomplish no mean feat in horticulture, as up to the present all Nepenthes growers have failed with this species, which perhaps is the most wonderful of the genus. At present it is very scarce in cultivation. The following measurements were taken from a plant of N. Mastersiana, which was bearing eighteen finely-developed pitchers, in the collection of T. Wilson, Esq., of Sheffield. Length of pitcher 13½ inches, measuring from mouth of pitcher to base; circumference at widest part 11 inches. One of the pitchers Mr. Hannah, the gardener, informs me held nearly a quart of water. The height of plant growing in a basket is about 4½ feet. N. Curtisi var. superba is also in extra fine condition; length of pitcher from base to rim, 9¼ inches; length from base to top of lid, 11½ inches; circumference at thickest part, 11¾ inches. Other kinds are grown at this establishment, but these in particular are striking examples of high-class cultivation. *W. Harrow, Sheffield.*

The Gooseberry Caterpillar.—(See p. 392). The young caterpillars hibernate under the fallen leaves, and begin again to feed in the coming spring.

In July they change between some leaves into chrysalis, that gives the Abraxas after some weeks. *Dr. Emil Kalender, Cologne.*

EARLY SWARMING OF BEES.—It may be interesting to some of your readers to hear that we had a swarm of bees on Friday, April 7. This, I believe, is exceptionally early; at least, for this locality. If the old adage be true, that a swarm in May is worth a load of hay, what are these worth? *W. G., Worcestershire.*

THE EARLY SPRING.—It is very interesting to read the different notes with regard to the blossom of the fruit trees, and the expected safety of the same. But on the 13th we had 4° of frost, which damaged a great deal of blossom on the Apple and the Morello Cherry. The weather previous to the 13th was very hot, excepting the nights, and most things are very forward. Nearly all Broccoli are passed, including the Model and Gilbert's Late Queen. I picked Gooseberries on the 17th (Keepsake). We have only had one slight shower, ·09, during the last thirty-two days. Rain is wanted badly indeed. *North Devon.*

THE TEMPERATURE IN WARWICKSHIRE.—This morning, April 14, my thermometer, at 3 feet from the ground, stood at 23°, or 9° of frost, and I fear the fruit crops will suffer; Plums, Pears, and Cherries are white with bloom. *Thos. Woodford.*

FORCED STRAWBERRIES.—Not having tried the variety John Ruskin, I am unable to speak as to its merits as a forcer. I may mention, though, that I was somewhat doubtful of its merits when I saw it boomed so strongly in the general press a little over twelve months ago of fruit fetching £2 per lb. in the market, thinking that any growers who could net such a price for its fruit would have preferred keeping it in their own hands a little longer, unless they wanted to sell plants and not fruit. Auguste Nicaise, which I have tried for the first time this spring, has proved to be a really good, useful variety; my plants were not strong, but they have produced a good crop, many of the individual fruits being 1½ oz. each, and I hope to grow more of it another year. As one of the first to draw your readers' attention to the good qualities of La Grosse Sucrée seventeen years ago, I have pleasure in seeing that it is being still cultivated successfully by several of your correspondents. It has formed a third of the 1200 plants that I grow, for many years past. *Yorkshireman.*

STRAWBERRY JOHN RUSKIN.—I notice your correspondent, Mr. Rickett, finding a number of faults with the Strawberry under notice, and shall be curious to hear how it behaves at other places. I have forced it three seasons, and nothing could be better. We put in nearly 200 into a cool vinery on the 1st of last December, top-dressed them, and on the 1st of January, put them into heat of about 50°; they threw up their flower-stems particularly strong, and when the flowers expanded, the temperature was raised to 60°, and then to 65° at night. The flowers were brushed over with a rabbit's tail, and I think every bloom set perfectly, in fact, I never saw any kind set so well. On March 10, we gathered 2 lb., some of which weighed half an ounce. The fruit made 20*s.* in the open market. I gathered 14 lb. of good fruit from 189 plants. I enclose my salesman's letter for your inspection. Not a spot of mildew ever seen on them, if it had been, I should have killed them at once. *R. Gilbert, Burghley.* [The note, dated March 14, alluded to, is to the effect that the fruit of J. Ruskin sent by Mr. Gilbert, was of good size for an early Strawberry, larger than Viscountess, and that it appeared to travel well. Ed.]

—— John Ruskin Strawberry has done well with me this season. I put into the forcing-house one hundred plants the first week in January, and I gathered good fruit on March 23, several weighing 1 oz. a-piece, and from these plants I have gathered 13 lb. of excellent fruit, good in colour and flavour, and the plant quite free from mildew. It may be considered a very good Strawberry for early forcing, and it is one that I intend to grow another year. *James Hope, Weston Park, Shifnal, April* 17.

CAMELLIA RETICULATA.—While on a recent visit to Chatsworth Gardens, my attention was particularly riveted upon two fine plants of the above, ladened with buds, trained to the wall in the corridor, planted out, of course, and by the time this note appears in the pages of the *Gardeners' Chronicle*, these plants will present a picture of great beauty. Mr. Chester has favoured me with the dimensions of these, and the figures given cause those in works on horticulture to look somewhat diminutive. The height of the plants are 22½ feet; width, 24 feet, the other 22 feet; circumference of stems at 1 foot from the ground 20 inches. It is only when these are planted out that one sees the flowers develop into large size, pot or tub cultivation diminishes the size of the petals. This is a beautiful species, deserving of wider cultivation than it receives at present, that is where room can be found for its accommodation; the petals are not so formal as is the case with the ordinary run of Camellias. *W. Harrow, Sheffield.*

GHENT QUINQUENNIAL.

We have in the following report dealt as fully as possible with the more interesting exhibits. In the leading article a general description of this beautiful show will be found, and therefore we need not allude further to that matter.

The Orchids.

These plants, arranged in the great hall, may be said to be the foremost and most remarkable display of the whole show, the tastefully-arranged background of mirrors, crimson velvet, and tapestry, and the richly-draped alcoves, allowing of the varied and lovely plants appearing to the best advantage. The main groups were very fine, but some of the special classes were weak, perhaps in consequence, and some were not represented. For the accommodation of the competitors for the coveted prize, the Gold Medal given by His Majesty the King for the best collection of 100 exotic Orchids, a circular stage, 30 feet in diameter, was placed in the centre of the rotunda, and this being equally divided, was occupied on the one side by the grand exhibits of M. Jules Hye-Leysen, of Coupure, Ghent, and on the other by those of that liberal and enthusiastic amateur of Orchids, M. Georges Warocqué, of Mariemont, and in these two grand collections, which, taken together, formed perhaps the finest stand of Orchids ever exhibited, much of the interest centred. Inspection soon revealed the fact that M. Jules Hye had the advantage, his collection containing some phenomenal specimens, and being arranged cleverly, not to hide any one of the important objects. The Gold Medal given by the king was awarded to M. Jules Hye, and the second Prize Gold Medal went to M. Warocqué. Where all were good, it is difficult to make a selection, but some of the beauties grouped together in M. Hye's collection could be at once singled out. Foremost among these were the superb Cypripedium Laurebel × var. Hyeanum, with its rich vinous crimson-tinted flowers and shining wax-like texture; Cattleya Lawrenceana splendens, a brilliant variety, with the petals dark purplish-crimson like the lip; Lycaste Poelmani, with brownish sepals, yellow petals, and the lip thickly set with long hairs. (It is probably a form of L. lasioglossa, Rchb. f.) Miltonia Bleuana superba ×, a charming hybrid; Cypripedium tesselatum porphyreum ×, and the beautiful C. Lawrenceanum Hyeanum; while among Odontoglossums there were many unique things, of which it was difficult to judge the origin. Among these were O. pulcherrimum, like a good O. crispum, but with Wilckeanum spotting and lip; O. nobile, a beautifully-spotted variety, with some trace of O. Hunnewellianum; O. Wilckeanum albens; and among the other rich forms which can be identified with O. crispum, the fine rose and purple-spotted O. c. Wrigleyanum; and among Pescatoreis, the pure white O. P. album, the noble O. P. grandiflorum, and some superb violet-spotted varieties. But turning to the larger specimens in the elevated centre, beneath the noble specimen of Cocos insignis (an exhibit of M. Em. De Cock), which crowned the whole, we find grandly-flowered plants of Cymbidium Lowianum, Dendrobium Dalhousieanum, Epidendrum radicans, E. O'Brienianum, Oncidium sarcodes and other elegant Oncidiums; Dendrobium Wardianum, Ada aurantiaca, with about 100 spikes; Dendrobium thyrsiflorum, with twelve huge heads of bloom; Lælia Boothiana, shown under its old name Cattleya lobata; Masdevallia ignea, with 200 flowers, and other species proportionately large; Cymbidium eburneum, with twenty flowers; the charming Dendrobium nobile Ballianum, grand forms of Cattleya Mendeli, and other Cattleyas and Lælias, and indeed a wealth of beautiful flowers on superbly grown plants at all points. M. Hye must be complimented in the example he has set Orchid amateurs in all parts of Europe.

Almost equalling its rival collection was that of M. Georges Warocqué, so fine indeed were the specimens, that it required the eye of a connoisseur and the dividing line in the stage to detect that the whole had not been staged by one exhibitor. In M. Warocqué's collection, the Odontoglossums were very fine, and especially the white O. Warocqueanum, whose only colour is the yellow on the column, and some chrome-yellow marks in the lip; the many hybrids of the O. Andersonianum section, viz., O. Warnbekeanum, O. Bleichroderianum, O. hebraicum, &c. Of other Odontoglossums, the wholly yellow O. Canari resembled an unspotted O. Leeanum; O. crispum lilacinum, and a noble O. Wilckeanum, which looked more like a fine spotted O. crispum, were remarkable. At the back of this fine collection were specimens of Oncidium ampliatum covered with flowers, Vandas, Dendrobes, Cypripedium Lindleyanum, Cymbidium Lowianum, with a score of fine spikes; a noble Cattleya amethystoglossa, with three large bouquets of flowers, and handsome Cattleyas, Lælias, &c., and among the prettiest of the smaller species were Zygopetalum Lindeni, Cochlioda Noezliana, and C. vulcanica grandiflora.

Next in interest, to the botanist, at least, came the collection of M. Alf. van Imschoot, Mont St. Amand, Ghent, which was arranged to face the central stage, and which justly secured the Gold Medal offered for the greatest number of species of Orchids, embracing, as it did, more than 220 distinct species. An attractive feature was a trained piece of Vanilla planifolia, bearing seed-pods such as are grown in the tropics for commerce, but which are not often to be observed on these plants in Europe. Beside this, the baskets of Orchids hanging from the brackets overhead, and the noble specimen of Cymbidium Lowianum, the slender but profusely-flowered Epidendrum Wallisii, the bright and fresh-looking Vandas, Cattleyas, and Lælias, made a pleasing effect. In the centre was a plant of the true Vanda insignis, and among a host of interesting things were Dendrobium cymbidioides, D. Kingianum albidum, D. McArthiæ, Lycaste fulvescens, with many flowers; Zygopetalum gramineum, Cœlogyne sulphurea, Vanda alpina, Cyrtopodium cardiochilum, Galeandra Devoniana, Odontoglossum cristatum, a very richly-coloured O. polyxanthum, Ansellia africana, Brassias, Ericas, &c., truly a very remarkable exhibit.

In class 60, that for forty Cypripediums and Selenipediums, M. Ed. Pynaert van Geert, Ghent, showed a superb collection, the plants fresh and healthy, and the flowers fine. They were, moreover, arranged with much art. The plant of the fine variety of Cypripedium Sanderianum represented that remarkable species in the best form we have as yet seen it. Among the best we noted the new Cypripedium Barberryanum ×, C. Pollettianum ×, C. Dauthierii Rossii ×, a very remarkable variety; C. Harrisianum Fournierii ×, also distinct; C. Druryii delectum, C. Wendlandianum ×, the true C. Elliottianum, quite distinct from the fine C. Rothschildianum near it; C. nitidissimum, with nine flowers; C. caudatum, C. Chamberlainianum, C. Doris ×, C. plunerum ×, C. festum ×, C. Boxalli atratum, and others, extra fine. The collection secured the premier Gold Medal in this class, the next best going to M. J. Moens, of Lede, for a smaller, but still very meritorious collection.

Opposite the Cypripediums of M. E. Pynaert van Geert was the fine collection of fifteen exotic Orchids with which M. De Smet-Duvivier took the 1st prize, and which included a beautiful Lælia purpurata with about twenty flowers; Angræcum sesquipedale, well flowered; Cymbidium Lowianum, Cœlogyne Massangeana, Cattleya Mendeli, and C. Trianæ, in great beauty; Oncidium phymatochilum, &c., the whole tastefully arranged with Areca lutescens and Maidenhair Ferns.

In class 19 (seventy-five exotic Orchids), as in all the other classes in which he competed, M. Chas. Vuylsteke, Loochristy-lez-Gand, showed well, his Odontoglossums being superb in growth and in flower, and embracing many rare varieties and hybrids. He secured the 1st prize Gold Medal in this class, and well deserved it. In the centre was a grand Cymbidium Lowianum, with a bright-tinted Cattleya Skinneri, giving a very effective bit of colour; behind it, on each side, were large Phaius and a number of Masdevallias. Cattleya Schroderæ Cypripedium grande superbum, &c., were noteworthy.

M. Fl. Pauwells, of Antwerp, was 1st for thirty exotic Orchids (amateurs), with a pretty group, in which were Ansellia congoensis, Lælia superbiense, Vanda suavis, V. tricolor, V. gigantea, Cattleya Law-

renceana, &c.; and Dr. Capart, Brussels, secured a similar award for fifteen exotic Orchids (amateurs), his Cattleyas, Cypripediums, Cattleya Skinneri alba, and Lælia purpurata being specially good.

In the classes for single specimens, for the best Cattleya, M. Georges Warocqué, Mariemont, was 1st, with a grand C. Mendeli; and M. de Vincke-Dujardin, 2nd. For the best Vanda, M. R. Lemoinier, Lille, was 1st, with a noble V. gigantea. For the best Cymbidium, M. Alf. van Imschoot, was 1st, his exhibit being a good C. Lowianum. For the best Dendrobium, M. de Vincke-Dujardin carried off the prize with a neat specimen of D. nobile. For the finest Cypripedium, M. R. Lemoinier, Lille, was 1st, with C. Lemoinieri ×, and Messrs. Pitcher & Manda of Hextable, 2nd, with C. Greyanum ×. M. de Smet-Duvivier secured the Medal offered for the best Odontoglossum crispum (Alexandræ), with a splendid example; M. De Vincke-Dujardin that for the best Lycaste, with a grand L. Skinneri alba, with nine flowers; M. R. Lemoinier that for the best Odontoglossum other than crispum, with O. Edwardii; the same exhibitor also taking 1st for the best Oncidium. The Medal offered for a single specimen exotic Orchid, remarkable for its good culture and profuse flowering, fell to M. Alf. Van Imschoot, for a perfect specimen of Ansellia africana, with sixteen spikes of flowers. Messrs. Vervaet & Co., Mont St. Amand, took 1st for an Orchid of recent introduction not in commerce, with the clear yellow O. Masereelianum; M. Vuylsteke, 2nd for O. Tovarensis, a singular freak, like a rudimentary O. Pescatorei; and the prize list credits Messrs. Heath & Son with the Silver Medal for the best new hybrid Orchid, we suppose for their beautiful Odontoglossum excellens Tresederianum ×; we failed to find the award on the plant. Messrs. Heath & Son also exhibited Masdevallia Heathii × and other Orchids.

In class 61 (amateurs), twenty Cypripediums, M. Fl. Pauwels was 1st.

In classes 65, 66, new Cypripediums obtained by hybridisation, Messrs. Vervaet & Co., Mont St. Amand, was 1st, with C. Mons. de Curte × (Boxalli × insigne Chantini), C. × Madame de Curte, the same cross, but less spotted; C. Vandewielianum × (Boxalli × Spicerianum), C. Vervaetianum × (Lawrenceanum × Veitchii), C. Denisianum × (Boxalli × Spicerianum), and C. Huybrechtianum × (Spicerianum × hirsutissimum), the last-named (which is like a light-coloured C. × Ceres) from the same exhibitor, being 1st for the best hybrid Cypripedium; the 2nd being the C. Greyanum × of Messrs. Pitcher & Manda. Messrs. Pitcher & Manda were also 2nd for six new hybrid Cypripediums, with a very worthy collection.

It seems an endless task to touch ever so lightly on each of the numerous fine exhibits, but mention must be made of the very fine lot of ten Cattleyas and Lælias (nurserymen) which M. De Vincke-Dujardin, of Bruges, staged in class 72 a very beautiful C. intermedia, occupying the centre, with good C. Lawrenceana, C. Schroderæ, with nine flowers; Lælia purpurata, L. cinnabarina, &c., around; of the fine Vandas of the same exhibitor, which took the 1st prize in their class; the prize collection of twelve Dendrobiums of M. Alf. Van Imschoot, and the very beautiful collections of Odontoglossums, which were staged by all the exhibitors of that genus without exception. Among them were M. Chas. Vuylsteke's 1st for a collection of thirty Odontoglossums; M. Geo. Warocqué 1st for a collection of fifteen Odontoglossum (amateurs); M. Peeters, Brussels, 1st for a very fine collection of fifteen Odontoglossums (nurserymen); and Messrs. Vervaet & Co., Mont St. Amand, 1st for the best six O. crispum. M. L. Duval, of Versailles, also arranged a grand lot of O. Pescatorei.

M. H. Pauwels took 1st for twenty Cypripediums (amateurs), and various other exhibitors contributed good Orchids, not the least admired of which were the splendid arrangement of cut Orchids in three large vases, set up by M. A. Van Heede of M. St. Amand, and the chastely beautiful and novel white Eulophiella Elisabethæ, one of the finest introductions of l'Horticulture Internationale, Brussels.

But turning from the showier beauties, we, like most of the visitors, were arrested by a very pretty group of wondrously beautiful terrestrial Orchids, which were the only exhibit in class 91, twenty Orchids for the open ground, and these were staged by that enterprising and enthusiastic nurseryman and bulb-grower, Mr. C. G. van Tubergen, jun., Zwanenburg, Haarlem, and consisted of neat well-grown plants of the following and other species, viz., Orchis Robertiana, O. provincialis, O. Bancroftii, Ophrys aranifera, O. fusca, O. speculum, O. tenthredenifera, Aceras anthropophora, Habenaria dilatata, Cypripedium acaule, C. pubescens, C. fasciculatum, &c., the pretty little collection displaying more quaint beauty and variety in the small area occupied by it than any other similar space in the whole exhibition.

New Plants.

These formed a specially important feature, and were for the most part set out in the galleries. The greatest interest centred upon the class for six plants, flowering or otherwise, and as recorded on p. 480, Messrs. Sander & Co., St. Albans, were 1st, winning the Silver-gilt Medal; and M. Linden, of Brussels, 2nd. In the next class, the Silver-gilt Medal was awarded to M. Duval, Versailles, for six new plants, in or out of flower, and not in commerce, and he exhibited Pteris Victoria var. splendens, a beautifully variegated form, graceful and pleasing, the colour quite silvery and distinct; Vriesia hybrids, as V. splendens major, V. fenestralis ×, V. f. variegata, V. f. × fulgida, and V. splendens var. minor. The Silver Medal of the 2nd class went to M. Frœbel, Zurich.

In the class for a hardy plant, new, and not shown at any exhibition of the Society, Mr. Van Tubergen, Haarlem, won the Silver Medal of the 1st class, with the beautiful Iris Lorteti, one of the most distinct of the Oncocyclus group; whilst in the class for a stove foliage plant the chief place was occupied by M. Pynaert Van Geert, Gand, with Hypolytrum Schraderianum, a bold handsome plant, with fine broad deep green leaves finely curved, described in our colums at p. 414. The Silver Medal of the 1st class for a flowering greenhouse plant was awarded to M. Krelage, Haarlem, who had the new Richardia aurata, which has deep green leaves blotched with silver, the spathe cream-coloured. M. Vuylsteke, Loochristy, had the Silver Medal, 2nd class, for one hardy flowering plant with Azalea nepalensis, which is of the A. rustica type, the flowers rose-coloured and very bright. The Silver Medal of the 1st class for one seedling stove foliage plant went to M. F. Collumbien, Ghent, for a variegated-leaved Cliveia, very distinctly and attractively marked.

A very charming exhibit won the principal Silver Medal in the class for one hardy foliage plant, M. Sallier, Neuilly, France, having Nicotiana colossea variegata, the leaves broad, of a fine bold shape, and glaucous and green and white variegated, very pleasing.

An interesting class was that for ten plants in flower or otherwise, sent out since 1890. MM. Jacob-Makoy & Co., Liège, secured the Gold Medal, value 50 francs, for good plants, amongst them being Hypolytrum Schraderianum, Nidularium Makoyanum, foliage green, striped with yellow; Pandanus Baptisti, the foliage of a fine deep green colour, and very handsome; and Maranta iconifera argentea, with silvery variegation.

A class of importance was that for a new plant from seed recently introduced. The 1st prize, a Gold Medal, value 100 francs, was offered by M. le Baron Chandon de Briailles, President of the Society of Horticulture and Vine Culture, Epernay, and was awarded to M. Vuylsteke, for Azalea mollis var. alba plena, a pretty semi-double variety, white, with a yellow centre.

Dr. Wendland showed a very interesting new plant from the neighbourhood of Kilimanjaro named Saint Paulia ionantha. The plant is a Gesnerad with exactly the habit and general appearance of Ramondia. It is to be figured in an early number of the *Garten Flora*. The Senecio sagittifolius figured in our columns, p. 355, fig. 50, was shown by the same exhibitor.

Stove Plants.

The group comprising the stove plants was of importance, and many beautiful things were to be seen, amongst Crotons and Dracænas in particular. One of the chief classes was that for twenty-five fine foliage stove plants, the 1st prize, a work of art, was won by M. Em. de Cock, Ghent. He showed many old favourites, such as Pandanus Veitchii, the finely-marked Vriesia hieroglyphica, Dieffenbachia Bausei, Dracæna Lindeni, Pothos aurea, Begonia maculata, Anthurium crystallinum, and the distinct Maranta Makoyana—all the specimens very creditably grown.

The next class was for twelve plants with variegated foliage, the Gold Medal being awarded to the Société Horticole Gantoise, and we noted similar plants to those named above, as Pandanus Veitchii, Leea amabilis, Croton Andreanus, Vriesia hieroglyphica, Dieffenbachia Bausei, and Maranta zebrina.

Nepenthes were not remarkable, but a very good collection of fifteen won the Gold Medal for Mr. A. Dallière, Ledeberg, who exhibited the types N. Wrigleyana, N. Curtisi, N. phyllamphora, N. Hookeriana, and N. Rafflesiana. The Silver-gilt Medal for six Nepenthes, conspicuous for their fine culture, went to M. Fl. Pauwels, Antwerp, N. Wrigleyana being perhaps the finest of them. M. Louis de Smet, Ledeberg, won the 2nd place; whilst for a single specimen, the premier honour was awarded to M. Louis de Smet, who had a good example of N. Mastersiana. The collection of forty fine-leaved Begonias from M. G. Morel, Mont St. Amand, was not remarkable for good culture, although interesting for the great number of varieties exhibited. The 1st prize was withheld, thus the 2nd only went to this exhibitor. B. Lucie Closson, green and reddish leaved, and B. fulva, with silvery foliage, were the two prettier.

M. Rodigas, the director of the School of Horticulture, Ghent, was 1st, taking the Silver-gilt Medal for twenty-five Coleus, and we noted amongst them some very finely-coloured kinds, the plants neatly grown. M. L. de Smet-Duvivier was the only exhibitor in the classes for twenty and ten Marantas, but the plants were very creditable. In the former class of this collection, the latter to be of specimen-size, we noticed excellent M. amabilis, M. Makoyana, M. Massangeana, M. musaica, M. Veitchi, and M. Wioti; whilst of the ten specimens, M. Lindeni, M. zebrina, M. Makoyana, and M. Warscewiczi were very good. The Crotons were worthy of record. The best fifteen plants, which won the 1st prize and the Gold Medal, came from M. Dallière, Ledeberg, who had the varieties Baron Jas. de Rothschild, Madame Baillon, green, with yellow variegation; Countess, M. Leroy, Regalis, and Carrieri. M. Duval was 1st for eight Crotons, Marie Duval, Baronne de Rothschild, and magnoliæfolius, being the best. Several classes were devoted to Dracænas. The chief was for thirty plants in variety, the Gold Medal going to M. L. de Smet-Duvivier. We made note of the useful D. albo-marginata, D. Baptisti, D. Baueri, D. Doucetti, D. Goldieana, D. indivisa, and its variety, lineata; D. mortfontainensis, D. terminalis, D. stricta, and the variety alba; the foliage was of good colour, and the plants well grown. The Gold Medal was gained by Mr. J. E. Story in the class for twenty Dracænas with finely-coloured leaves, D. Wilsoni and the crimson-hued D. stricta being excellent. There was good competition, M. O. Wattecamps-Swellen, Ghent, 2nd. The most beautiful seedling Dracæna not in commerce was shown by M. Van Coppenolle, Meirelbeke, a narrow-leaved variety, graceful, with green leaves, variegated with a lighter hue. The exhibition was made gay with such classes as those for twelve D. Lindeni, and the splendidly-grown plants, compact, and of fine colour, from M. F. Buysse, Meirelbeke, were very praiseworthy; also those from M. Van Coppenolle, the former winning the 2nd prize. Also of note were the twelve prize plants of Dracæna Massangeana, well grown in every way from Mr. J. E. Story, Ghent.

The best-grown specimen of a stove Dracæna came from the last-named exhibitor, who had D. striata aureo-lineata, which, while being like D. Lindeni, is not so rich in colour.

Bromeliads.

These plants one expects to find in good character at Ghent, and there were several noteworthy groups of them, and about a dozen classes. The finest thirty plants came from M. Poelman-Maenhout, Mont St. Amand, who showed remarkably well-grown specimens, amongst them in particular several species of Vriesia, as V. fenestralis Moensi, V. Barilleti, V. hieroglyphica, V. Leodiensis, and some Nidulariums—N. rutilans, &c. The winning collection of fifteen plants in bloom, from M. R. Grenier, Mont St. Amand, was excellent, and good examples were to be seen in Caraguata cardinalis, bright scarlet colour; Vriesia Leodiensis splendens, and Nidularium pictum.

MM. Jacob Makoy et Cie. had the best fifteen fine specimen plants, showing well seven Vriesias, V. hieroglyphica being particularly good, and V. canistrum, green, blotched with a deeper shade. One of the finest examples in the show was the specimen Vriesia hieroglyphica from M. J. Apers, Loochristy, which was awarded a Silver Gilt Medal. It was fine in colour, and a very shapely plant. The best example in bloom is V. trifurcata, from M. Duval, Versailles; and he showed the finest three new hybrid Bromeliads, viz., Vriesia Aurora, V. Kittel-

liana, and V. Wioti. A new hybrid, not yet sent out, provides one class; M. Duval winning the chief Medal, with Vriesia Devansayana, the Silver Medal going to MM. Jacob-Makoy et Cie., for a new introduction, namely Hoplophytum Makoyanum. There were several other classes. Thus, the finest example of Aralia Chabrieri came from M. Van Coppenolle, and the best Croton from M. J. De Cock, a specimen of C. magnifolius, very finely-coloured, green and yellow. We may mention that M. Pynaert van Geert showed the finest Cyanophyllum, a specimen of C. magnificum. Philodendron Sellowianum was the finest specimen, and was shown by M. L. de Smet-Duvivier.

Anthuriums.

These plants made one of the finest features of the exhibition, and formed masses of brilliant colour, which was relieved by the fronds and leaves of the Ferns and Palms.

A splendid group of twenty-five plants in spathe was shown by M. Louis de Smet, whose exhibits comprised chiefly varieties of A. Andreanum and A. Scherzerianum. Of A. Andreanum, very beautiful was Roi des Belges, with spathe of a salmon colour; A. A. Ferrierense and A. A. candidum; whilst A. Scherzerianum var. atro-sanguineum was very deep in the colouring of the spathe; A. S. album, and A. S. salmoneum were also noteworthy. The names suggest the colours. The classes for varieties of A. Scherzerianum with red spathes were well filled, and the plants very finely shown, each a picture of crimson colouring. The finest twenty examples were shown by M. Warocqué, Mariemont, who deserves high praise for his excellent exhibit; and we may record that M. Louis De Smet was 2nd, whilst in the class for twelve specimen plants the Gold Medal was again won by M. Warocqué, the examples being worthy of all praise; 2nd, M. J. Moens, Lede. One cannot say more than this.

A more interesting class, perhaps, was that for twenty specimens of this species, and the Gold Medal group from M. Vervaene-Vervaert, was excellent, containing, as it did, many charming varieties, as Leopold II., crimson; La Congolaise, crimson; Rothschildianum, La Reine, white; Grand Sultan, deep crimson; giganteum, also of a fine crimson shade; tigrinum, and Wardi. The 2nd place was taken by M. Louis de Smet.

Still two more important classes occur, one for twelve plants, the spathes to be spotted and striped, and the finest in this class were from M. Vervaene-Vervaert, but they were very much alike. The best six were shown by M. A. Peeters, St. Gilles-lez-Bruxelles, one of the most pleasing forms being Comte de Bousies, enriched with scarlet, on a white ground.

The best plant of the crimson-spathed type was shown by M. Warocqué, a superb example, full of colour, and in every way excellent; whilst in the corresponding class for a spotted spathed variety, M. Louis de Smet was 1st with Madame Arthur de Smet, the spathe having a yellowish ground, spotted with light red. We may dispose of the three classes set apart for A. Andreanum, by mentioning that M. Louis de Smet had the finest specimen with spotted spathes; and in the other two classes, one for a hybrid, and the other for a seedling, an excellent seedling, full of promise, the premier awards were taken by M. Vervaene-Vervaert.

An interesting exhibit consisted of ten Dieffenbachias, comprising D. Bausei, D. Rex, and others, from M. Em. de Cock; whilst the Gold Medal for fifty Caladiums went to M. Ad. D'Haene, Gendbrugge, the plants small, but with well-coloured leafage. A few of the best varieties were Raymond Lemoinier, Automne, almost white, with silvery blotches; Chelsoni, Alfred Bleu, Candidum, and many of the leading varieties.

The Silver Medal for a fine-leaved Anthurium, was awarded the Comtesse de Kerchove de Denterghem, Château de Beirvelde, Gand, for A. ellipticum, a very fine type.

Palms.

These plants gave great relief to the masses of colour in the flowering plants, and there were numerous classes devoted to them. The chief was for a collection of twenty-five specimens, and the 1st prize, a work of art, offered by the Comte de Kerchove de Denterghem, was awarded to the Société Horticole Gantoise, Ghent. These plants were very fine, particularly Elais guineensis, Kentia Fosteriana, K. Belmoreana, Phœnicophorium sechellarum, Areca Baueri, Corypha australis, Chamædorea elegans, and Rhapis humilis. The Gold Medal was awarded to MM. de Smet Frères, Ledeberg. Amateurs were not well represented. The work of art offered for a collection of fifteen specimens, was awarded to M. De Ghellinck de Walle, and very fine were his Areca sapida, Thrinax graminea, Kentia Belmoreana, and K. Fosteriana. A class was also provided for the same number of examples, nurserymen only to compete. Kentia Fosteriana was fine, also Latania borbonica, Areca lutescens, Glaziova insignis, Rhapis flabelliformis, and Sabal Blackburniana. An important class was for twenty rare kinds, and an interesting collection was shown by M. Em. de Cock, who had amongst others, Phœnix Rœbelini, Latania rubra, Elais guineensis, which was frequently to be seen in the exhibition; Licuala grandis, Cocos Weddeliana, Livistonia ferruginea, Verschaffeltia splendida, and Rhapis humilis.

The most beautiful collection of specimen greenhouse Palms were those from M. L. Spae-Vandermeulen, who had Areca Baueri, Phœnix reclinata, Latania borbonica, Kentia Fosteriana, and Cocos Bonneti.

Eight fine Kentias were those from M. Em. de Cock, which won the Gold Medal. K. Fosteriana was again in evidence; and the same number of Cocos, well shown, obtained a Gold Medal for M. Louis de Smet. C. Weddeliana was in good character. M. C. Petrick had the Silver-gilt Medal for six Palms of recent introduction, and showed, amongst others, Rhopaloblaste hexandra, which was exhibited at a recent meeting of the Royal Horticultural Society.

For a new Palm, not yet in commerce, M. P. Breinig, Mulheim, was 1st, with Kentia canterburyana folius-aureo variegatis, a variegated variety, not likely to be of great value in gardens, we think. Kentia Dumoniana, a distinct and handsome Palm of green colour, was exhibited by M. L. Spae-Vandermeulen, in the class for a recently-introduced Palm, and gained the 1st prize. No less than twenty classes were devoted to single specimens, Areca Baueri, &c., and some remarkably fine examples of cultivation were to be seen, the A. Baueri from M. B. Spae being a very praiseworthy plant, as also the Latania borbonica from the Comtesse de Kerchove de Denterghem.

M. Vervaet-Vervaene was a successful exhibitor, having the finest Areca sapida, Phœnix tenuis—a splendid example, and Washingtonia robusta. Kentias Fosteriana, Canterburyana, and Belmoreana were in fine character. These classes of distinct Palms were amongst the most interesting in the show. The Cycads made neat groups. The chief class was that for fifteen specimens, and the winners of the chief prize were MM. de Smet Frères, who showed especially fine plants of C. circinalis, C. tonkinensis, Macrozamia villosa, and M. Shepherdi. Much the same species were shown in the class for eight, where MM. de Smet Frères again came to the front with fine plants, and also for a new Cycad, exhibiting C. Shepherdi, a bold growing form, of fine colour. Very good were the Pandanads, and MM. Jacob-Makoy et Cie., won the Gold Medal for ten specimens. We made especial note of the excellence of Pandanus ornatus, P. Veitchi, P. Desmetianus, and P. Kerchovei. M. Spae-Vandermeulen showed splendid plants of Pandanus Veitchi, and won also for three specimen Pandanads, showing P. glaucus, P. Kerchovei, and P. ornatus. The finest single specimen was one of P. ornatus. A Silver Medal of the first class was awarded to M. Pynaert van Geert for a new and beautiful Pandanus discolor.

Azaleas.

The Azaleas were the most important plants for effectiveness in the exhibition. The competition in these classes is, as a rule, very keen at Ghent, and an important feature was that for sixty specimens, in not less than thirty varieties. Much interest was centred on the awarding of the prizes, but the most victorious was M. B. Maertens, Laetham St. Martin, who won this, the work of art value 200 francs, offered by MM. de Smet, in memory of their father. The varieties were, as a rule, well known, and the plants throughout very fine, being masses of bloom, and excellent in every way; this was one of the best exhibits in the exhibition. We may note a few of the best, viz., Triomphe de St. Amand, M. Labronne, Germania, bright rose; Violacea multiflora, dark magenta; M. L. Van Houtte, Jean Van, dark crimson; Triomphe de Gand, rose; Le Flambeau, bright crimson; Baron Nathaniel de Rothschild, deep magenta; Mdlle. Marie Ross, lovely salmon; Souv. de François Vervaene, white: Comte de la Vorre, bright red; Perfection de Gand, brilliant rose; Bernard Andreas, rosy-pink; Baronne de Vriere, white; Jean Van der Croussen, bright rose; Schyne, white; and Marie Planchon, white, very finel grown, but known to Azalea fanciers. M. Jos. Vervaene received a Gold Medal as the 2nd prize; and M. L. Vervaene the 3rd.

A class of equal importance was that for 100 Azaleas, and here M. Ad. d'Haene, Gendbrugge, was 1st, exhibiting excellent plants, well-flowered; and we made note of the following varieties as being worthy of remark:—Gloire de Belgique, white, striped with red, very pleasing; Raphael, white, lemon centre, an excellent flower; Ed. Minnie Vervaene, deep crimson; Simon Mardner, double rose, very handsome; Marie Thérèse, rose centre, frilled towards the margin, which is white; Neige et Cerise, white and cherry colour, very distinct; Reine du Portugal, white; Reine des Roses, beautiful rose colour; Souvenir de François Vervaene, white, touched with red, and fringed at the margin; Superba (Liebig), rich crimson; Reine des Belges, Flambeau, rich crimson; Bernard Andreas alba, white, touched with lemon; alba illustrata, white, an excellent variety; Daphne, white, greenish in the centre, and striped with rose; Comte de Chambord, rose, and a white margin, upper petals spotted with crimson; Mdlle. Louise de Kerchove, red, upper petals of a deeper tint, and the margin white; Herot, Apollon, &c. The 2nd place was taken by M. J. Coster, Melle; and the 3rd by M. L. Eeckhaute, St. Denis, Westrem. We noted in the last-mentioned exhibitor's lot several unusually-fine varieties, although the 2nd prize collection was superior on the whole, but the competition was very close, viz., M. Louis Eeckhaute, quite like a Camellia, flower large, and deep rose; Souvenir de Recteur Kickx, rose; Henri Heine, magenta; Ernest Fierens, crimson; Vander Haeghen, large flower, white, touched with lemon-yellow; Zoe, crimson; Victor Cavelier, bright magenta; and the beautiful Balsamiflora were good, the last named in particular.

Another very interesting class was that for twenty varieties, sent out since 1885, specimens, and the Gold Medal was awarded to M. Jos. Vervaene. These plants were of much interest, and the majority of them were sent out in the years 1888, 1889, and 1890. The finest were President Ad. D'Haene, Jean Van Eyck, President Comte Oswald de Kerchove, Nigrescens, and Ibis Rose, all of good colours.

One of the most important classes was that for new varieties, for which a work of art was offered by M. T. J. Terdel, Dresden, for twelve of the newest, and this much-coveted award was taken by M. J. Vervaene, who had the following, which we describe with moderate fulness:—Madame Romaine de Smet, a very charming flower, rich pink, set off with a white margin; Perle de Ledeberge, a lovely double-flowered white flower, excellent; President Adolphe d'Haene, single, very deep crimson, and of medium size; Le Printemps, a single flower of a crimson shade, of excellent form, and robust; Unicolor, a small flower of an intense shade of crimson, very striking; M. Joseph Vervaene, a semi-double flower, of a deep shade of scarlet, with a curious bronzy shading; Madame Joseph Vervaene, a large double flower, the colour delicate pink, with carmine spots in the centre, the margin being white; Veronica, a double rose-red flower of much beauty, the margin wavy; Castor, a bold, fine flower of attractive colour; and Odin, magenta-red flower, the markings of a deeper colour.

The Gold Medal was awarded to M. J. de Kneef, Gendbrugge, who had Ministre L. de Brunger, flowers of a salmon-red shade—very pleasing; Yvonne Blommaert, pink, spotted with red; Henri Conscience, a flower of a salmony shade—very distinct and attractive.

The classes for Azaleas were so many that it is impossible to do more than briefly refer to the more important. Thus a very interesting collection of thirty specimens was shown by M. de Ghellinck de Walle, the best varieties being Souvenir de Meyerbeer, bright rose; Eulalie Van Geert, white touched with rose; Cedo Nulli, rich magenta; Coloris nouveau, crimson; Modèle, rose, fine colour; Alba illustrata; Louise Margottin, white, and Dame M lai i, bright rose. Comtesse de Kerchove de Denterghem had the 2nd place with good examples. M. de Ghellinck de Walle was 1st amongst amateurs with twenty specimens, and in the corresponding class for trade growers, the 1st place is occupied by M. Vuylsteke with creditable examples, well grown and flowered, whilst the Gold Medal went to M. V. J. Vervaene, who had a good example of the variety Oswald de Kerchove. M. Jos. Vervaene was 1st for twelve specimens in the trade class, and the Comtesse de

Kerchove in the amateur section; in both instances the plants were of fine culture.

A very interesting class was that for twelve double-flowered Azalea indica. The Gold Medal going to M. Vulysteke, who had in fine character Deutsche Perle, Empress of India. rose, &c., all well cultivated. Madame V. Jean Vervaene had the best specimens of white-flowered varieties, and MM. Vermeersch et De Baerdemaecher, the finest double-flowered seedling Azalea, a good variety, the flowers large, of crimson colour, and of firm texture. They were also 1st with one single-flowered seedling.

The best Seedling Azalea, not yet in commerce, was exhibited by M. P. E. De Cock, in Adversaire, the flowers large, rose, with deeper-coloured spots. M. De Ghellinck de Walle and M. Vervaene-Vervaert were also successful exhibitors. Azalea mollis were very fine. A beautiful collection came from M. Pynaert van Geert, the various varieties displaying great range of colour, Leon Pynaert, M. A. de Cock, Françoise Hevor, Comte de Kerchove, Alphonse Lavalleé, Ernest Bach, Madame Delme, and Madame A. Verschaffelt. The 2nd prize was awarded to MM. de Smet Frères.

In another class, one for hybrids of A. mollis × A. sinensis, the premier place was taken by M. A. Koster of Boskoop, the well-known Azalea grower, who, as might be expected, showed a very charming collection, the flowers remarkable for brilliancy of colouring, size, and form. A few of the striking varieties are Dr. Masters, Emile Durien, Emilie Dupont, Jules Closson, Mr. Harry Veitch, J. H. Laing, A. F. Barron, and Victor Philippot; the Silver-gilt Medal went to M. Pynaert van Geert. For a collection of twelve plants, A. mollis hybrid, with double flowers; A. rustica, fl.-pl., the chief award was made to M. Vuylsteke, the finer kinds shown being Hora, yellow, with deeper centre; Norma, salmon-red; Byron, white; and Ariadne, white, very pure, and pleasing. M. Pynaert van Geert had the most beautiful six single-flowered plants, remarkable for colour, vigour, and freedom of flowering, a delightful exhibit. We may also praise the thirty plants of spotted varieties of A. mollis, which were a source of attraction from M. L. de Smet, whilst M. Vuylsteke had the best specimen.

Rhododendrons.

The Rhododendrons were very creditable, and the most interesting class, perhaps, was that for twelve new varieties; the Silver-gilt Medal going to M. Vervaene-Vervaert, who had many lovely plants, and we may mention as noteworthy the following:—Marie Thérèse, white flowers, upper petals spotted with dark crimson; Memoire du P. Bodouin, rose, claret-coloured spots; Gedeon, rose; Bossuet, rosy colour, with dark spots; Jules Cæsar, also of a rosy shade; Fenèlon, crimson, dark spots; Juliette, lilac; and the delicately-coloured Jeanne d'Arc. M. Seidel gained the Silver-gilt Medal for a seedling variety, and M. Pynaert van Geert, the finest specimen. There were, however, several large collections of Rhododendrons. Thus the finest forty specimens came from M. Cocquyt-Fortie, Ghent, who showed well, noteworthy being Star of Ascot, Stella, Michael Waterer, Helen Waterer, Mrs. John Clutton, Raphael, Mrs. John Waterer, Etendard de Flandre, and Vesuvius.

A splendid collection was that from M. Pynaert van Geert, which gained the Premier Prize—a work of art; and we noted an exceptionally good gloriosum, white touched with rose; Lord Stamford, crimson, and G. Cunningham. Among Mr. Pynaert's exhibits were found hardy Rhododendrons in bloom, fine plants, and sturdy specimens:—Madame Carvalho, flowers white, with greenish-brown spots—more than 6 feet across; Madame Louis Van Houtte, tender, rose-coloured at the edges, the centre part white, tinged with flesh-colour, blood-red spots; Mrs. John Penn, flowers salmon-red, centre clear; Stella, flowers rosy-lilac, blackish-crimson spots; Mrs. R. S. Holford, flowers red, slightly salmony—a plant 6 feet across; Charles Baglay, flowers carmine, tinged with lilac, spots coppery-bronze—plants 6 feet across; Prince Camille de Rohan, a variety very popular among florists for culture in pots, and sale in the market. Flowers white, bordered with rosy flesh-colour; a large brown spot, borders wavy; plant 6 feet across. Vesuvius, brilliant cerise-red. All the other plants were from 4 to 5 feet across. A collection of twenty-four specimens from M. Em. De Cock was worthy of note, as also were the same number of spotted varieties, from M. L. Spae-Vandermeulen. The best seedling came from M. Seidel. A very interesting class was that for hybrid Himalayan Rhododendrons and Java kinds, and one saw good examples of each type in R. Sesterianum, Queen Victoria, W. J. Standish, a pleasing white flower, &c.

The Ferns

were either of ordinary merit, or, as in some of the classes for collections other than Tree Ferns, and for special genera, below the average, as witness the number of 1st prizes withheld. Two of the finest of the new or rare class, but not offered in competition as single specimens, were the Alsophila atrovirens, staged in the 1st prize group of new plants, exhibited by Messrs. F. Sander & Co., and their beautiful Hæmidictyon marginatum, with its massive yet elegant fronds of a charming tint of green. The variegated Adiantum cuneatum of Messrs. Pitcher & Manda, the United States Nursery, Hextable, Swanley, also came in for a large amount of attention, especially among florists. Varieties and probable hybrids of Pteris Victoria were exhibited as novelties by various exhibitors, and the Pteris Rex of M. De Smet-Duvivier seemed likely to make a good market plant of the P. tripartita type. Tree Ferns were as usual at Ghent well represented; the collections of thirty, set up by M. de Ghellinck de Walle (1st prize), and by Madame la Comtesse de Kerchove de Denterghem, were very fine; and also good was the collection of thirty Ferns with which Messrs. Duriez, père, of Wondelghem, took the Medal in Class 233. Other good exhibits were the 1st prize eight Tree Ferns of Messrs. De Smet Frères, and the 2nd of M. Louis de Smet; the prize collection of Filmy Ferns of M. Louis de Smet; the collection of twenty Adiantums of Messrs. Duriez, of Wondelghem; the pretty six Platyceriums of M. Jules de Cock, Ledeberg; the fine single specimen Platycerium of M. A. de Meyer, Gentbrugge, and the large Adiantum Farleyense, shown by Messrs. Vermeersch and de Baerdemoecker. Selaginellas were but indifferently represented.

Camellias.

These plants werewell worthy of note, especially the fine group of thirty plants from M. L. Eeckhaute which gained the chief prize. It is now late for the flowering of Camellias, but the plants have been kept back, and were shown in splendid condition. Countess of Orkney, white, striped with pink, is noticeable. M. Eeckhaute carried all before him with Camellias, and showed the fine C. reticulata, an old but worthy plant, well.

Miscellaneous Stove Plants.

These formed a very distinct group, in which many fine plants were shown. The large class for forty examples, in or out of bloom, was represented by the Ghent Horticultural Society, which received the premier prize—that established by English friends in memory of the late M. Louis Van Houtte (Père). Verschaffeltia splendens, Nephrolepis davallioides furcans, Anthurium Veitchi, Leea amabilis, and Alpinia vittata, are worth of note, whilst the same Society came 1st, Aglaonema Rœbellini being of note. The Gold Medal, we may mention, was awarded to M. L. De Smet-Duvivier. The class for twenty specimens in bloom made a change. A great assortment of plants was shown by M. L. Van Driessche-Leys, Ghent, who was 1st, thus winning the prize offered by the Queen of the Belgians. Rhododendron fragantissimum, Choisya ternata, and Polygala Dalmaisiana were the most noteworthy. M. Em. de Cock, was, it will be noticed, 1st, both for fifteen flowering, or for the same number of foliage plants, having Rhapis flabelliformis, Phormium Colensoi, &c. M. G. Tretin, Meirelbecke, won with eight plants; and Messrs. Pitcher & Manda, Hextable, Swanley, Kent, were 1st for Sarracenias and allied species; they had a fine collection of Cephalotus, Darlingtonia, &c. This firm took a Silver-gilt Medal for hybrids, also for the best specimen Sarracenia, showing a fine plant of S. Chelsoni. Very bright in effect was the show of Cliveias, and the varieties are in many cases named, but there is much sameness between them, and fewer names would be an advantage. The plants were finely grown, and made an interesting feature, particularly the bold group of twenty examples which gained M. J. Moentjens, Mariakerke, the 1st place. The Gold Medal was awarded to M. A. L. Rosseel, Tronchiennes. Two classes were provided for twelve plants, one for the trade and the other for amateurs. In the former case, M. B. Fortie won the chief award; and in the latter M. L. van der Bos, whilst MM. Blancquaert et Vermeire was 1st for six specimens. M. Vuylsteke had the finest single specimen, and Madame V. Enoeck, Gendbrugge, the best seedling, but we do not care for its dull leaden colour.

A distinctive feature consists in the four Strelitzias from M. E. Cannaert, which took the 1st prize. The species shown were S. regina, S. longiflora, S. humilis, and S. pumila. In addition a fine plant of S. juncea was exhibited by the same gentleman.

A large number of classes were devoted to specimens, with which we can only deal in a general way; but the effect of the grouping of one exhibit was very fine. Noteworthy was the immense example of Sparmannia africana from the Comtesse de Kerchove, the plant full of bloom—very handsome and striking. Choisya ternata was finely shown, the plants excellent, and full of bloom, and the best came from M. Van Driessche-Leys. A note may also be made of Cytisus racemosus, excellent plants in every way; whilst C. or Genista Andreanus was also a feature of interest; this plant is now largely grown. Another plant worthy of notice was Boronia heterophylla, and a splendid group of twenty plants coming from M. Louis de Smet.

The Gold Medal for a collection of Cape plants was won by M. Em. de Cock, who had good examples of well-known species. Illicium religiosum was shown by M. Bedinghaus, in the class for the most beautiful greenhouse plant, other than several kinds named, as Ericas, &c.

Forced Plants.

The section devoted to forced plants was a large one. A Gold Medal was awarded to M. Van Driessche-Leys, for his twenty-five forced hardy shrubs, as Tree Pæonies, Philadelphus, and Deutzias, whilst Roses formed an important feature. Considering they were forced, the specimens were in many cases noteworthy. M. Ch. Vanderhaeghen, was the chief prize-taker. The great class was that for 100 varieties. The plants shown were standards, and well-flowered; the chief varieties being Maréchal Niel, Prince Camille de Rohan, Jean Liabaud, Jean Ducher, Boule de Neige, Captain Christy, Elise Vardon, Grand Mogul, Grace Darling, Madame Falcot, Madame Paquerette, Perle de Lyon, Marie Van Houtte (excellent), General Schablikine (which has salmon-coloured flowers), and Rubens. The same exhibitor was 1st for forty and thirty plants, also having the best fifteen specimens of Maréchal Niel. M. Ernest Fierens, Ghent, had the best specimen, showing Gloire de Dijon very creditably.

The finest ten Lilacs were those from M. L. De Bock, Ghent; and M. I. Wyckaert, ainé, Ghent, and M. Em. De Cock won respectively for Hydrangeas and Deutzia gracilis.

For twelve specimen Kalmias, M. Y. De Coster, Melle, was awarded a Silver-gilt Medal. The same exhibitor showed the best single specimen, also Andromeda floribunda. We may note the twenty-five pots of Lily of the Valley of M. Louis De Smet, were well-grown and flowered; whilst a mass of crimson colouring was afforded by the prize lot of Spiræa palmata from M. A. Demeyer, Gendbrugge. S. japonica aureo-reticulata from M. J. Meirschaert, Melle, may be noted as an interesting exhibit that won a Silver Medal.

Pansies were well exhibited by M. D. Bullens, and hardy Primulas by M. J. d'Hoop, Ghent, and M. J. Collumbien.

Pelargoniums, Carnations, &c.

The Pelargoniums need not be commented upon, but a creditable collection of twenty plants of Carnation Souvenir de la Malmaison won the Silver-gilt Medal for M. O. Vander Cruyssen, and the comparatively new Madame Warocqué, which has crimson flowers, as a distinct class, the best plants being shown by M. S. Bracke, Loochristy. Cinerarias were not remarkable, nor the Amaryllis, after the splendid English hybrids. The flowers lack the lustre and massiveness that distinguish the best English-raised Amaryllis. The Gloxinias were good, although not surprisingly fine, and some of the collections were evidently damaged in transit. A very creditable collection of thirty plants of G. crassifolia came from M. Delaruye-Cardon, and some of G. punctata from the same firm.

In the varied collection of twenty Gloxinias, shown by the same exhibitor, and which had the Silver-gilt Medal, Mont Blanc, white, was in good character.

Hardy Bulbous Plants.

This is another group of much interest. The Hyacinths were not up to the mark as a rule, but the collection of fifteen plants in fifty varieties from Messrs. Byvoet, Bros., Overveen, and which won the chief prize, was a noteworthy exhibit. M. J. Kuyche, Ghent, had the Gold Medal. M. Krelage, Haarlem, showed the best 100 plants, also the finest 300 double Tulips, and M. Voet, Haarlem, the best single

variety. An interesting collection was the Darwin Tulips from M. Krelage, who was 1st. M. B. Spae showed well Lilium longiflorum var. Harrisi. In the bulb section, the exhibits of M. van Tubergen, Haarlem, were of much interest; and he won the Gold Medal offered for 100 pots of bulbous plants, which included species of Muscari, Tulipa retroflexa, T. Greigi, and T. Kaufmanniana. Hippeastrum pratense, scarlet, very neat flowers; Griffinia hyacinthina, various kinds of Anemone, Irises in variety, I. Lorteti, I. Korolkowi violacea, hybrid Lachenalias, Fritillarias, Gladiolus tristis, &c. The same exhibitor won the Silver-gilt Medal for thirty species and varieties of Fritillaria.

Ornamental Greenhouse Plants.

The largest class in this section was that for a collection of twenty-five plants, the chief place being taken by M. J. de Cock, who showed, amongst other things, Hydrangea hortensis argentea marginata, a very pleasing plant, the leafage almost white, edged with light green. The Oranges were noteworthy, and a fine colour-effect was obtained from the groups of twenty-five plants in fruit, M. Dallière, Ledeberg, winning the premier award. The Phormiums were represented by fine specimens, P. tenax in particular being huge examples; and worthy of note was the example from M. L. Eeckhaute, and the two from M. G. Fretin, Meirelbecke. M. Gyzelinck, Melle, exhibited Dracæna lineata and D. australis aureo-lineata well, whilst worth mentioning was the plant of D. Douceti from M. Pynaert van Geert. To show the extent of the exhibition, we may mention that there were classes for Myrtles, Laurustinus, and Laurels, and they were very good. M. van Coppenolle was the prize-winner for Laurels.

Hardy Ornamental Plants.

This was a rather weak section, and the competition was slight. The chief exhibitor was M. Bedinghaus, who was placed 1st for twenty variegated plants, showing Ivies, Euonymus, &c., whilst he was well to the front for twenty hardy Japanese shrubs, but as these were well known subjects, we need not further allude to them. Twelve and six creditable Euonymuses were also shown by this exhibitor. Aucubas, Hederas, Box, &c., were shown, and a satisfactory collection of twelve Pernettya mucronata won for M. Pynaert van Geert the Silver Medal.

Conifers.

We cannot praise these greatly. A collection of forty species from M. F. Burvenich, sen., Gendbrugge, was of interest, Cupressus Lawsoniana aurea being exhibited well, and this won the Gold Medal, M. Braeckman, Wetteren, having the best twenty-five examples. More beautiful, however, than this class of Conifers was the collection of greenhouse Araucarias, the Gold Medal going to M. Jacob Makoy, who had a very charming exhibit, A. Bidwilli and A. excelsa glauca being of note, the last-mentioned of a very beautiful type, the leafage quite of a clear glaucous tint, very distinct, a good ornamental plant. Several other classes were set apart for the Araucarias, specimen and otherwise.

It is interesting to notice that the Veitch Memorial Medal and prize of £5, offered for hybrids, was awarded to M. Maréchal, Liège, who had Vriesia crosses of interest, but we did not see much of great beauty, or, we should think, value either.

Succulents.

A small section was devoted to this class, and the smaller plants, we must say, were remarkably well grown, clean (if we may so express it), and of deep colour. The Gold Medal for twenty-five Agaves, Beaucarneas, &c., went to M. Bedinghaus, who was the chief exhibitor throughout. M. L. de Smet was 1st for twenty-five specimen Cactus, and for twelve Euphorbias.

Plant-houses, &c.

A section of the exhibition was for plant-houses and heating apparatus, boilers, &c., and we will briefly allude to the more important exhibits. The Gold Medal, for a temperate-house, went to Messrs. Foster & Pearson, Beeston, Notts, who exhibited a very neat and excellent structure, the chief points of which were a movable roof, the lights can thus be taken off at any time; the top ventilation is given by a movable blind, and the side ventilation is under the stage. It is heated with the Beeston boiler, built into the brickwork, and the house has strong iron rafters. It worthily gained the premier award. A neat pretty structure wins for M. E. Van Gheyt, Meirelbecke, the 2nd place. The Gold Medal Orchid-house was shown by Mr. J. B. Court, Koekelberg, the house being about 35 feet long and 22 feet wide. It is well built, fitted with wooden roller blinds, which afford, however, in our climate, a too dense shade. The ventilation was of good character, and the house worthy of commendation. M. Buss, Ghent, gets the small Gold Medal. A large exhibitor was M. Buss, who had the Gold Medal for a greenhouse, &c. The houses are well constructed, on good principles, and adapted for their purpose. The Ghent Gas Company had the Gold Medal for apparatuses heated with gas and oil—useful contrivances, but not superseded by our own types.

There was a good array of boilers. A multiplicity of tubes seemed to be the chief feature. Such displays, however, are of importance, and we are pleased to see that in this exhibition they are well represented. M. Ed. Maher had an apparatus for heating winter gardens, &c., with a boiler like our saddle; also M. Bakaert, Chaussée de Bruxelles, 35, Ledeberg, Gand; M. Ch. Bouquet, Chaussée de Bruxelles, 111, Ledeberg, Gand; M. Kerner, also of the Chaussée de Bruxelles; M. van Heddeghem, and several others, exhibited hot-water apparatus. Messrs. Foster & Pearson had a very neat and elegant apparatus, a steam hot-water radiator, which was portable. An enormous display was made by M. Dutry, Colson, Ghent, this occupying a very large space, the exhibits consisting of a variety of tools for garden work, syringes, water-engines, garden-rollers, and tents, arranged with conspicuous good taste, and one of the more interesting features of the show.

MM. Letœuf and Guion, Paris, had a variety of apparatus; and other exhibitors of miscellaneous things were M. Buss, MM. A. Delanier, Bros., Ghent; and MM. Block & Welsch, Meirelbeke; in the two latter cases the exhibits consisted of garden statues and vases.

We may mention that the Gold Medal for an amateur's greenhouse, fitted with hot-water apparatus, went to M. Fl. Van Hoecke, Ghent. M. Dutry Colson led well in the class for garden implements, gaining the Silver-gilt Medal for a most meritorious exhibit, to which some allusion has already been made.

Before closing our remarks upon this splendid show, we may say that possibly through the great difficulty experienced in learning the awards until a late hour that there may be some omissions, which will probably be made good in our next issue. A few exhibits not for competition were, for instance, of great importance, and one of the most charming plants shown was the Rhododendron named Helène Schufferer, from M. J. F. Seidel, Striesen, Dresden; the plant is of very neat and compact habit, the flowers borne in a well-shaped head, and waxy-white.

M. Lemoine, Nancy, France, showed a very charming collection of Lilacs, comprising those recently raised by them; and Deutzia parviflora, which is a beautiful Chinese shrub, the flowers small, pure white, and the corymbs forming wreaths of bloom—a delightful plant. The now popular Parrot Tulips, from M. Krelage, were worth a note for their singular form and bright colouring.

English Exhibits.

The Amaryllis from Messrs. J. Veitch & Sons, Chelsea, were placed in one of the galleries, and constituted a beautiful feature. It was quite one of the finest masses of colour in the show, every variety characterised by fine colouring, breadth, and freedom. We need write no more on the Amaryllis from Chelsea, these having been recently described in our pages (Silver-gilt Medal). In one of the plant-houses in the grounds, Messrs. W. Cutbush & Son, Highgate, N., had a collection of hard-wooded plants, Boronias, and many other things, besides Mignonette Cutbush's Giant, a very fine variety. Messrs. Blake and McKenzie, Edinburgh, had seed packets, and contrivances for filling them.

New Palms.

Amongst the new Palms we noticed Ptychoraphis Augusta shown by M. Pynaert Van Geert, which was very graceful and distinct in character; and one named Kentia Fortunei, had rich foliage, with very broad leaflets, a fine Palm. There were prizes also offered for two specimens of Phœnix tenuis, Chamærops Fortunei, and Cocos Benneti. M. de Ghellinck de Walle, M. Vander Bogaerds de Moergestel, and M. J. de Cock were the chief exhibitors.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees — a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

The following summary record of the weather for the week ending April 15, is furnished from the Meteorological Office:—

"The *weather* again continued very fine and bright in almost all parts of the kingdom. In the extreme north of Scotland, however, some slight rain fell occasionally, and by the end of the period the fall was general over Ireland and the north of England also.

"The *temperature* for the whole week did not differ materially from the normal; but it was generally low during the middle part of the period, and high both at the beginning and the end. The highest of the maxima were recorded on the 9th in Scotland, and on the 10th in England and Ireland; and varied from 70° in 'England, S. and E.,' and from 66° in 'Scotland, N. and E.,' and the north of Ireland, to 63° in the 'Channel Islands,' and to 61° in 'England, N.E.' The lowest of the minima were registered, as a rule, on the 13th, when they ranged from 21° in the 'Midland Counties,' and 23° in 'Scotland, E.,' 'England, E.,' and 'England, S.W.,' to 29° in 'Ireland, N.,' and 36° in the 'Channel Islands.' The diurnal range was again rather large at the inland stations, but less so than during the two preceding weeks.

"The *rainfall* was less than the mean in all districts. The greater part of England was again rainless, while in the Irish districts there was no more than a tenth of an inch. In Scotland the fall was more decided, amounting to between three and five-tenths.

"The *bright sunshine* showed a rather considerable decrease, but was still fairly abundant, and exceeded the mean in nearly all districts. The percentage of the possible duration ranged from 33 to 38 in Scotland, from 36 to 61 in Ireland, and from 52 to 68 over England. In the 'Channel Islands' the percentage was 59."

MARKETS.

COVENT GARDEN, April 20.

Business steady, with supplies again good. Prices generally as last week. A fresh shipment of Tasmanian Apples to hand, arriving in better condition. *James Webber, Wholesale Apple Market.*

POTATOS.

Trade for old Potatos still very slow and prices low, except for best samples, which maintain fair prices.

NEW POTATOS are arriving in large quantities, both from Teneriffe and Malta—Rounds making 11*s.* to 13*s.*; Kidneys, 12*s.* to 22*s.* per cwt. *J. B. Thomas.*

SEEDS.

LONDON: *April* 19.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write, that in spite of the long-continued and remarkable drought, there is a healthy steady demand for field seeds. A good downfall of rain is now much wanted, and would greatly increase the sale of seeds, and at the same time quickly reveal the extreme narrowness of available stocks. Quotations generally show this week no important variation. For Tares, the sale is slow. Bird seeds likewise meet a meagre inquiry. There is rather more doing in Peas. Haricot Beans are neglected. Mustard and Rape seed keep firm. Very low prices prevail for White and Scarlet Runners.

FRUITS AND VEGETABLES.

BOROUGH: *April* 18.—Quotations:—Kale, 1*s.* to 1*s.* 6*d.* per bushel; Turnip-tops, 2*s.* per sack; Broccoli, 1*s.* 6*d.* to 2*s.* 6*d.* per bag; Greens, 1*s.* 6*d.* to 2*s.*; Parsley, 3*s.*; Carrots, 2*s.* 6*d.* to 3*s.* 6*d.*; Turnips, 1*s.* 6*d.* per dozen bunches; English Onions, 11*s.* to 12*s.* per cwt.; Horseradish, 2*s.* 3*d.* to 2*s.* 6*d.* per bundle; Apples, 4*s.* 6*d.* to 6*s.* per bushel.

STRATFORD: *April* 18.—The supply at this market during the past week has been excellent, and a brisk trade has been done at the undermentioned prices:—Greens, 2*s.* to 3*s.* per bag; do., 1*s.* 3*d.* to 1*s.* 9*d.* per sieve; Cauliflowers, 1*s.* 6*d.* to 2*s.* per dozen; do., 6*s.* to 9*s.* per tally; Carrots, household, 40*s.* to 50*s.* per ton; do., cattle-feeding, 18*s.* to 34*s.* do.; Parsnips, 6*d.* to 9*d.* per score; Mangels, 16*s.* to 21*s.* per ton; Swedes, 18*s.* to 20*s.* do.; Onions, English, 220*s.* to 240*s.* do.; do., Dutch, 8*s.* to 8*s.* 6*d.* per bag; Apples, English, 2*s.* to 6*s.* per bushel; do., American, 12*s.* to 20*s.* per barrel; Cucumbers, 2*s* to 2*s.* 6*d.* per dozen; Sprouting Broccoli, 2*s.* to 3*s.* per bag; Rhubarb, 1*s.* 6*d.* to 2*s.* 6*d.* per dozen.

SPITALFIELDS: *April* 18.—Quotations:—Sprouting Broccoli, 2*s.* 6*d.* to 3*s.* per sack, and 1*s.* 6*d.* per bushel; Spinach, 2*s.* 6*d.* to 3*s.* per bushel; Curly Kale, 2*s.* to 2*s.* 6*d.* per bushel; Sea-Kale, 1*s.* 3*d.* to 1*s.* 6*d.* per punnet; Radishes, 2*s.* to 2*s.* 6*d.*; Cauliflowers, 7*s.* to 10*s.* per tally; Greens, 4*s.* to 5*s.* 6*d.*; Spring Onions, 3*s.* to 4*s.*; Parsley, 5*s.* to 6*s.* per dozen bunches; forced Rhubarb, 1*s.* to 1*s.* 3*d.*; natural do., 1*s.* 6*d.* to 2*s.* 6*d.*; Mint, 5*s.* per dozen bunches; Mustard and Cress, 2*s.* per dozen baskets; Horseradish, 2*s.* to 2*s.* 6*d.* per bundle; English Onions, 13*s.* to 18*s.* per cwt.; Egyptian do., 14*s.* to 15*s.* do.; Parsnips, 8*d.* to 10*d.* per score; American Apples, 15*s.* per barrel; foreign Tomatos, 1*s.* 6*d.* per box.

FARRINGDON: *April* 20.—Quotations:—English Onions, 12*s.* to 14*s.*; Parsnips, 40*s.* to 50*s.*; Beetroot, 2*s.* 6*d.* per cwt.; Lettuce, St. Malos, 6*d.* per dozen; Asparagus, 1*s.* to 1*s.* 3*d.* per bundle; Carrots, 60*s.* to 65*s.*, per ton.; Radishes, 6*d.* per dozen; Canary Tomatos, 1*s.* 3*d.* to 2*s.* per box; Gooseberries, 2*s.* per basket; Apples, Tasmanian, 7*s.* 6*d.* to 9*s.* 6*d.* per case; American Nonpareils, 14*s.* to 16*s.* 6*d.* per barrel.

POTATOS.

BOROUGH: *April* 18.—Quotations:—English Magnums, 40*s.* to 60*s.* per ton. Others as previously reported. New, 2*d.* to 5*d.* per pound.

SPITALFIELDS: *April* 18.—No alteration to report.

STRATFORD: *April* 18.—Quotations:—Magnums, 40*s.* to 60*s.*; Bruce's, 45*s.* to 70*s.*; Imperators, 40*s.* to 60*s.*; Scotch Magnums, 55*s.* to 65*s.*; do. Bruce's, 60*s.* to 75*s.*; Main Crop, 80*s.* to 90*s.* per ton.

FARRINGDON: *April* 20.—Quotations:—Main Crop, 80*s.* to 90*s.*; Sutton's Abundance, 75*s.* to 80*s.*; Bruce's, 60*s* to 65*s*; Magnums, 55*s.* to 60*s.*; Imperators, 55*s.* to 60*s.* per ton.

LONDON AVERAGES: *April* 19.—Magnums, 40*s.* to 65*s.*; Hebrons, 60*s.* to 70*s.*; Imperators, 50*s.* to 70*s.*; Champions, 45*s.* to 55*s.*; Belgians, 40*s.* to 50*s.* per ton. New:—English, 3*d.* to 6*d.*; Jerseys, do., 2*d.* to per 6*d.*; Guernsey Kidneys, 3*d.* to 4*d.* per pound; Canary Kidneys, 12*s.* to 16*s.* per cwt.

NOTICES TO CORRESPONDENTS.

APPLES SHOWN BY MR. W. DIVERS AT THE LAST MEETING OF THE ROYAL HORTICULTURAL SOCIETY: *X.* The bad condition of these fruits is explained by the fact that they were packed and sent off in time for the meeting of March 28 and delayed in transit, not being shown by Mr. Barron till fourteen days later.

BOOKS: *W. E. A.* Those you name are published by Watlee Burpee & Co., Philadelphia, U.S.A. *Onions for Profit*, price 50 cents; *Celery for Profit*, price 30 cents; *Manures: How to Make and how to Use them*, price 50 cents. Obtain through a foreign bookseller.

CROSS BETWEEN CYPRIPEDIUM BIFLORUM AND C. BARBATUM. *F. Henkle.* We know of no such cross having been made. They are nearly allied species, and a cross between them would probably exhibit but few variations—not enough to induce hybridisers to make the cross. C. barbatum has been used as pollen or seed parent in many instances, with the result of beautiful varieties being obtained in this country.

INSECTS: *W. A. S., W. S.* Next week.

INSECTS IN VINERY: *Dickson, Brown, & Tait.* The beetles in the vinery are Trox sabulosus, and are quite harmless to plant life. They live in dry carcasses, hides, horns, bones, &c.; this hint may perhaps enable you to account for their presence, and to find a remedy by removing the cause. Vines are sometimes "manured" with the bodies of stray cats, &c.; these on becoming dry would attract beetles of this nature. *R. McL—J. S* The insect is the destructive clay-coloured weevil, Otiorhynchus picipes, which feeds at night on buds, young shoots, bark, leaves, &c. Spread cloths beneath the Vines in the afternoon, and go into the place at night with a dark lantern, turn the light on suddenly, and the insects will at once fall on to the cloths, when you must not delay to collect them. By following this practice for a fortnight there will be considerable lessening of their numbers. Fork quick-lime into the upper crust of the Vine-border, say, 3 to 4 inches below to destroy the grubs. The present time is not too late.

INSECTS IN A BOX, BUT WITHOUT A NOTE: *J. Cowderoy.* Two black creatures were found smashed out of form. You should send others securely packed in a strong box.

IVY: *J. T. E.* There may be poisonous properties in Ivy, but we have never before heard of anyone being made ill by trimming the plant. Perhaps some of our readers who may read this note will kindly give their experiences.

KEW BULLETIN: *Ed. In. Louvain.* 1, the first number of this publication appeared on January 1, 1887; 2, the price, 2*d.* per number; 3, it is published monthly; 4, by Eyre & Spottiswoode, East Harding Street, and may be purchased of them; or of Adam & Chas. Black, 6, North Bridge Street, Edinburgh; or, Hodges, Figgis, & Co., 104, Grafton Street, Dublin.

MUSHROOM SPAWN: *Spawn.* The so-called "spawn" (mycelium) is developed from spores in horse droppings and loam under certain conditions of warmth and moisture, and naturally in manured ground out-of-doors and generally in the autumn. We do not know the exact degree of warmth the makers apply, but it would not exceed 80° in the clumps of half-dried bricks. Get Mr. Wright's book "Mushrooms for the Million," published at 171, Fleet Street.

NAMES OF PLANTS: *F. Henkle.* Triteleia uniflora; introduced from Buenos Ayres, not Palestine.—*F. R., Leicester.* Large flower, Magnolia conspicua; small one, Spiræa Thunbergii.—*Harewood, Leeds.* Dendrobium Pierardi.—*A. B.* Pittosporum Tobira and Pimelea ligustrina.—*T. D., Sheffield.* Sprekelia formosissimus.—*F. N.* 1, Chrysosplenium oppositifolium; 2, send better specimen; 3, Saxifraga hypnoides; 4, Saxifraga muscoides.—*O. O.* Doronicum austriacum.—*F. E. C., Lismore.* Anemone nemorosa Robinsoniana, the blue variety of the Wood Anemone.—*G. H.* 1, Cydonia japonica; 2, Berberis Darwinii; 3, Viburnum tinus; 4, Cerasus Laurocerasus; 5, Berberis aquifolium; 6, Ribes sanguineum.—*J M.* Next week.

RULE II. IN SCHEDULE: *C. H. S.* We cannot see any reason against your paying 5*s.*, and showing in the amateurs' class, if you so choose. A millionnaire might elect to live in a cottage, and surely he would be eligible to show as an amateur, if he paid his 5*s.*, instead of the cotter's subscription of 2*s.* 6*d.* The rule is made to serve the poorer exhibitors.

SOWING SEED OF PERPETUAL FLOWERING CARNATIONS: *W. W* It is now too late to sow seed to raise plants for winter blooming next year, and under the best kind of treatment these would not bloom before midsummer. It is generally the best practice to raise these in January in considerable numbers from the best strains, in warmth of 70°, sowing the seed in shallow pans of sandy loam and a little leaf-mould, covering the seed very lightly, keeping them in heat only so long as the first true leaf is visible, when they should go into a less warm place, and be grown on with more and more air, and less artificial warmth till they come into a cold frame in April. The seedlings should be pricked off into other pans, in rather richer soil, and they may remain in these till the end of May, when they should be planted on a sunny border in well prepared soil, at about 18 inches apart each way, which will not be found too great, as seedlings grow with much vigour. This method has the advantage over pot culture, seeing that there will be a large proportion of single flowers of small value, and many undesirable, indistinct colours, and poor forms. Having selected the best at flowering time, these may be propagated from by layering in July and August, or the plants may be carefully taken up in September, and wintered in cool frames till early in February, when by introducing them to gentle heat, cuttings may be obtained, which if struck in bottom heat of 85°, will under fair culture make good flowering plants the following winter.

THE APPLE JACQUIN: *Philomelus.* The certificates of the Royal Horticultural Society are awarded to the object shown unless otherwise mentioned, no matter who the exhibitor may be. Sometimes, in the case of a new fruit, flower, &c., the raiser's name is given.

VINES: *W. B.* The Vines are dead, and they were probably nearly so when you lifted and replanted them. The fresh soil sent is a suitable one. Plant new Canes in May or June in a growing state, if you can get them.

ADDRESS—THE CHEMICAL WORKS,
HEMEL HEMPSTEAD, HERTS.

PEARSONS' CHEMICAL MANURE.

This Manure has now been before the public for five years, and has, from its intrinsic merits, almost without advertising, forced its way into the front rank. Extensive trials during above period have convinced us, that for efficiency and cheapness, there is nothing in the market to touch it; we having employed it with the fullest success upon Vines and other Fruit Trees, Pelargoniums, Fuchsias, Chrysanthemums, and almost all kinds of Greenhouse Plants; this opinion is supported by all the gardeners who have tried it, all being enthusiastic in its praise.

Per ton, £16; per cwt., 20s.; ½-cwt., 12s.; 28 lb., 7s.; 14 lb., 4s.; 7 lb, 2s. 6d. Sample Tins, 1s. 3d.

Half-cwt. and upwards sent Carriage Paid to any Station in England, Scotland, or Wales.

Circular, containing further details, instructions, and testimonials, free on application.

J. R. PEARSON & SONS,
CHILWELL, NOTTS.

BONES! BONES!! BONES!!! Any size from dust to 1 inch. Dissolved Bone Compound, for Top-dressing. All at 10s. per cwt.; less quantity, 1½d. per lb. Carriage paid on 1 cwt. Terms, Cash with Order. Special quotations for large Buyers.
E. S. WILES AND CO., Bone Crushers, St. Albans.

CONCENTRATED MANURE.

GLOBE FERTILISER.

When using this Fertiliser for Flowers, Fruits, and Vegetables, results are marvellous. Plants grown in the open air are equal in Bloom and Beauty to those grown in hothouses.

Sold by Seedsmen, 1d. and 2d. Packets; 1s. 6d., 2s. 6d., 5s., and 10s. in Bags, or from the Sole Manufacturers, Carriage Paid. Cash with Order.
GLOBE MILL COMPANY, Stratford Market, London, E.

BEESON'S MANURE.

Has now been universally used in all the principal gardens for over twenty years, and has proved the Best and Cheape t Fertiliser for Vines, Plants, Vegetables, and all purposes. With the aid of entirely new machinery, it is now being sent out in splendid condition. Write for Circular containing the leading gardeners and market growers reports. Sold in tins at 1s., 2s. 6d., and 5s. 6d. and 10s. 6d. each; also in 1 cwt. bags, sealed, 13s. each, by all Seedsmen; or apply direct. 1 cwt. and above is sent carriage-paid for cash with order, and special terms for large quantities. Directions for use are placed in each bag, and printed on tins.

Testimonials.

"Shirburn Castle, January 5, 1890.

"SIR—As you requested my opinion of the houses which you erected for me some 4 years ago, I beg to inform you that I consider them a perfect success, and I have recommended them to many of my neighbours.—Yours truly (signed) MACCLESFIELD."

"Hornby Castle, Lancaster, February, 1890.

"Major FOSTER has much pleasure in stating that the vineries and forcing-houses which were erected by Mr. Helliwell in 1884, continue to give perfect satisfaction, both to himself and his gardener."

"Estate Office, Ripley, Yorkshire, January 23, 1890.

"Sir HENRY INGILBY has much pleasure in stating that the glazing work executed by you, under your patented system, at the Ripley Castle Gardens, has been in every respect entirely satisfactory. The work has stood its 8 years' wear and tear extremely well, and has hitherto cost nothing to keep it in repair."

HOLLOWAY'S PILLS.—Impurities of the Blood.—To ensure health it is absolutely necessary that the fluids and solids of the human body should be kept free from those impurities which are continually getting admission into the system by erroneous living, unwholesome atmosphere, or disordered stomach. The only safe and certain way to expel all impurities is to take Holloway's Pills, which have the power of cleansing the blood from all noxious matters, and at the same time removing any irregularities which their presence may have already produced in any organ. Holloway's Pills expel all humours which taint or impoverish the blood, which they purify and invigorate, and give general tone. They are applicable to all alike—young or old, robust or delicate.

BEGONIAS.—Ours are now lovely, and showing more and more every day surprisingly beautiful flowers, and new colours of exquisite tints. Our Seedlings never were so good and robust: we should feel a real pleasure in showing them to friends and coming customers, and also around our establishment, which is now highly interesting. Our Illustrated Catalogue is acknowledged the best Year-Book for the Garden ever issued, and we should like to send it to all who are desirous of having really good Gardens. The best Plants and Seeds, which we send safely to all parts of the world. H. CANNELL AND SONS, Swanley, Kent.

THE NEW FLOWER from SOUTH AFRICA.

NEMESIA STRUMOSA SUTTONI.—Mr. W. H. GOOD, The Gardens, Wonham Manor, Betchworth, says:—"The Nemesia Seed has come well—fully 60 per cent. It was sown on March 13, shaded for a few days, then exposed to the sun. I saw to-day (April 3) several more plants coming up. We lost three plants after be ng watered; it is now kept dryer."

Price of Seed, 2*s.* 6*d.* per packet, post-free. The seed germinates best when sown during the month of May. Nemesia strumosa Suttoni can only be obtained direct from—

SUTTON AND SONS, THE QUEEN'S SEEDSMEN, READING.

B. S. WILLIAMS AND SON'S IMPROVED MUSHROOM SPAWN, for Outdoor and Indoor Culture. Per bushel, 5*s.*; per cake, 6*d.* Per cake, free by Parcel Post, 1*s.* Victoria and Paradise Nurseries, Upper Holloway, London, N.

New Roses.—Princess May and Corinna.

WM. PAUL AND SON are now Booking Orders for the above. Plants, 10*s.* 6*d.* each, are expected to be ready at the end of May. Orders will be executed in rotation as received.
PAULS' NURSERIES, Waltham Cross, Herts.

NEW COLEUS, "DISTINCTION."
INTRODUCED 1892.
To the Trade, 9s. per dozen, in Small Pots.

This is undoubtedly the finest introduction in the way of Coleus yet announced, and will prove a most valuable acquisition for Bedding or Decorative Purposes, the foliage being of a striking reddish rich maroon, and darker in colour than any other variety; it is also of a very sturdy growth, and hardy character.
Award of Merit from the Royal Horticultural Society, August 22, 1892.
J. A. MORRIS, Nurseryman, Church Road, Acton, W.

B. S. WILLIAMS & SON

FLORISTS' FLOWERS, a Specialty.—My Superb Collections of Antirrhinums, Auriculas, Begonias, Carnations, Dahlias, Delphiniums, Fuchsias, Gaillardias, Pæonies, Pansies, Pelargoniums, Pentstemons, Petunias, Phloxes, Pinks, Potentillas, Pyrethrums, Violas, Hardy Border and Herbaceous Plants, &c., are the grandest ever brought together. They have been awarded numerous Certificates and Gold, Silver, and Bronze Medals, by the leading Horticultural Societies in the kingdom, with emphatic eulogiums by the Press, and my Illustrated Catalogue of them for 1893, 134 pages, which should be carefully perused by all before ordering elsewhere, is the largest, most comprehensive, and most reliable ever issued on Florists' Flowers and Hardy Plants. It has been posted to my Patrons, who will please oblige by informing me if any have miscarried, when I shall be happy to post another copy, free on application.
JOHN FORBES, Hawick, Scotland.

MESSRS. LINDEN, "L'HORTICULTURE INTERNATIONALE,"

HAVE TO OFFER SOME FINE PLANTS OF

DRACÆNA SANDERIANA.

DRACÆNA SANDERIANA (more exactly DRACÆNA THALIOIDES, mar. var. fol. variegatis, Braun), was discovered in 1888, by Mr. Braun, in the Cameroon (Africa), and sent to the Imperial Botanic Garden of Berlin, and *the same was sold last year by a Nurseryman of that city.*

We have also purchased our stock at Berlin, and we are exhibiting now fine plants in the Show-houses of L'HORTICULTURE INTERNATIONALE, at Brussels, and intend to place the same before the Floral Committee of the Royal Horticu'tural Society, at the Drill Hall, on May 9 next.

Price on application. Apply to—

MESSRS. LINDEN, L'Horticulture Internationale, BRUSSELS.

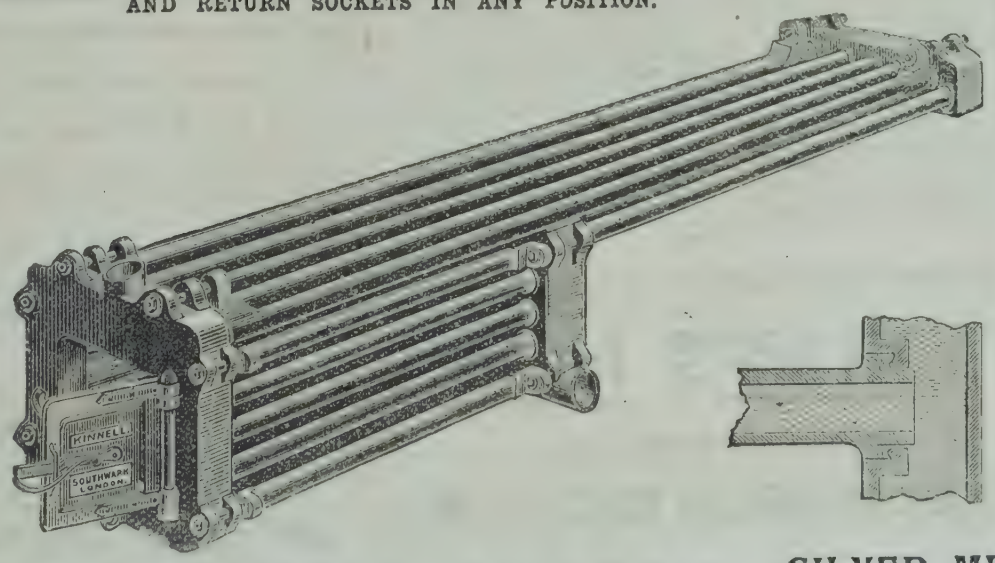
CHARLES P. KINNELL & CO.,

IRONFOUNDERS, ENGINEERS, and BOILER-MAKERS.

ROCHFORD HORIZONTAL TUBULAR BOILER,

BOLTING TOGETHER WITH INDIA-RUBBER RING-JOINT, MANUFACTURED WITH FLOW AND RETURN SOCKETS IN ANY POSITION.

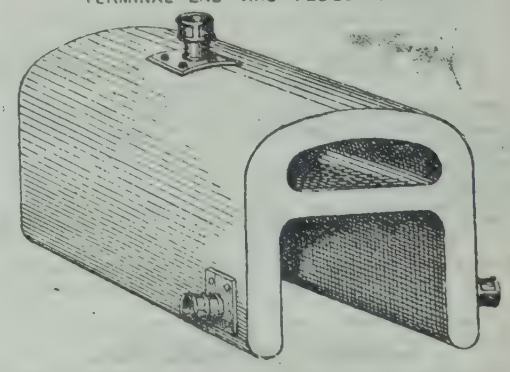
This Boiler has special advantages over any other of this type manufactured; the configuration of the centre casting divides the top connecting-pipe into 2 sections, gives increased water-way, and is removeable without taking off back casting. No other Boiler has this advantage.



TERMINAL END AND CHAMBERED SADDLE BOILER.

Very Highly Recommended.

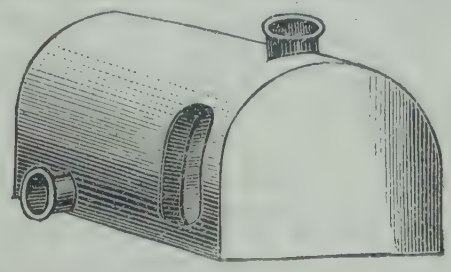
TERMINAL END AND FLUED SADDLE.



This Boiler is of the IMPROVED SADDLE FORM, is manufactured in Wrought Iron, welded; the back water-way, against which full force of the fire strikes, and the centre flue, make this **one of the most economical Boilers extant.** *Made in all sizes, from 24 to 72 inches long.*

CAST-IRON SADDLE BOILER,

WITH WATER-WAY END AND CENTRE-FLUE

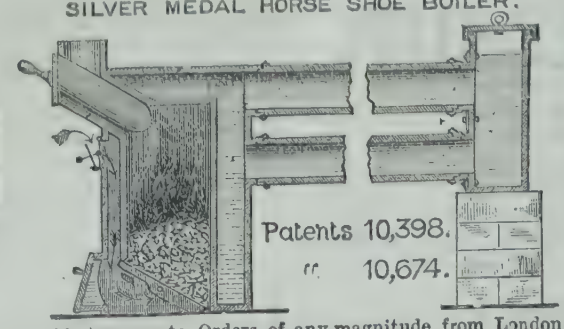


The above is the best of all Boilers of the plain Saddle type. Made in all sizes, from 24 to 66 inches long.

SILVER MEDAL HORSE-SHOE BOILER,

THE BEST AND MOST ECONOMICAL AMATEURS' BOILER MANUFACTURED

SILVER MEDAL HORSE SHOE BOILER.



Section of Boiler and Pipes, showing action of Hot Blast and Automatic Regulator. Awarded the **SILVER MEDAL (FIRST PRIZE)** by the Royal Horticultural Society in 1883; still stands without rival for

Power, Efficiency, and Economy.

Holding one of the largest stocks of H. W. Boilers, Pipes, and Fittings, in the Kingdom, we are able to execute Orders of any magnitude from London Warehouses, or to despatch direct from Works without delay. To meet the requirements of our increasing business, we have recently added **No. 65, SOUTHWARK STREET,** to our London premises, and have now the largest and finest Show-rooms in our Trade in the Kingdom. *Price List Illustrating all types of Boilers, Valves, Pipes, Ventilating Gear, and all classes of Horticultural Appliances free on application.*

65 and 65a, SOUTHWARK STREET, LONDON, S.E.; also Branches at GUERNSEY and JERSEY, for CHANNEL ISLANDS.

BEAUTIFUL LILIES in POTS.—All the most beautiful Lilies for Greenhouse or Outdoor Decoration. Full Descriptive LIST free on application.
BARR AND SON, 12, King Street, Covent Garden, W.C.

BEAUTIFUL NEW PHLOXES, DELPHINIUMS, PENTSTEMONS, and PYRETHRUMS now ready for planting. Full Descriptive LISTS free on application.
BARR AND SON, 12, King Street, Covent Garden, W.C.

To the Trade.
MANGEL WURZEL and TURNIP SEED.

Post-free 3½d.; 25 Copies, 5s.; 50, 10s.; and 100, 20s.

Parcels of not less than twenty-five delivered, Carriage Free, in *London* only.
Not less than one hundred Carriage Paid to any part of Great Britain.

GARDENERS' CHRONICLE OFFICE, 41, WELLINGTON STREET, STRAND, W.C.

DIXONS' SUPERB GIANT CINERARIA.

THE CHOICEST STRAIN IN THE COUNTRY.

In Sealed Packets, 1s. 6d., 2s. 6d., and 5s. each, post-free.

The following Testimonials are taken from a large number received:—

TESTIMONIALS.

From Mr. F. MOLYNEUX, The Gardens, Swanmore Park:—
"I consider your strain of Giant Cineraria really superb; the blooms produced were the largest I have yet seen, some measuring 3¾ inches in diameter, and possessing much substance, while the habit of growth was all that could be desired."

From Mr. F. BOLLAM, The Gardens, Axwell Park:—
"Your superb Giant Cineraria is now coming into bloom; I consider it a first-class strain of a very careful selection; habit of plants sturdy, the flowers very large, and well-formed."

From Mr. G. CLIFFE, The Gardens, Shoreham Place:—
"I have much pleasure in testifying to the value of your Giant Cineraria; they grow very vigorous, and the blooms are the finest I have ever seen."

From Mr. W. BENNETT, The Gardens, Rangemore Park:—
"The Cinerarias turned out very well; plants fine and sturdy; flowers large, compact, of good substance, and varied in colour."

From Mr. J. RIDDELL, The Gardens, Castle Howard:—
"The plants obtained from the Cineraria Seed you sent me last April have been unusually fine, producing immense heads of bloom. The individual flowers were large in size, of good substance, and various colours. Your strain is the finest I have yet seen, and I predict its vigorous health and abundance of bloom will commend it to all who make a specialty of this plant."

From Mr. W. HARMAN, The Gardens, Newnham Paddox:—
"Your superb Giant Cineraria Seeds you sent me last April were simply splendid; I never saw a finer strain. The plants grow vigorous, of rather dwarf-branching habit. The flowers are large, and of great substance, with the most beautiful shades of colour, some of them measured 3 inches in diameter, grown in 6-inch pots. I have no doubt when your strain is better known, there will be a great demand for it."

REPRODUCED FROM A PHOTOGRAPH.

TESTIMONIALS.

From Mr. G. MUSK, The Gardens, Haverland Hall:—
"Your superb Giant Cinerarias were greatly admired the habit and colours were all that could be desired."

From Mr. W. COLEMAN, The Gardens, Eastnor Castle:—
"I have pleasure in testifying to the splendid quality of your Giant Cinerarias. They are in flower at the present time, and, considering the small size of the pot, they would be hard to beat. The flowers are of splendid size and substance, and the colours first-class; in fact, there is not one poor flower out of about fifty plants."

From Mr. J. EASTER, The Gardens, Nostell Priory:—
"Your strain of Cineraria is of great excellence; plants strong and branching, many of which have a fine pyramidal habit, with extra large well-shaped flowers. The selfs are the finest I ever saw. I am preserving a white, also a blue self, for propagation."

From Mr. J. HUGHES, The Gardens, Wentworth Woodhouse:—
"Your strain of Cineraria is a good one. The plants are very compact, blooms large, colours bright, and the markings well defined."

From Mr. J. SMITH, The Gardens, Mentmore:—
"The Cinerarias we raised from the seed you sent last year have all turned out very large, the flowers of great substance, and good colours."

From Mr. J. CORBETT, The Gardens, Mulgrave Castle:—
"Your Giant Cineraria is all that can be desired; it is a valuable strain; the flowers are very large and splendid in colour, of all the finest shades; the blues are undoubtedly the best I have met with."

From Mr. G. WYTHES, The Gardens, Syon House:—
"The Giant Cineraria Seed sent me turned out some fine plants, of good habit, large blooms, and beautiful colours; it is a fine strain, and a decided acquisition."

From Mr. J. W. LEE, The Gardens, Clifton Castle:—
"Your Giant Cineraria is a first-class strain, of a dwarf sturdy habit; flowers large size, good colour and substance."

PRICE TO THE TRADE ON APPLICATION.

E. P. DIXON & SONS,

The Yorkshire Seed Establishment, HULL.

FRIDAY, MAY 19, 1893.

GREAT ORCHID SALE,

FRIDAY, MAY 19, at MESSRS.

PROTHEROE & MORRIS',

67 and 68, CHEAPSIDE, LONDON.

A splendid importation of the true old

CATTLEYA LABIATA,

IN FINE ORDER.

A fine importation of our famous type of

DENDROBIUM NOBILE,

From the Lang-tang Mountains.

RICH IN PURE WHITE AND DELICATE FORMS.

The lovely D. n. Ballianum and D. n. Amesianum, and other beautiful forms, came from the same district.

A fine importation of the unrivalled

CYPRIPEDIUM INSIGNE MONTANUM,

From the district that produced C. i. Sanderæ Sanderianum, and all the superb forms that have appeared for several seasons past.

DENDROBIUM FINDLEYANUM, many extra fine masses, in very fine condition.

A splendid lot of the new and free-flowering

GRAMMATOPHYLLUM MICHOLITZIANUM.

CALANTHE SPECIES from Cambodia,

Twenty Plants of the charming Habenaria carnea,

And many other valuable Orchids.

SANDER & CO., ST. ALBANS.

Gardeners' Chronicle.

SATURDAY, APRIL 29, 1893.

LIFE IN THE SOIL.

WE now know three things at least about the soil we cultivate, viz., that it is of mineral origin, formed primarily of rock-dust, and so inorganic. Then it has added to it from time to time the organic matter afforded by the decomposition of plants and animals, such as dead and decaying vegetation, and the various animal manures. But thirdly, and in this case lastly, there is actually life in the soil, microscopic it is true, but vegetable life, active and potential, as all life is anywhere and everywhere, for where there is life there is no absolute rest, something is ever and always being done. In a word, vegetable life as we know it to-day is ever and always potential, and it is always operating on and altering the chemistry of other matter around it either living or dead. This much is especially true of the living vegetable organisms which are found more or less abundantly in all soils.

These soil-organisms are really minute members of the fungus family, very low organisms it may be from a biological standpoint, even although it is part of a biologist's faith to call nothing, however low or minute, in the scale of life, "common or unclean;" and so even the low fungoid forms of life, now so familiar under the general name of bacteria, deserve the gardener's attention, seeing that they work for him unceasingly, even if, like the work of the good fairies of old, their operations be unseen.

Bacteria are then simply extremely minute representatives of the Mushroom and Toadstool family of plants, full of energetic potentialities for evil or for good, as the case may be, just as the higher fungi may either feed us or poison us, according to natural laws, not as yet well "understanded of the people."

Someone once said to an American humorist, I think it was Mark Twain, "Yes! you see the botanists are very clever people, but they, even can't say, how we should distinguish Mushrooms from Toadstools." "Oh! that is easy enough," said the humorist, "you should eat the darned things right away; then if you live, it's a Mushroom, and if you die, it's a Toadstool!"

This is a strong appeal in favour of actual experience, as opposed to mere theory, and as a fact we know and learn much more of the bacteria by experience, i.e., by the results of their labours than we at present can do of the organisms themselves, and so the working results of soil bacteria are evident, for it is their office to reduce the organic matter deposited in the soil to the elements of the rock dust, and of the atmospheric carbon and nitrogen whence it was originally derived.

Now, bacteria generally agree, so far, with

*

the great fungus family of plants, that the activity of some is malignant, and that of others, is benevolent and life-giving. Bacteria, in a work, may be bacteria, but they are divisable into two distinct sections or groups. There is, in fact, a notable difference between the "bad fairies—the imps of darkness," that cause pathological disorders, such as anthrax, typhoid fever, and small-pox, or hydrophobia and tetanus—and the "good little people," that really act as the benevolent scavengers of Nature, and diffuse new life, and health, and beauty all around them, in garden and field; and to the latter group or division belong the soil-organisms, to which we desire to draw the especial attention of all interested in soil or earth-culture to-day. The bacteria of cultivated soils belong to the micrococci, rounded or egg-shaped bodies, not unlike frog-spawn when highly magnified, which carry on great chemical changes in the soil. There are presumably different species of bacteria that do this, some of which are spoken of as the "nitrous" and others as "nitric" organisms of the soil, and each organism has its own special work or function to fulfil.

The general work of both these organisms is to carry out or to cause what is called "nitrification" in the soil, a process of oxidation or decomposition by which organic and inorganic matter is rendered soluble or immediately available for growing crops. You can sow or plant a crop in the soil, but that does not mean that soil-food is at once fit to be taken up in watery solutions by the rootlets of the crop. Planting or sowing the land is, in fact, analogous to taking a horse to the water—you can "take him there, but you can't make him drink." So you can plant your fruit trees, or sow your vegetable seeds in the earth, but unless the soil organisms have rendered the plant-food soluble, i.e., unless it has become "nitrified," the plants will not, because they cannot, take it up and send it to their leaves for further development, and thence to be returned or attracted to flowers, fruits, or stems, for man's service and delight. We have said that there are two groups of bacteria that act in the nitrifying process continually going on in the soil, and from the latest evidence it appears that the function of the "nitrous" organism is to attack the ammonia in the soil, and form from it what are called nitrites, and after the ammonia (nitrogen) is thus changed, the "nitric" organism begins its work upon the nitrite, and reduces their composition into nitrates, i.e., nitrogen in a soluble state available for the rootlets of living vegetation. Thus we here see a most beneficent kind of "symbiosis," a potent co-operation ever going on between the higher and the lower races in the vegetable world; and after this, need we wonder at the folk-lore which tells us of the "good fairies" that carried on the farmwork at night unseen and unheard? That bacteria did this in all the farmhouse operations of brewing and baking, and cheese-making, as well as on the farm itself, is a well-known fact to-day, and one with which we cannot become too familiar in the garden.

It may interest some readers to know that microscopic slides of the "nitrous" organism or bacterium, prepared by Prof. Winogradsky, can be obtained of Messrs. Newton & Co., of 3, Fleet Street, E.C., and those who would like to dive deeper into this fascinating question of life in the soil may consult with advantage the following papers, &c.:—

Winogradsky, in the *Annales de l'Institut Pasteur*, 1890.

Munro, in the *Journal of the Royal Agricultural Society of England*, December, 1892.

Frankland (at Royal Institution) in *Nature*, June 9, 1892.

Warington, R., letter in *Nature*, vol. xliv., p. 190, on "Nitrification in the Soil."

Those interested in economic bacteriology severally might with advantage refer to—

"Recent Contributions to the Chemistry and Bacteriology of the Fermentation Industries," *Cantor Lectures*, 1892, Society of Arts, London (price 1*s.*); or, *Our Secret Friends and Foes*, S.P.C.K., 1893, price 2*s.* 6*d.*

In conclusion, I should like to say that the whole subject of soil-organism, as also of bacteria generally, is well worthy of the gardener's closest attention, seeing that these organisms seem to lie at the very base of all growth-force, as well as at the root of most, even if not of all, kinds of decomposition as it occurs in the garden.

In a future paper, I should like to draw further attention to the bacteria peculiar to Leguminose vegetables, and which are supposed to possess the unique power of "fixing" free atmospheric nitrogen. *F. W. Burbidge.*

New or Noteworthy Plants.

Galanthus Ikariæ, *Baker, n. sp.**

This new Snowdrop has been discovered in the island of Nikaria (the classical Icaria), which lies a short distance to the south-west of Samos off the west coast of Asia Minor, by the collectors sent out by Mr. Whittall, of Smyrna. My attention was first drawn to it by Mr. James Allen, of Shepton Mallet, who sent me a leaf in February, and told me that he felt confident it would prove to be a new and distinct species. Now we have received a couple of half-dried specimens in flower from Mr. Whittall, and I find that Mr. Allen's prediction is fulfilled. It has the bright green broad leaves of G. Fosteri, the quadrate lobes of the inner segments of the perianth with crisped edges of G. Elwesii, and the single apical blotch upon the inner segments of G. nivalis. Mr. Allen compares the leaves to those of a Leucojum.

Bulb not seen; sheath 2 inches long, truncate at the apex; leaves lorate, rather shorter than the scape, projecting from it 4 to 5 inches at the flowering time, bright glossy green, ½ to ¾ inch broad, the margin not at all recurved; scape 7 to 8 inches long; bracts linear, with reflexed edges, 1½ inch long; pedicel shorter than the bract; ovary oblong, ⅓ inch long; outer segments of the perianth oblong-spatulate, nearly an inch long; inner cuneate, half as long, emarginate, with square apical lobes crisped at the edge, and with a tendency to recurve at the tip, the single apical green blotch occupying half of the outside of the segments; stamens rather shorter than the inner segments; anthers orange-yellow, minutely mucronate. *J. G. Baker.*

Iris (Oncocyclus) Bismarckiana, *Regel in Hort. Dammann; Baker, Handb. Irid, p.* 18 †

This fine new species of Oncocyclus was introduced a year or two ago from the Lebanon country by Messrs. Dammann. It is briefly noticed in my handbook, but has never been properly described, and I have never seen a specimen before the one which Mr. Sprenger has now kindly forwarded, from which my description is taken. The leaves are much broader than those of any other Oncocyclus. The outer segments of the perianth are dark brown, with a yellow-green groundwork showing towards the edge; the inner segments are very pale, so that there is a great contrast in colour between the two rows. Its alliance is with I. Sari, *Botanical Magazine*, t. 6960. I am sorry that I. atro-purpurea was accidentally omitted from my handbook.

Leaves 6 to 7, in a basal rosette much curved, pale green, broadly ensiform, 6 to 8 inches long, an inch broad; peduncle stiffly erect, one-headed, not longer than the leaves; spathe valves 3 inches long, oblong, acute, permanently imbricated, pale green, tinged with brown towards the tip, not at all scariose at the flowering time; pedicel very short; ovary above ½ inch long; perianth-tube green, cylindrical, under an inch long; outer segments obovate-cuneate, reflexing, 2½ inches long, nearly 2 inches broad, plain dark brown in the middle, thickly veined with dark brown on a yellowish-green groundwork all round, with a velvety cushion down the claw, of which the hairs of the lower part are mainly all yellow; inner segments obovate-unguiculate, 3 inches long, 2 inches broad, veined with dark lilac, and towards the base with brown on a pale lilac ground; style-branches 1½ inch long, very convex on the back, and sharply keeled, with large reflexing quadrate apical crests; anther white, twice as long as the filament. *J. G. Baker.*

Scilla (Prospero) leucophylla, *Baker, n. sp.**

This is a very distinct new Scilla, which has been imported by Leichtlin from the mountains of western Persia. It much resembles in aspect some of the Hyacinths of the sub-genus Bellevallia, but the segments in flower are free down to the base. It is dwarf in habit, with small intensely glaucous leaves and bright purple flowers tipped with green. It flowers in April.

Bulb small, globose; leaves four, clasping the base of the stem, erect, 4 to 5 inches long, under an inch broad, rather thick and firm in texture, with obscurely ciliated edges; peduncle green, rather longer than the leaves; raceme oblong, 1½ to 2 inches long; pedicels shorter than the flowers, the upper ascending, the lower cernuous, with a pair of minute white bracts at the base; perianth permanently oblong, ⅓ inch long, bright blue-purple, with a green tip; filaments linear, as long as the perianth; anthers small, dark blue-purple; ovary small, ovoid; ovules two in a cell, basal; style reaching to the tip of the segments.

Fritillaria (Monocodon) Whittallii, *Baker, n. sp.*†

This new Fritillary is wonderfully like our familiar English F. Meleagris in habit, leaf, and flower; but it has an orbicular instead of a linear nectary, in which respect it resembles F. lusitanica and F. messanensis. F. Meleagris is not known with certainty in any part of the region covered by Boissier's *Flora Orientalis*. Its nearest oriental allies previously known, such as F. acmopetala and F. lycia, have non-tesselated or very obscurely-tesselated flowers. The present plant has, I believe, been widely distributed by Mr. Whittall, of Smyrna, by whose collectors it was obtained from the western end of the great Taurus range. My description is drawn up from living plants raised at Kew, from bulbs which he sent us a year ago. It flowers in

* *Galanthus Ikariæ*, Baker, n. sp.—Foliis scapo brevioribus loratis nitide viridibus marginibus haud recurvatis; scapo 6-8 pollicari; perianthii segmentis exterioribus oblongo-spathulatis, segmentis interioribus apice emarginatis lobis quadratis crispatis maculâ viridi unico apicali magno; antheris minute mucronatis.

† *Iris* (*Oncocyclus*) *Bismarckiana*, Regel in Hort. Dammann; Baker, Handb. Irid., p. 18.—Foliis productis 6-7 falcatis ensiformibus pallide viridibus; caule brevi monocephalo; spathæ valvis oblongis magnis sursum fusco tinctis; pedunculo brevi; perianthii tubo brevi; segmentis exterioribus obovato-cuneatis fusci prope marginem viridi flavo decoratis, interioribus obovato-unguiculatis pallide lilacinis venis saturatoribus; styli ramis arcuatis appendicibus magnis recurvatis.

* *Scilla* (*Prospero*) *leucophylla* Baker, n. sp.—Bulbo parvo globoso; foliis 4 erectis lanceolatis intense glaucescentibus margine obscure ciliatis; scapo foliis paulo longiori; racemo multifloro oblongo; pedicellis flore brevioribus; bracteis minutis geminatis; perianthio oblongo purpureo apice viridulo, segmentis lineari-oblongis diu conniventibus; staminibus perianthio æquilongis; stylo elongato; ovulis geminis basalibus.

† *Fritillaria* (*Monocodon*) *Whittallii*, Baker, n. sp.—Bulbo parvo globoso; caulibus gracilibus; erectis monocephalis elongatis; foliis 6—7, linearibus alternis dissitis facie canaliculatis; flore cernuo, perianthio late campanulato basi truncato utrinque viridulo distincte tesselato, segmentis oblongis diu imbricatis, nectario orbiculari; stylo sursum trifurcato.

England at the end of March. We have had incomplete specimens in the herbarium for a couple of years, placed amongst the "doubtfuls."

Bulb small, globose. Stem reaching a length of 1 foot, slender, one-flowered. Leaves six or seven, alternate, distant, ascending, linear, 4 to 6 inches long, channelled down the glaucous face. Perianth broadly campanulate, drooping, truncate at the base, 1½ inch long, tesselated inside and out with brown spots on a green ground; segments oblong, permanently imbricated, ½ to ⅝ inch broad; nectary large, green, globose, placed a little above their base. Stamens more than half as long as the perianth anthers linear, white, ¼ inch long. Style deeply trifid. *J. G. Baker.*

¼ inch broad at the throat, bright yellow at the top. Perianth-segments oblong, spreading, lemon-yellow, ¾ inch long. Corona obconic, orange-yellow, ½ inch long and broad, with an erect minutely crenate margin.

6. Tazetta parent type.—Leaf ¾ inch broad. Scape stout. Umbel of three to five erect flowers, two with pedicels fused nearly to the top; pedicels 1½ to 2 inches long. Tube narrowly funnel-shaped, ¾ inch long, ¼ inch diam. at the throat. Segments oblong, spreading, pale sulphur-yellow, ¾ inch long, Corona funnel-shaped, bright yellow, ½ inch long, ½ to ⅝ inch diameter at the throat, with a truncate erect edge.

7. Tazetta parent Grand Monarque.—Leaf ¾ inch broad. Umbel of two inclined flowers; pedicels 2 inches long. Tube narrowly funnel-shaped, whitish at the top, ¾ inch long, ¼ inch diameter at the throat. Segments oblong, pale sulphur-yellow, an inch long, ½ to ⅝ inch broad; corona lemon-yellow, funnel-shaped, ¾ inch long, ⅝ inch diameter at the throat, with an erect truncate edge.

8. Psyche, Tazetta parent papyraceus.—Leaf ⅓ inch broad. Scape slender. Umbel of two erect flowers with short pedicels. Tube narrowly funnel-shaped, white at the top, ¾ inch long, ¼ inch diameter at the throat. Segments white, lanceolate, ½ to ¾ inch long. Corona white, ¼ inch long and broad.

No. 4 and 5 come in between typical Pseudo-Narcissus, but have three flowers; 6 and 7 approach Macleaii and Sabini; and 8 is like Margaritæ, closely allied to papyraceus. *J. G. Baker.*

Fig. 74.—Erythea edulis.

(A little-known Palm from the Island of Guadalupe, South California.)

Dammann's Hybrids between Narcissus Pseudo-Narcissus and Tazetta.

The following are additional hybrid forms to those already described, obtained by Mr. Sprenger by crossing forms of the Daffodil with Narcissus Tazetta.

4. Tazetta parent aureus. Leaf ¾ inch broad. Scape stout. Umbel of three inclined flowers; spathe 2 inches long; pedicels rather shorter. Tube narrowly funnel-shaped, ¾ inch long, ⅓ inch broad at the throat, bright yellow at the top, green lower down. Perianth-segments ovate-lanceolate, ascending, lemon-yellow, 1 inch long. Corona obconic, orange-yellow, ¾ to ⅞ inch long and broad, with an erect, deeply six-lobed margin.

5. Leaf 1 inch broad. Umbel of three inclined flowers; spathe 2 inches long; pedicels 2 to 2½ inches long. Tube narrowly funnel-shaped, ¾ inch long,

Erythea edulis at Home.

A lonely and gloomy-looking home it appears that island of Guadalupe, as it emerges abruptly from the ocean, with no distant land in sight, at 250 miles south of S. Diego, its vertical cliffs rising some thousand feet high, variously striped with the strange colours of the volcanic rock; apparently inaccessible and destitute of vegetation beyond a scanty crown of Pines on the very ridge of the northern cliffs.

It was in February, 1876, that S. Watson published in the *Proceedings of the American Academy of Arts and Sciences*, vol. xi., the list of plants collected in Guadalupe Island during the spring of the previous year, by Dr. Ed. Palmer, who was the first naturalist to visit this most remote Californian land, and there these few words refer to Erythea edulis.*

"Frequent in deep warm ravines from the northern end to Jack Bay, the only thing on the island having a tropical look. It attains a height of about 40 feet, averaging 15 inches in diameter. Each tree bears one to four clusters of fruit, 4 feet in length, and each weighing 40 or 50 lb. The fruit is eaten by man, goats, birds, and mice. In flower near the end of March."

In the spring of 1885, the island was visited again by Rev. E. L. Greene, of the University of California, and an account of his stay of one week there, and of the plants collected, appeared in the *Bulletin of the California Academy of Sciences*, January, 1886, where this brief mention is made of the Palm:—"There flourishes in the cañons a tall and handsome Palm, which bears an edible fruit, and is the sole produce of the island that looks tropical." The number of November 14, 1885, of the *Gardeners' Chronicle* contains a most interesting notice on the peculiar features of vegetation on Guadalupe, by Mr. W. B. Hemsley, which, however, adds no more information on this subject, as no other source was available to him besides the two above quoted papers.

This is all that was known up to now about a species of Palm offering such peculiar interest, not only to the botanist, for its so narrow limited habitat, and for its affinities to the Australian Livistonas more than to the Mexican Braheas, but also in the eyes of horticulturists, who are sure to find it to be the most elegant of all Fan Palms from the Northern American continent—a fast grower, quite suitable for conservatories in the North, and for the open air in the South of Europe, where a prominent place it is likely to attain also in regard of its fruits, which are similar in size and taste to Prunes.

Since 1875, small quantities of seed have found their way to Europe, but their high price, and the very long time they take to germinate, if not quite fresh, and, chiefly, the nearly total ignorance of the merits of this Palm, have prevented its more general diffusion, and it is affirmed that no large specimens are to be seen in European gardens, while on the mainland of California their number will hardly exceed one dozen.

The remarkable elegance and beauty of the adult specimens seen here, and the wish to unravel the veil that still covered this mysterious representativ

* The slender trunk sometimes 30 feet high (many of 40 fe have been measured), and 15 or more inches in diamet covered with a thick corky cracked bark; the fibrous sheat ing bases of the leaves at length glabrous; petioles stout, ov an inch broad at the summit, plano-convex with acute unarm margins (small rudimentary spines are rather frequent), som what pubescent or glabrate above; ligule 2 or 3 inches lon very densely silky tomentose; blade 3 feet long (often 4 and 5 the (seventy or eighty) folds at first tomentose, cleft to t middle (less deeply on the underside), lacerate at the ape and somewhat fibrous on the edges; panicle 4 feet long (gen rally between 5 and 6), much branched, densely tomento becoming glabrate; flowers numerous in clusters of three four, the corolla (one and a half lines long) twice longer th the calyx; segments of the corolla lanceolate, carpels glabro fruit over an inch in diameter (falling down when ripe), t thick pulp sweet and edible, seeds 7 to 9 lines in diamet slightly flattened on the inner side, with smooth and gray thin, but very hard and bony epidermis; embryo near the b on the dorsal side. Each tree bears one or four panicl blossoming late in March (as early as December and Januar The fruit clusters are said to weigh 40 to 50 lb. *S. Wats in Botany of California, vol. ii., p.* 212. [The words in par theses are added by the present writer.]

of a tropical flora on a land comparatively cold for the latitude it lies in, were enough to induce me to encounter the difficulties of sailing to, and staying on that desert island, long enough to be able to gather full information about E. edulis, which I am now happy to put under the eyes of all persons interested in horticulture, through the columns of the *Gardeners' Chronicle*.

The Island of Guadalupe, lying by 29° lat. N., has an oval shape, hardly broken by unimportant inlets, and is about 19 miles long from north to south, with an average breadth of 6 to 7 miles. The highest peak—Mount Augusta—having an elevation of 4500 feet, only a few hundred feet on the level of the upper plateau, near the centre of the island. It is not exactly a tableland, as it has been described, but presents different plateaus and well-defined circular segments, undoubtedly the result of the now wholly subsided activity of two distinct volcanic centres, of which the principal one has formed the northern part, and shows still more than half the circus of the primitive crater—not less than 4 miles in diameter—while the more eastern portion has been destroyed by the ocean in some posterior convulsion.

The distribution of the Palms appears to have been always restricted to this northern part, probably on account of the excessive aridity of the southern, which is utterly devoid of springs, and is not refreshed by the fogs that are so often brought over the northern by the cool north-western winds prevailing in this region nearly all the year round.

In altitude the Palms occupy rather a narrow zone, ranging from 300 to not above 1500 feet. What appear to be the scattered remains of a formerly considerable grove (such, perhaps, when Dr. Palmer first visited the island) are to be seen on the eastern side, right and left, of the cañon that drains the southern portion of the old crater, and there the Palms must have been thriving when the ground was all covered with a thick underwood of shrubs, mostly Junipers and Ceanothus. If one can judge from the dead stumps there, like everywhere else over the island, the work of destruction has gone on, and the few Palms, only survivors of the arborescent vegetation, show quite a miserable appearance, sadly breaking the monotony of the brownish lava field. In a few more cañons there used to grow Palms, namely in the cañon coming down to the landing, where man has destroyed them all, for thatching the cabins with their leaves, and eating the central Cabbage, which is indeed delicate and sweet. At present the principal and, one must say, the only considerable grove of Palms exists on the north-west, on a steep slope facing the sea, cut by a few deep ravines, and covers an area of 1½ to 2 miles in length, by ½ to 1 mile in breadth. It was indeed splendid and repaying, after many miles of climbing up and down among rocks, to come in sight of this beautiful forest of Palms, waving their gracefully bent light green leaves to the breeze from the underlying deep blue ocean, a striking contrast being made also by some huge dark Pines—P. insignis var. binata, Eng., growing amongst the Palms, not only for the marked difference in colour and appearance, but for our minds being used to symbolise with Pines a cold northern region, with Palms a sunny tropical one.

In former years this grove must have been much more extended towards the north. Very large fires have evidently occurred more than once, fed chiefly by the intermingled Pines, of which a few charred stumps and limbs are yet to be seen, while the burnt up Palms stand erect and unaltered for years. Towards the south end of the Palm grove are still a good number of Oaks—Q. tomentella, Eng. A fine pyramidal tree with very large evergreen leaves covered with white tomentum beneath. This association of Fan Palms, Pines, and Evergreen Oaks is, I think, a feature of some mountains in Mexico.

No undergrowth of young Palms or of any kind of shrub is to be seen under the grove; goats, of which there is an immense number over the island, have a preference for this particular spot, where a luxuriant carpet of grass is growing all the year round. A pretty light blue Nemophila was in flower there early in December—as a deep stratum of rich humus has been forming for years and years among the lava rocks, which protrude their blunt heads everywhere. No better conditions of soil and climate could be desired for the reproduction of the species, favoured by the enormous quantity of fruits produced, but not a single seed escapes the voracity of the goats, which are able to break and digest the kernels, hard as they are. A peculiar characteristic of E. edulis is, that the trunk is quite slender in comparison to its height, and often is slightly bent at the base, so that it has nothing of the heavy massiveness of Washingtonia filifera, and of most of the Sabals. The leaves do not stand stiff and rigid as in other species of the temperate region, but droop gracefully, owing to the length and flexibility of the petioles. What adds much to the elegance of the plant is, that the old leaves, when dead, do not remain to disfigure the upper part of the trunk, but fall down by themselves. The flower stalks reach fully 6 feet in length, and they must be grand indeed, those huge bunches of fruits, quite black when ripe, weighing forty and fifty pounds each! In the island the blooming season is December and January, and the fruits are ripe already in April, a speedy and rather unusual process, if compared with other species of Palms; but the few adult specimens grown in gardens on the mainland appear to be in flower and fruit all the year round, so that the same is likely to occur in the gardens of southern Europe. In such case, however, the panicles are likely to be reduced in size. Special mention must be made of the curious appearance imparted to the trunks of the Palms by the growth of an Usnea (?), which coats them with a sea-green sort of beard, but only on the side facing the ocean.

Young plants of E. edulis, as grown in pots, appear to possess much more gracefulness and decorative value than other Fan Palms; they are for sure to be preferred to Washingtonia filifera as a useful and profitable plant, besides the fruit so abundantly produced. The fibrous expanse of the petioles, when the leaves die off, falls down in a sort of soft thickly-woven mat—a splendid material for packing plants, and to be utilised, perhaps, for other industrial purposes.

About the growth of E. edulis, I must say that fresh seeds germinate in a few weeks, older ones take several months; and after, the plant grows nearly as quickly as W. filifera or Phœnix canariensis, two well-known fast growers.

About the degree of hardiness of this species, judging from the location where it is growing, one ought to believe that it cannot be less than that of W. filifera and of its sister on the mainland, Erythea armata, both well known in European gardens; and it is to be hoped that some information on the subject will be contributed from the gardens of Southern France and of the Riviera. I can only add that a fine fruiting specimen of Erythea edulis is to be seen in the grounds of the University of California, at Berkeley, where occasional frosts are not rare.

How this particular species has been stranded on this limited, lonely island, is a problem that other more competent people will attempt to solve. I have only to say that, since 1875 some botanical explorations have been made on the Peninsula of Lower California and on the adjacent islands, and, while there have been collected some of the plants believed at first to be peculiar to Guadalupe Island, nothing has been seen of E. edulis. Sealers and smugglers, who are well acquainted with every nook of the Lower Californian coast, assure us that no Palm whatever is to be found there. Erythea armata has been collected by Mr. T. S. Brandegee as far south as 29° N. lat.; but inland, ranging north till to about 40 miles from the boundary-line of the United States. Of the home of Erythea armata I hope to be able to afford information another time to the readers of the *Gardeners' Chronicle*. *Dr. F. Franceschi, Los Angeles.*

Orchid Notes and Gleanings.

A FINE PLANT OF DENDROBIUM NOBILE.

The pseudobulb of Dendrobium nobile which is sent with this note was taken from a plant of twenty growths growing in a basket, all being equally as good as this one. It was bought three years ago as a small newly-imported piece of Dendrobium Wardianum Lowii. It may, perhaps, interest some of the readers of the *Gardeners' Chronicle* to be made acquainted with the kind of culture pursued, and which affords such good results. I know that many gardeners advise the cutting down of the old pseudobulbs; but this practice I strongly object to, and I never prune or cut away any of the pseudobulbs before they are at least three years old—in fact, not before they are quite dried up. Some people may say this gives the plant an untidy appearance; but I find that with good strong plants the old growths are not noticed, and even should they be, my advice is to study the health of the plant before its appearance, and to ask yourself, is such pruning natural?

In potting, good brown fibrous peat, charcoal, and crocks are made use of, the crocks, pots, or baskets being made thoroughly clean. The peat is broken into pieces of the size of a Walnut, or a little larger if the plant is a big one, all fine soil being shaken out of it. After crocking the pots, all the old compost is removed, so far as it can be done without injury being inflicted to the roots, and the plant is put on the crocks, and the different parts are filled in separately, as I find is best in the case of all species of Orchids. The plants when potted are returned to their old quarters, and carefully watered, taking care to see that none get over watered; but this is almost impossible if they are properly potted. From this time onwards until the plants have finished their growth, they get the ordinary stove treatment. Our space unfortunately being limited, after the growths are fully made up we remove them to a cold house, stopping the supply of water, and give them full exposure to the sun. With this kind of treatment the buds soon swell up, when they are returned to their old quarters. This kind of treatment I apply to all the Dendrobiums cultivated here, and the plants respond to it capitally. I herewith send you a specimen of some of our pseudobulbs. *Frank Lowe, Easthampstead Park.*

[The flowering growth was a magnificent one of a good form of D. nobile, and it betokened excellent cultivation, as did also some growths of the current season. Ed]

CRICHEL HOUSE.

Crichel, the ancestral home of the Sturts, is charmingly situated in the midst of an undulating and finely-timbered park. It would be difficult to find a place richer in sylvan and arboreal beauty than Crichel, and at no time in the year does the place look better than in June. The Rhododendrons, hardy Azaleas, and many other species of flowering shrubs, with which the grounds are well stocked, are in full flower in that month, and are themselves worth going a long way to see.

Crichel has several fine entrance lodges and avenues, and is situated about 7 miles south of the town of Wimborne, and at a like distance westward from Verwood Station, which, like Wimborne, is on the London and South-Western main line, from Salisbury to Bournemouth and Weymouth. These drives are very enjoyable on a bright summer's day, such as the writer was favoured with, a pleasant diversified tract of country, and quaint and picturesque villages, notably Wychampton, being passed through on the way.

Entering the park by the Chalberry entrance, the drive to the mansion of about one mile, is an interesting one. The road is about 12 yards wide for the first half mile or so, when it joins an old and much narrower one. Wide carriage-drives have a very bold and imposing appearance, and impress the visitor favourably. All drives to country houses of importance should be wide enough to

admit of two vehicles passing each other without one having to go on the turf, as is the case in some places. On either side of this avenue—a new one—are two lines of promising trees of Cedrus atlantica at the back, and common Limes in the front. They are planted 36 feet from the road, and 24 feet from plant to plant in the row. The underlying stratum being chalk, Mr. Beck affords timber trees, when planted for ornamental purposes, capacious holes and a large quantity of sound loam, to which half-inch bones in quantity are added. These trees were planted ten or twelve years ago; they are now about 20 feet high, and of great promise—handsome and symmetrical.

The extensive park has an irregular surface, and is beautifully wooded and watered. The principal kinds of trees are common Oak, Beech, Lime, Spanish Chestnuts, grand specimens of English and about 12 yards high to the ceiling, which is supported and ornamented by four massive circular pillars and five arches, ingress and egress being through the two outside arches, the intervening front space and walls on either side the steps being protected and ornamented by guilded balustrading.

The range from this portico is very extensive and brings into view a fine landscape studded with timber of great age. At some 40 yards eastward from the mansion stands a pretty church; and midway, and extending southward, evergreen Tea and other Roses are observed trained to a light iron fence—a pretty feature. To the north of the mansion the ground rises abruptly to a considerable height, and is well clothed with flourishing trees, as also is Chalberry Hill in the rear, and from the top of which the Isle of Wight can be seen on a clear day.

The pleasure-grounds are on the west and north high, was transplanted by him twenty-two years ago. Mr. Beck evidently acts up to the maxim that what is worth doing at all is worth doing well, and, therefore trees and shrubs intended for specimens or to give fine effect, are planted with much preparation of the soil. Beds and borders of flowering shrubs have been lately planted in what might be called the rustic part, or less well kept parts of the grounds; and in these beds, &c., Lilium candidum, Lily of the Valley, Snowdrops, Daffodils, Roses, Sweetbriar, Daphne odorata, Skimmia japonica are planted. An edging of Veronica elegantissima, or like plants have been afforded, and several varieties of Japanese Maples which were noticed in different parts of the ground, add a novel colouring to the rich autumn tints of the other shrubs and trees.

The flower garden is situated a short distance northward from the mansion, and is quite in keeping

Fig. 75.—view of crichel house, wimborne. (see p. 508.)

Yews; Elms, some of great age, two of which—one on either side—are seen in the view of the mansion (fig. 75), which was taken at a point some distance from the house. One huge Elm standing in the park between the beauteous lake and the east front of the mansion, measures 24 feet round the trunk, and a remarkable fact connected with this tree is worth recording. In the early part of the century, a man climbed up this tree and got into a large cavity in the centre, and so evaded capture by the pressgang. The lake has an area of 33 acres, bold and graceful outlines, and extends from a point near the house for some 600 or 700 yards in a westerly and southerly direction. It has several small islands of irregular outline, which afford capital incubating preserves for the numerous aquatic birds with which the lake is alive. A fine wooded slope makes as fine a background, as the park affords a foreground to the lake. The house is built in classic style, with porticos and massive round pillars on three sides. The principal portico, that on the south front, is about 7 feet above the ground-line, and is reached by a flight of twelve steps. It is 20 yards long, 11 yards wide, sides of the house, and they are of considerable extent, and contain fine specimens of trees, as Cedars of Lebanon, Hollies, Taxodium distichum, Acacia inermis, huge pyramids of Ivy and Honeysuckle mixed, and various kinds and varieties of choice trees and shrubs, planted by Mr. Beck, the "right man in the right place" at Crichel, where he has been employed as gardener for twenty-nine years, his employer when appointed being the late Colonel Sturt. A Cedrus atlantica, planted by the Princess of Wales in January, 1878, as well as a Mulberry tree planted at the same time by the Prince of Wales, are both doing as well-planted trees ought to do. It may here be mentioned that the Prince of Wales re-visited Crichel for the fifth time for a few days towards the end of last November.

Mention has already been made in these notes of the fine specimens, beds, and belts of Rhododendrons, and other American plants which embellish the grounds. We may here mention that a handsome, flourishing specimen of Abies nobilis, 70 feet high, was planted by Mr. Beck; and a Sequoia (Wellingtonia) gigantea near his house, and about 50 feet with the character of the grounds and surrounding objects, the beds of suitable design, being cut out in the turf in open spaces among the trees, these beds being filled with about 15,000 Tulips—Crimson King, La Reine (white tinged with rose), Amy, Yellow Prince (a fragrant variety)—and Narcissus in variety. A splendid show of bloom in April and May is the result. A number of beds have been made a short distance from the flower beds, and these are planted with some 600 of the best varieties of crimson and scarlet-flowered Roses, and other beds are planted with the choicest Gladiolus. Some idea of the number of Roses grown at Crichel may be gathered from the fact that 4000 blooms per week are sent up to Lord and Lady Alington's London house during the season.

The Lilium auratum is much planted out-of-doors, and a long border, 100 by 3 yards, is filled with them. The straight line of turf forming one side of this border, which is in front of a south wall, is effectively broken by a series of semi-circles being cut out of the green sward at short intervals, and which spaces form part of the border, and in summer

are bedded out with Fuchsias, Lilies, &c. Great cross-handled baskets being stood on the intervening green spaces, and filled with various kinds of appropriate flowering plants, the wall in the background being completely covered with Maréchal Niel Rose, the shoots being trained to a wire trellis. From these Roses 1700 perfect blooms have sometimes been gathered at one time. One can imagine the odorous air in proximity to this border when several thousands of flowers of Liliums and Maréchal Niel Roses are open at one time. Large quantities of Lilium auratum, L. rubrum, L. album, and L. longiflorum are also planted in the Rhododendron beds and clumps.

When the display of Tulips is over in the flower garden, bedding-out is begun; and large pyramids of Ivy-leaf Pelargonium Souvenir de Charles Turner and other popular varieties are made use of, besides many other plants similarly or otherwise trained, which are dotted about in suitable places. A herbaceous border, about 100 yards long and 3 yards wide, and running parallel with a trout stream and a dwarf hedge of Sweetbriar from close by Mr. Beck's house to the lake, is also worthy of passing notice.

The walled-in kitchen gardens cover an area of 4 acres, are situate in close proximity to the gardener's house, and were admirably cropped with the best kinds of vegetables. The soil, consisting of good loam 2 feet deep, is liberally manured and well worked, and thus made to yield first-class produce. The glass-houses are located in the two kitchen gardens, and consist of five vineries, three Peach-houses, besides a Peach-case 75 yards long, in which Cherries and Figs are also grown; one Cherry-house, one large span greenhouse, one Rose-house, one Azalea-house, three houses for growing decorative plants in, one Cucumber-house, one plant-stove, two houses for the culture of Souvenir de la Malmaison Carnation, which Mr. Beck, like his neighbour, Mr. Crasp, at Canford Manor, grows well; hot-water pits are provided for the culture of Gardenias, which are admirably grown.

Bouvardias are much grown, and last December a house was filled with plants eighteen to twenty years old, and from 3 to 4 feet in diameter, and smothered with pure white flagrant flowers; a truly grand display. The plants are planted out in a favourable situation in prepared soil (about four parts of fibry loam, and one of sweet leaf-mould and short manure, free from worms, with a liberal admixture of sharp sand being added) early in June, keeping the young growths well pinched until the middle of August, and affording liberal supplies of water at the roots when necessary, the plants being potted into suitable sized pots early in September. Of Malmaison Carnations, 600 young plants were potted up towards the end of September, a goodly number of them being put into 7-inch pots, and between 200 and 300 large plants were shifted into pots 11 inches in diameter, using good rough loam and ½-inch bones as a rooting medium, making the same nice and firm in potting. In the vineries fine crops of Black Hamburgh, Muscat of Alexandria, Foster's Seedling, Alnwick Seedling, Black Alicante, Gros Maroc, and Lady Downes' Seedling Grapes were noticed. There were also fine crops of Peaches; the back wall in one long Peach-house was completely covered with a veritable sheet of Heliotrope blossom. It would occupy too much space to mention even one-fourth of all the good things which were observed in the several plant and Rose-houses—fine specimens of Mignonette (Machet), Azaleas, Clerodendrons, Bougainvilleas, &c.

When visiting gardens in different parts of the country it is pleasant and gratifying to the writer to note a notable tendency on the part of some owners of large gardens to provide house accommodation not only for their head gardeners, but for the young gardeners employed under them. Crichel is one of those places. As Lord Alington has recently had an excellent house in the Swiss style of architecture put up for Mr. Beck, alongside the one he previously occupied for so many years, and which has been converted into an excellent bothy for the young gardeners, and following in the same line are the various offices, fruit-rooms, sheds, and boiler-houses. White House, where Lord Alington's celebrated racehorses are bred, is situate a short distance outside the enclosed park, and is passed on the way thence to Wimborne. Our engraving is made from a photograph taken by Mr. Hazel, Central Photographic Company, Bournemouth. *H. W. W.*

The Week's Work.

FRUITS UNDER GLASS.

By M. Temple, *Gardener, Carron House, Stirlingshire.*

GRAPE VINES.—Where fruit is ripe, and must be kept in good condition for some time, means to preserve the colour and freshness of black varieties should be adopted. Some are in favour of shading the Vines with canvas or other material; but except to preserve foliage that has been injured by red-spider or thrips, I would never exclude sunshine from the Vines, but place a sheet of dark blue tissue paper over each bunch, fastening it to the stalk, and allowing it to hang down over the fruit. With healthy foliage, Grapes may thus be kept from May to September. As soon as a Vine is relieved of its crop, a good syringing should be afforded, to remove dust or red-spider, and freshen the foliage; also water to the border, if the soil has got in a dry state, whether fruit is hanging on the Vines or not.

VINES IN POTS.—These, if there is ripe fruit on them, may be removed to a house facing the north, or to a cool dry room. Early Vines are often in danger of starting into growth too early in the autumn, and of being rendered useless for the following season, and the only method to avoid this mishap is to keep the foliage clean and healthy, and afford free circulation of air.

MELONS.—Succession plants for fruiting in the months of August and September should be planted without further delay. Their management is at this season of a comparatively simple nature, a bed of good rich loam, made very firm, with glass protection, meeting all wants in the southern counties of England; and many of the best Melons we have noted were grown in Potato-pits on plants put out as soon as the tubers were removed, the soil being made level and firm, and two Melon plants placed in the centre of each light—a shoot trained up and another down from each plant, which were allowed to bear two fruits each. From the midlands northward, bottom-heat is necessary for late Melons, and a minimum of 65° should be maintained. Many of the finest crops of Melons are still raised on hot-beds formed with manure and tree leaves, but much damage to the plants is often done at the earlier stages by allowing the rank steam from these materials to enter the frames. A heap of manure should be well turned before it is used for such beds, and put together firmly, and linings of such prepared materials supplied when the heat declines. These are the points of the greatest moment where the good old hot-bed system is practised. An evil in Melon-growing to be guarded against is the crowding of the foliage, which of itself prevents good setting of the blossoms; therefore the frequent stopping and thinning of the shoots is preferable to the removal of much foliage and stems at long intervals.

STRAWBERRIES.—Much injury is often done to fruit by keeping the roots sodden in pans of water, applying putrid liquid manure, and neglecting to supply a sufficient quantity of clear water when necessary to plants with fruit. Pits and frames should now be utilised for forwarding the late pot Strawberries; and for the earliest supply, glass protection of some kind, if placed over beds of plants specially prepared last season, will give fine fruit. Plants in smallish pots may be placed in those a size larger, with some soil or moss in the bottoms, not turning them out. The plants will throw out roots through the hole at the bottom, and derive support from the new soil there placed.

TOMATOS.—Those plants which have set their fruit-blossoms may be assisted with liquid manure, or a surfacing of artificial manure in powder form. Laterals should be rubbed off as soon as observed, and the fruit thinned out from three to six on each bunch, more being left if size and fine quality are not of importance. Pots that are filled with roots will require much water; and if the foliage should become unusually large, it may be reduced in size. I have at the present time the varieties Acquisition and Trophy doing very well in pots standing on boxes filled with rich earth, in a pinery. Those Tomatos which are planted in the borders of Peach-houses should have the soil about them made firm. It is here preferred to grow the plants in peach-houses in pots which have large holes made at the bottom, to allow of the egress of the roots into the rich soil of the boxes. Sow seeds, to afford plants for summer and autumn cropping. Seedlings should not be drawn up weakly by being deprived of light and air.

CUCUMBERS.—The Cucumber crop is abundant this season, the fine weather of March and April having favoured growth and development. The evils of applying cold water at the roots, dryness, severe thinnings done at one time, are fertile causes of bitterness in the fruit, canker, and the prevalence of red-spider. Cucumbers grow well in a high temperature, if accompanied by plenty of moisture; 75° by artificial heat will grow tender, well-flavoured Cucumbers. Cardiff Castle and Monroe's Duke of Edinburgh are very productive varieties with me this season. In frames and pits heated with manure linings, sweet fermenting manure should be applied often. Stop the shoots regularly, and prevent overcropping.

THE KITCHEN GARDEN.

By H. C. Prinsep, *Gardener, Buxted Park, Uckfield.*

SHADING NEWLY-PLANTED CROPS.—With the thermometer registering between 80° and 90° Fahr. in the shade, and bright sunshine during the day, the ground has become very dry, especially in such districts as this, where no rain has fallen since a slight shower in the beginning of March. Newly-planted stuff is almost at a standstill. In districts similarly situated, watering is often a difficult task, for unless the ground is thoroughly soaked, it is with difficulty that recently-moved plants hold their own. In this event, shade should be substituted for the almost impossible watering. Lettuce, Cauliflower, and such plants, that must be transplanted in a small state, would suffer considerably unless shaded for a few hours in the middle of the day till new roots have been formed. Treated thus, they will make rapid progress. Where boughs of any kind are available, they would assist to keep the soil moist, and greatly benefit the crops. The labour in the first instance is a considerable item, but much after-trouble and loss of time is avoided. With newly-sown Peas and Beans the rows should have a good soaking, then be covered with litter, boards, roofing-slates or anything that will prevent evaporation. As the soil is so warm the seed will soon germinate, and when the young plants appear, the coverings must be removed.

MERCURY.—This being a hardy native plant is not grown much in gardens, but in some of the eastern counties it is esteemed, therefore where required, the seed may now be sown. The plants grow apace on good ground, therefore, plenty of room should be allowed them. If sown in drills, they should be 15 inches apart, and, when large enough, the plants may be thinned out to a distance of a foot in the row. The leaves are dark green, and make a good dish when cooked. [The species our correspondent means is not Mercurialis annua, not very common in England, nor M. perennis, which is common and poisonous, but Chenopodium Bonus Henricus, a useful Spinach plant, sometimes called English, False, or Wild Mercury. Ed.]

RADISHES.—In such weather as this, a cool spot of ground must be chosen, as on the north side of a wall, building, or high hedge, for unless the plants can be kept in a growing state, the roots are tough, stringy, and hot-flavoured. The land should be heavily manured, the manure being placed in a layer just about 6 inches from the top. Use sparingly of the seed, else, if there be doubts about the vegetative power of the seed, sow thickly, and thin early if necessary.

GLOBE ARTICHOKES.—Those that were planted at the beginning of the present month will be benefited by soakings of weak liquid-manure, and if they have been properly looked after they will now be throwing up their flower-heads. Encourage the plants to grow rapidly, for the stronger the plants the finer the heads.

CARDOONS.—These should now be sown on well-prepared, enriched ground. If the soil be light or shallow, throw out trenches as for Celery, and place a layer 6 inches thick of well-rotted manure in the bottom, on which return some of the soil thrown

out and made level and firm. The seeds may be sown in clumps of three or four at 15 to 18 inches apart, thinning these plants to one in each clump.

BROCCOLI SEED.—Where not already sown, the main and last lot may now be put in. The same remarks apply to sowing this and other small seeds as were made about Peas and Beans. Shade is quite as important as watering, for if the latter be often done, the soil becomes washed hard, so that the tender plants do not grow away so quickly. Clear the land of stalks from which the heads have been cut, and prepare for digging it as soon as the weather will allow of the latter being done.

SMALL SEEDS.—If Salsafy and Scorzonera are not yet sown, the first favourable opportunity should be seized for getting in the seed. Carrots, Parsnips, and Beet should also be sown if this is not already done. Keep up a supply of Spinach and Turnips by successive sowings, for during such as the present sultry weather, Turnips soon become stringy. On poor ground, New Zealand Spinach may now be sown, as it does not go to seed so soon as the round variety. Perpetual (or Spinach) Beet should also be grown, as the leaves of this may be gathered in abundance through the summer.

[We will add a good word for Kohl-rabi, a vegetable that makes a variety of agreeable dishes, and one which is likely to prove of use should the summer be unusually warm. Sow the seeds like Cabbage or Cauliflower, transplant or not before planting finally; set the plants out 12 to 15 inches apart each way on the flat or in shallow drills; water plentifully after they once get away, and draw for use when they are nearly as large as a cricket-ball. They need no moulding up. It may here be said that plain boiling will not do, but cooking in a little soup or stock, and serving up to table with some kind of sauce, white or other, is a necessity. Sow the table, not the field, varieties of Kohl-rabi, Vienna Kohl-rabi, and early purple Kohl-rabi are the best, and the former is the more delicate in flavour ED.]

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Frogmore Lodge, Tamperley.

THE MEXICAN HOUSE.—Sobralias macrantha and zantholeuca, yellow-coloured flowers, S. leucoxantha, flowers white with a yellow throat, are splendid, if rather ephemeral Orchids, equalling in my opinion, the finest Cattleyas grown. Sobralia xantholeuca will keep in good condition from three to four days; but all the species make up for their short-lived day by the long succession of the bloom; and we have had plants which have borne flowers for a period of two months. I find that they do better on the shady or the north side of the Mexican-house, if they can obtain more direct sunlight than is thought advisable by some growers. With this kind of treatment the plants make more robust stem-like growths, and they flower more freely than when grown under shade. A good potting compost for these fleshy-rooted plants should consist of equal parts of the best turfy, fibrous loam, and the best peat that can be got, adding a good sprinkling of broken crocks and coarse silver sand. The pots should be well crocked to allow of the thorough drainage of the materials, the plants needing copious supplies of water when growing. When potting them, keep the crown of the plant below the rim of the pot, so as to allow space for the waterings. All the subjects in this house from the present time onwards should receive plenty of moisture, or a check will be inflicted. Odontoglossum citrosmum, if growing in this house, will now be opening the earliest of its flowers, and should be copiously watered; but when in full flower the plants may be taken to a drier house, too much moisture spotting the flowers. In a temperature of about 50°, they make a grand show until the month of June, at which time growth should be encouraged, preparatory to a long rest. The needful potting may be done after flowering is past, using peat and chopped sphagnum moss. The plants grow satisfactorily in shallow pans, if these are hung close up to the roof. Odontoglossum grande, O. Insleayi, O. I. leopardinum, and O. I. splendens succeed in the Mexican-house. These last-named species are liable to scale more, perhaps, than any other, and sponging with soft soap and water must be followed up. Cattleya citrina, which is a species some find difficulty with, should be grown in the shadiest part of the Mexican-house. The plant should be now flowering or approaching it, and until new pseudobulbs are formed the plants should be kept moist at the roots. Cattleya citrina grows fairly well when put on Teak-wood rafts, with a little fresh sphagnum moss, and made firm; this is better than bare rafts, moisture being kept more readily about the plants when moisture is required. It is a plant that always grows downwards, no matter how it is placed. I have potted it in shallow pans, but always found the new pseudobulb grew over the side in a downward direction. By syringing these suspended plants daily, they will need to be watered with the can but once a week. We give abundance of air, both top and bottom, whenever the weather permits, on the leeward side. The temperature should be 60° to 65° at night, with a rise of 10° by day.

THE HARDY FRUIT GARDEN.

By T. TURTON, Gardener, Maiden Erlegh, Reading.

PLUMS AND SWEET CHERRIES ON WALLS.—Unless we get rain in quantity before these lines appear, the watering of Plum and Sweet Cherry trees must not be longer delayed. The watering should be thorough, and continued until it is known that the borders are moist down to the subsoil. The continuous rains which we experienced during February, so saturated the ground, that where the soil is of a retentive nature everything has been favourable to a healthy bloom and growth. On lighter soils earlier attention with regard to watering trees would prove beneficial if given with judgment, and not in too great a quantity at one time whilst the weather is cold, but giving a moderate watering every day for about a week. Search the trees for grubs, and continue to syringe once a week for the present, using soap-suds and tobacco-juice as an insecticide.

GENERAL WORK.—Apricots will require a watering similar to that recommended above, and everything possible should be done according as the weather is genial or otherwise to encourage the fruit to grow as large as possible before they commence to stone, not neglecting a second thinning of the fruit, and sparing no pains to select those best placed to leave for the crop. In the event of the drought continuing, a good hoeing or syringing with the garden-engine will keep aphis at bay, and in other respects benefit the trees. Continue to wage war against both black and green aphis on Peach and Nectarine trees, and continue the disbudding, especially of young trees not yet in free bearing. All newly-planted and replanted trees must be regularly syringed when the weather is dry to encourage root-action. Pears, both on walls and early varieties in the open, and especially that free setting sort, Doyenné d'hiver, must have timely attention with regard to thinning the fruit. Where the trusses of blooms have set thickly, the stronger being at the base, pinch the truss down to two or three of the bottom fruits, according as the sort is large or small. Horizontally-trained trees can be induced to extend their branches by keeping pinched back the breast-wood at once.

PLANTS UNDER GLASS.

By BAILEY WARDE, Gardener, Birkhall Gardens, Ewe.

CACTUS SPECIOSISSIMUS is a useful plant to grow for a supply of bright flowers at this season, and they stand well for a long time in water. If the cuttings are allowed to dry for a time before plading them in the soil they strike freely in a little heat; and old plants will flower for many years if potted into loam, peat, and sand, with a good quantity of brick or lime rubbish mixed with it. Give them well-drained pots, keep rather dry during the winter, and give a good supply of water when growing. Planted out in a conservatory or greenhouse border with shoots trained to wall or end of house, they are easily managed.

SPARMANNIA AFRICANA.—Where space is available, plant this out against a wall or pillar in greenhouse or conservatory, the flowers and foliage being much better than when it is grown in a pot, the flowers and bright green foliage are often useful for decoration. It can be grown in pots, but it then requires well feeding. Cuttings will strike well now in heat in good sandy soil.

IVY-LEAVED GERANIUMS.—Attend to the potting and training of the double and single-flowered varieties. Afford the plants a rich loam mixed with leaf-mould and sand and supply them with plenty of liquid manure when well-rooted. If large plants are wanted grow as pyramids they form useful decorative plants. The single-flowered variety L'Elégant is useful for baskets, among the best double varieties are Souvenir de Charles Turner, Madame Crousse, H. Cannell, and Flambeau.

WINTER-BLOOMING PLANTS.—Strike cuttings now of Centradenia floribunda, C. rosea, Centropogon Lucyanus, Eranthemum Andersonii, E. pulchellum, Pentas carnea, Libonia floribunda, L. Penrhosiensis, and Kalanchoe carnea. Old plants of these should be pruned back and re-potted.

POINSETTIA PULCHERRIMA.—Push on old plants and take cuttings as soon as possible, they should be struck in small pots. Place them in a gentle bottom heat and shade well from bright sunshine.

LINUM TRIGYNUM.—Push these on in a little heat, and when they have made a start, repot into good loam and leaf-mould, with a little sand and rich manure. When growing freely, place them in a house where they can be syringed two or three times a day, as they are much subject to the ravages of red-spider; a cool greenhouse suits them well during the summer.

GESNERAS, TYDEAS, AND ACHIMENES.—Bring these on as required, and see that they do not remain too long in a dark place. Gesnera foliage should be kept well over the sides of the pots, and the growths should be dwarf and as strong as possible. Achimenes will grow and flower well in a warm greenhouse during the summer months, and are better without fire-heat, they will be benefited by a little shade during bright weather, also by well diluted liquid-manure twice a week.

THE FLOWER GARDEN.

By T. H. CRIPPS, Gardener, Cranford Manor, Wimborne.

HERBACEOUS SPECIES OF LOBELIA.—These tall-growing plants, of which cardinalis and its variety Queen Victoria, and syphilitica are the best known, make a grand display, and if seed be sown at the end of next month, and the seedlings grown on and wintered in frames from which frost is excluded, strong plants will be raised for planting out at this season. The soil in which they are grown should be well enriched with decayed manure, for they cannot be too liberally treated in this matter. The dark crimson foliage of strong healthy plants is very striking, as are the spikes of scarlet flowers. They look well planted in masses, or mixed with other plants.

SWEET PEAS.—The earlier sowings of these plants will in some early places now require to be supported; and if another sowing be now made, the bloom will be much extended.

CARNATIONS AND PICOTEES.—Seeds of the so-called border Carnations and Picotees may now be sown thinly in pans, pots, or boxes, filled with some finely-sifted loamy soil, placed in cold frames, where it will germinate surely and strongly if shaded from hot sunshine, the seedlings being pricked out in boxes, &c., when 2 or 3 inches high. The final planting of these should be done before crowding spoils them. Any Lily bulbs which may have been left out of the ground till this date should now be planted. It is a good plan to make clumps of from three to twelve, and to ensure clean and rapid growth surround each bulb with half a spadeful of leaf-mould and sharp sand. Where beds of hardy annuals have been sown for summer display, and have not germinated, water the soil heavily with a fine rose water-can, and cover the ground with mats during the day.

HERBACEOUS PLANTS.—Should the dividing of the roots of plants of Helianthus, Phlox, Aster, Anemone japonica, which do not start so soon as many other herbaceous plants, have been delayed, it is not too late to do so, if care be taken, and plenty of water afforded in dry weather. The borders should be freed of weeds by hoeing them; and those made last autumn, or since then, should get a thoroughly good soaking with clean water, and a mulching of short manure round about the plants. Delphiniums and Pæonies will now require to be secured against injury by wind. The hardy species of Lilies are appearing above ground, and a strict look-out must be kept for slugs and snails, which are great feeders on the young stems. The Everlasting Pea, if the soil is rich, forms such dense masses, that it becomes at times necessary to thin some of it out to ensure good flowering.

BEDDING-PLANTS.—Bedding-plants of most kinds may be removed to cold frames, and plenty of air afforded them by day, but for the present the lights should be closed at night. Calceolarias in frames may now be exposed entirely, and planting commence about one week from this date.

EDITORIAL NOTICES.

Illustrations.—*Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited; but the Editor cannot be responsible for loss or injury.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

TUESDAY, May 2 { Orchids from Messrs. Walter Kemsley & Co., at Protheroe & Morris' Rooms.

FRIDAY, May 5 { Orchids from Messrs. F. Horsman & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—51°.5.

Ghent Quinquennial.

A few more notes may be made with profit upon the exhibition at Ghent, which was reported in our columns of last week. The Azaleas justify further remark, and the following varieties have flowers of distinct character and much beauty.

The names of the prize-winners have been previously recorded, but we may mention that the collections of Mr. Joseph Vervaene in particular, contained many choice kinds. Oswald de Kerchove was shown well; and it is a fine Azalea, the flowers semi-double, full, and large, the colour very distinct, best described as pinkish-salmon, shading off to a paler tint towards the margin. Another fine semi-double kind is Vervaenana, the flowers of a fine pink colour, very attractive against the white margin, both exhibited well in the Gold Medal collection of Mr. Joseph Vervaene in the class for sixty plants. The following are all fine kinds, and it is worthy of note that in spite of the hundreds of plants of distinct varieties shown in the classes for Azaleas, only one good plant was to be seen of A. balsaminæflora, which is a synonymn of A. Rollinsoni and A. roæflora. A very fine specimen was shown by M. Eeckhaute, and we should like to see this charming Azalea more common in English gardens. It was at one time grown considerably, but is not so often seen now. The flowers are compact in shape, like those of a Balsam much enlarged, hence the varietal name, and of a pleasing salmon colour. The plant was covered with flowers, but this was as fine as we could discover, the only example in the show, although a special class was set apart for six specimens. A very good variety shown by M. J. de Coster, Melle, named J. Halart, the flowers magenta shaded with purple, large, and handsome. Fiowers of this colour are often dull and uninteresting, but in this case unusually rich and pleasing. Other varieties that should be noted are Mammoth, the flowers of large size, but they are of excellent shape, and the colour is rose, with a shading of magenta; Mathilde, the flowers double, full, large, and delicate blush, almost white, relieved with a few stripes of carmine. When laid on a suitable ground, the striped flowers possess much beauty. A kind named Mr. Gladstone, is pretty, the flowers lilac, shaded with a rosy-tint, and semi-double; also Maistre A. de Brunyer, the flowers single, and salmon in colour, touched with red; Hardie, single, intense scarlet, and valuable for its deep colouring; Memoire de Madame Van der Cruyssen, single, delicate blush, with spots of purple; and Madame Leon Bois, showy in colour, the ground-work of the flowers white, upon which the bright scarlet stripes are in bold contrast.

We mentioned in our report last week that the varieties of Azalea mollis were amongst the more effective exhibits in the show, and the groups of M. Koster, Boskoop, and M. Pynaert van Geert, in particular, call for mention. Further allusion may well be made to this class, which is neglected in English gardens; at least, such noble plants as were exhibited at Ghent are seldom met with in this country. This Aza'ea and its many varieties are however rapidly increasing in popularity, both in pots and the open. Excellent varieties were shown in the class for so-called crosses between A. mollis and A. sinensis, a few beautiful kinds being A. F. Barron, the flowers bright orange, a rich and striking colour; Dr. Masters, brilliant yellow; J. H. Laing, orange, tinted with bright red; Comte de Kerchove, scarlet, shot with orange, bright and showy; and M. Moritz van Crayesteyn, orange-scarlet. These were in the collection from Pynaert van Geert. Amongst others is the Azalea mollis section, a few in the prize collection of M. L. de Smet, we made note of as distinct Alphonse Lavallée, red; Ernest Bach, flushed with rose; Baron Constant Rebecque, yellow; Comte de Quincey, the flowers large and creamy-white in colour, or delicate lemon-yellow, the upper segments yellow; and Consul Pecker, the flowers bright rosy-red in colour.

Note was made in last week's report of a Rhododendron named Helène Schiffner, shown by M. F. J. Seidel, Striesen, Dresden, but another kind was also shown by this exhibitor, named Kaiser Wilhem; the plant is dwarf, exceptionally free, and the flowers are borne in compact handsome trusses, the colour being rich rose. Those of the previously-mentioned kind are white, and the two forms make a useful pair for decoration or for the greenhouse. Of the curious hybrids shown by M. Pynaert between Azalea mollis and Rhododendron ponticum var., we shall have occasion to speak later on; they form a distinct section, to which M. Rodigas has given the name Azaleodendron. Mention should also be made of the very pretty Japanese forms exhibited by M. Paillet, of Chatenay, under the name of Azalea japonica lilacina.

The Bertolonias exhibited, not for competition, may be alluded to. They were shown by the firm of M. Louis van Houtte père, and comprised several varieties of attractive leaf colouring, two we singled out for special mention being Souvenir d'Antoine Chantin, the foliage of a peculiarly beautiful crimson-majenta colour, a pellucid distinct shade; and Reine Marie Henriette, the leaves barred with bright silver.

It is interesting to note that in one group of new plants introduced since the year 1890, the chief exhibits were Irises. The Iris family of late years seems to have become more popular, especially the Oncocylus Irises, as I. Lorteti. I. lupina, I. Leichtlini, and I. sindjarensis were also represented in this group; and worth mentioning also is Lachenalia aurea reflexa, the flowers of a deep yellow colour, and distinct in character. It is a plant that should become common, and a few specimens in the greenhouse would make a show. The flowers are not only bright in colour, but of large size. In a collection from M. F. Desbois, Mont St. Amand, we noted five plants of distinct character. Hydrangea Otacksa compacta is well named, the growth being, as the name suggests, and the varied coloured flowers are interesting; but more distinct than this is Cineraria maritima fol. aurea, the leaves green, variegated with bright yellow, and the variegation is not spotty. The variegated variety of Tropæolum Lobbi deserves mention, because it is variegated, but as regards its utility that is another question. A useful plant is Carex japonica aureo-marginata, the graceful leaves green, margined with yellow.

The classes for Yuccas and allied plants were interesting; many species and varieties were shown, the specimens, as a rule, remarkably well cultivated. We merely touched upon these in our report, but now allude more particularly to the Yuccas of M. Bedinghaus, Ghent—Y. Mazelli, Y. Desmetiana, the leafage of a rich bronzy-green colour; Y. gloriosa argentea marginata and Y. gloriosa aurea marginata are attractive, especially the two last-mentioned, which are good ornamental plants, the leafage in the former was margined with yellow, and in the latter creamy white.

Agave Leopold II: a fine plant was shown by W. B. Kellock, Esq., Stamford Hill, London, and the plant presented by him to the King of the Belgians. It is a cross between A. schidigera princeps and Agave filifera, the result being a distinct form, the colour deep green, and at the margin of the foliage are silvery filaments, similar to what is seen in Yucca filamentosa. The plant was well grown, and interesting as an exhibit from an English amateur. A. ensiformis and A. univittata were also shown by Mr. Kellock.

Visitors to the Ghent Quinquennial must have felt that the Belgians know well how to grow under glass such plants as Kalmia latifolia and Choisya ternata. We have never seen either of these shrubs better cultivated, especially the Kalmia, each specimen being dwarf, compact, and a mass of white flowers, excellent for the choicest kinds of decorations. It is seldom or never so well grown in England, but the Kalmias are amongst the best shrubs for forcing gently under glass. Indoor plants are the chief exhibits at the Ghent International Exhibition, as few classes are set apart for hardy flowers or bulbs, and except for the beautiful groups of M. Van Tubergen, Haarlem, the well-known hardy bulb grower, this class would not be greatly represented apart from the usual spring flowers as Hyacinths and Tulips.

As regards the outdoor exhibits, boilers, plant-houses, &c., we have already given sufficient attention to, but mention may be made of the frames of Messrs. Foster & Pearson, Beeston, Notts, which were awarded the Silver Medal. They are most useful, well constructed on good principles, and should find great favour in gardens. We have already alluded to the Gold Medal temperate-house, one of the most important exhibits in this department of the exhibition.

The boiler trials have been going on for some time, each apparatus having been tried under identical conditions. Simplicity of construction, facility of repair, and of maintenance, size of apparatus in relation to heating surface, rapidity of action, were all taken into consideration. Forty-five points (*cotes*) were assigned for economy of fuel; thirty-five to security, facility of repair, &c.; ten to rapidity of action; ten to minimum of setting "encombrement"—in all, 100 marks. Thus tested, MM. Lebœuf & Guion, of Paris, obtained 83 per cent. of possible marks (Gold Medal); M. Bekaert, of Ledeberg, 72·7 (Gold Medal); and M. Van Heddeghem, of Ledeberg, 72·6 (Gold Medal).

In the catalogue are given tabular details showing the comparative consumption of fuel, the weight of water in the cistern-reservoir, the augmentation of temperature in degrees Centigrade, the number of units of heat communicated to the water of the cistern-reservoir, the duration of the trials in minutes, the amount of heat lost by the reservoir, the amount of heat lost in the flow and return-pipes, the amount of heat absorbed by the water and metal of the apparatus and its pipes, the amount of heat utilised absolutely, and in proportion to the amount of fuel consumed; the surface heated in square mètres, the volume occupied by the apparatus in cubic mètres, the section of the chimney-flue in square mètres, and the weight of the apparatus in kilogrammes.

We shall also have other opportunities of speaking of the experiments with manures, and the chemical details concerning the soil, &c., given by M. Georges Truffaut, junior.

Linnean Society.—Thursday, April 20: Professor Stewart, President, in the chair. The Rev. A. B. Morris was admitted, and Mr. A. Trevor Battye was elected a Fellow of the Society. In view of the approaching anniversary meeting, the election of auditors took place, when Dr. Meikle-john and Mr. E. A. Bathers were nominated on behalf of the Council, and Messrs. Thos. Christy and W. F. Kirby on behalf of the Fellows. The President took occasion to notice the retirement of Mr. F. H. Kingston, after thirty-six years' service as lodge-keeper, and presented him with a testimonial in the shape of a cigar-case containing five-and-thirty pounds in bank notes, which had been subscribed on his behalf by all the societies in Burlington House. After a suitable response on the part of the recipient, attention was directed to some photographs of Burlington House, with the gateway as it existed before the rebuilding in 1868, and showing the old colonnade which had since been demolished, and was lying still uncared for in Battersea Park.

—— On the occasion of the evening meeting, which will be held on Thursday, May 4, at 8 p.m., the following papers will be read:—1, "Nervous System of Myocine Glutinosa," by Alfred Sanders, F.L.S.; 2, "On Polynesian Plants, collected by J. J. Lister, Esq.," by W. B. Hemsley, F.R.S., &c.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—Last Friday evening a meeting was held in Redland Park Hall, Bristol, for the purpose of advocating the claims of the Gardeners' Royal Benevolent Institution. J. H. LOCKLEY, Esq. (late High Sheriff for the county), presided, and was supported by T. WALLS, Esq. (town councillor), Dr. SHAW, and other influential gentlemen. It was explained that Mr. HARRY J. VEITCH (Treasurer of the Society), who had been announced to give an address, was unable to be present through pressure of business. The sum of £20 a year, said the Chairman, at which old age pensions were fixed, meant 8s. a week; and the majority of societies in Bristol, some of which had been in existence for 150 years, rarely apportioned to a man or woman who had reached the eligible age a larger amount than this. If this Society could be induced to open a branch in Bristol and the neighbourhood, he felt quite sure of this—that by the gardeners themselves showing they had an interest in the Institution, which was established purely for themselves, there would be no lack of outside interest to help them. Mr. GEORGE J. INGRAM (Secretary) followed with an exhaustive address on the principles, objects, and needs of the Institution; after which it was unanimously resolved to form an Auxiliary for Bristol, Bath, and neighbourhood.

EARL'S COURT EXHIBITION.—We understand that the Commissioner of woods and Deputy-Surveyor of the three Crown forests will send in large exhibits. Amongst these may be mentioned fossil trees, specimens of the duration of the marking of trees, with forest tools and other appliances in general use in forests. By the kindness of the Committee of council on Education and the South Kensington authorities, an instructive collection of colonial woods showing their breaking resistance will be on view. Pictures of forest trees and scenery will form an attractive adjunct. The trustees of the British Museum have also sanctioned the loan of duplicate specimens of British woods. From other sources, both public and private, examples of the size to which acclimatised trees attain in this country, together with data of the soils in which they find their most congenial resting-places will be sent. Similar objects in the way of growing trees in the outside gardens will be found. An interesting display in this way will be made by Mr. C. TURNER, Royal Nursery, Slough, in one large Pear-shaped bed, divided into three interesting sections, viz., one to represent forest stuff grown in heavy soil, one in chalk, and one in light soil. The Slough firm will also plant numerous other beds and borders, as will Messrs. LEE & SON, Royal Vineyard Nursery, Hammersmith; WILLIAM PAUL & SON, Waltham Cross; and others. Whilst a good Rhododendron display by Messrs. H. LANE & Co., Berkhamsted, will impart a welcome change, when in flower, to the more sombre forestry surroundings of the gardens, which, it may be mentioned in passing, have been this year remodelled and considerably improved, under the directions of Mr. H. E. MILNER the distinguished landscape gardener, and Chairman of the Executive Council of the Exhibition. The different "styles" of gardening exemplified last year are not necessarily repeated this season. At the northern end of the building will be found, as last year, a bit of flower gardening under cover, laid out with grass plots, walks, and raised beds planted with fine Palms, Tree Ferns, choice flowers, flowering shrubs, &c., by some of the leading nurserymen and florists. Here, then, in case of an inclement season, these attractions may be enjoyed regardless of weather. In this main building another special feature will be the display of ornamental English and foreign woods, shown in their

FIG. 76.—AZALEA MOLLIS, VAR. ANTHONY KOSTER: FLOWERS, YELLOW, SHADED WITH ORANGE.

(Shown by Messrs. H. Lane & Son, of Great Berkhamsted, at the Royal Horticultural Society's Meeting, April 11, 1893. See Report in *Gardeners' Chronicle*, April 15.

application to furniture, the interior decoration of houses, &c., also other interesting exhibits of a horticultural nature. Here will also be found some of Messrs. Pulham & Son's rockery creations. A Happy Valley will take the place of the Long Walk, Windsor Forest. Close here will be found Messrs. Cheal's interesting exhibit, referred to in more detail recently. The Lakes of Killarney, too, in the Western Gardens, will find hosts of admirers of this famous spot. These are only mentioned to introduce instances amongst other good things in the special way which will attract attention. A reminiscence of the Naval Exhibiton will be found in the shape of a model of the Eddystone Lighthouse, and a novel attraction will be a *facsimile* of the Paris Bastile. The arena which the Wild West Company occupied last year is being converted into a lake, wherein will be given aquatic exhibitions of various kinds. Most tastes, then, have been considered in this exhibition, for in addition to the attractions just briefly reviewed, a series of fortnightly flower shows have been arranged.

Mr. D. Morris.—We are glad to learn of the return of the assistant-director, Royal Gardens, Kew, from his sojourn in Teneriffe in restored health. Further, by the courtesy of Mr. Morris, we hope to be able to publish some of his observations on the vegetation of the island, and its relations to the climate.

The "Raout," Ghent.—The dominant principle that was to have regulated this meeting of horticulturists from all countries may be expressed in the following aphorism—"Le libre-échange est la force de l'industrie horticole." This sentiment was further illustrated by the presence on the previous day of the eminent free-trader, M. Léon Say. Whether or no at the raout in question the cause of free trade was advanced we cannot say, but we can safely assert that there were no restrictions on talk on the occasion.

"Report of Observations on Injurious Insects, 1892."—The sixteenth annual report by Miss Ormerod, published by Simpkin, Marshall & Co., is a valuable illustrated record of the insects which made themselves specially objectionable in 1892. Note is also made of the slime-fungus producing the disease known as finger-and-toe in Cabbages, and of the eel-worms of Tomatos.

"Iconography of Candolleaceous Plants."—Baron Sir Ferdinand Von Mueller has issued through the Victorian Government the first part of an illustrated Monograph of Candolleaceous Plants (formerly Stylidiaceæ)—plants remarkable for the movements of their style, and many of which are in cultivation as ornamental greenhouse plants. We shall revert on another occasion to this interesting publication.

The Gardeners' Orphan Fund.—The supporters of this very excellent charity dined together in considerable numbers on Wednesday evening last, at St. James's Hall, Regent Street, Baron Ferdinand de Rothschild in the chair. The chairman well urged on his hearers the claims of the children of gardeners on the bounty of the members of the craft in all its branches in particular, and that of the public in general. Speeches were made by Sir Trevor Lawrence, Bart., M.P., H. J. Veitch, Esq., N. Sherwood, Esq., Professor Walker, and others. The sum of money collected or subscribed on this occasion amounted to £550, including £100 from Messrs. Hurst & Son, £50 from Baron Ferdinand de Rothschild, Messrs. Rothschild, £25; Sir. T. Lawrence, Bart., M.P., £10 10*s*. Flowers were sent by Messrs. Wills & Segar, Sander & Co., Williams, Laing, J. Smith of Mentmore, Walker of Ham, &c.

The Hortus Lodge of Freemasons.—On Thursday evening a considerable number of horticultural members of the Masonic fraternity from various parts of the country assembled at Freemason's Hall, Great Queen Street, W.C., to take part in the consecration of the Hortus Lodge, for the establishment of which H.R.H. the Prince of Wales, M.W. Grand Master, has been pleased to grant a warrant of constitution to a small but influential body of metropolitan horticulturists. We understand that membership of the new lodge is to be restricted as closely as possible to members of the horticultural community.

"Report on Insects and Fungi Injurious to Crops, 1892."—We note the publication by the Board of Agriculture of this report with great pleasure. We have so often called attention to our lamentable deficiencies as compared with the energy shown in the United States and some European countries, that it is a great pleasure to welcome a report on the insects which have been noted as specially injurious during the year to our farm and garden crops. The insects are described, their life-history given, and excellent coloured illustrations afforded. Among them our old acquaintance the red-spider finds a place. An article, also illustrated, on the club in Cabbages follows. In each case the appropriate means of prevention, palliation, or cure are given. The work may be had from Messrs. Eyre & Spottiswoode for two shillings.

Cumberland Magistracy.—The name of Mr. James Watt (Little & Ballantyne), nurseryman, Carlisle, appears on the list of new county magistrates for Cumberland. Mr. Watt has for several years taken an active part in the administration of justice on the Carlisle bench of magistrates, and has recently been elected chairman of the Conservative party in the northern parliamentary division of the county.

Presentation to a Midlothian Horticulturist.—A presentation was made on the 13th inst. (*vide Evening Dispatch*), at the Royal British Hotel, Edinburgh, to Mr. M'Hattie, gardener to the Marquis of Lothian, at Newbattle, on his departure to assume the charge of the gardens of the Duke of Wellington, at Strathfieldsaye. There was a large attendance of members of the Scottish Horticultural Association and other friends, including several ladies. The Rev. J. Carrick, Newbattle, presided. Mr. Malcolm Dunn made the presentation, which consisted of a gold watch with appendages, and a purse of sovereigns, while at the same time Mrs. M'Hattie was presented with a beautiful ring. Mr. M'Hattie made an appropriate reply.

Conference on Technical Education at Cambridge.—The Cambridge University Extension Syndicate arranged a conference of representatives of County Councils, of other universities, and of other persons interested in technical education, at Cambridge on April 20 and 21 next, to discuss the relations of the universities to the County Councils in respect to technical education. Cam bridge has, during the past year, provided courses of lectures on various scientific subjects coming within the scope of the technical instruction acts for eleven County Councils, as well as for the technical education committees of other local authorities. A large part of the work done has consisted of simple scientific teaching in villages and small towns, and the attempt thus made to bring the universities into closer relation with rural districts has naturally led to results of considerable interest and novelty. The results of such work, and the most effective way of making progress in the future, were among the subjects discussed at the conference. Another item was the scheme for systematic instruction in agricultural science at the university, devised by Professor Liveing and others, in co-operation with several of the County Councils.

Winchester and District Gardeners Mutual Improvement Association.— The committee of the above, we are requested to inform our readers by Mr. F. Broomer, hon. sec., have arranged for a practical test of the value of the reputed preventatives of Potato disease during the present season. The application of the remedies to be made before all members who care to attend.

Mr. Dodwell writes from Stanley Road, Oxford:—"Will you allow me in your columns, on behalf of my wife and myself, to return our most grateful thanks to our many friends for their congratulations and sympathy on the occasion of our Golden Wedding. Very devoutly we thank them, and thank God, for this pleasant sunlight of our evening days, and we hope we shall be permitted to have the joy of personally tendering our thanks to a large company on August 1, the day appointed for our annual Carnation Feast."

"Natural Science."—The April number of this publication, issued by Messrs. Macmillan, now in its second year, contains several articles likely to interest our readers. In one the writer urges those who watch the early opening of flowers to ascertain also whether these precocious flowers produce fertile seed more freely or less freely than later produced flowers. No one, it appears, has observed whether the dead Nettles which flower more or less all the winter produce seed from those flowers. An interesting article on the life and work of Christian Konrad Sprengel, should encourage members of field clubs and amateurs by showing what great results may follow from the careful observation of phenomena unnoticed in the first instance by professed naturalists. The subject of the relation of ornithology to horticulture and agriculture is discussed in relation to the volume of essays on the subject edited by Mr. Watson. The value to the farmer of birds of prey, such as owls and hawks is noted; starlings are marked as among the best of his friends, and sparrows as the worst of his enemies.

Cattleya Trianæi.—M. Duchartre, in the *Journal de la Société Nationale d'Horticulture de France*, calls attention to the very general error committed in omitting the final *i* in this name. The plant was named in honour of the well-known Colombian botanist, Triana, and not in that of his wife.

Botanist to the U. S. Department of Agriculture.—Mr. Frederick Vernon Coville, one of the staff of the botanical section of the Department of Agriculture of the United States, and recently associated, says *Garden and Forest*, with Mr. E. Hart Merriam's Death Valley Expedition, has been appointed chief of the botanical division of the department, in place of the late Dr. George Vasey.

Book Notice.

Manual of Orchidaceous Plants.* Part IX.

The last part of this useful and exhaustive work on Orchids is the largest and, in consequence of the number of genera dealt with, probably the most difficult to produce of any of the series. The principal genera treated of are Cymbidium, Zygopetalum, Lycaste, Acineta, Anguloa, Bifrenaria, Cochlioda, Comparettia, Cycnoches, Grammatophyllum, Galeandra, Maxillaria, Mormodes, Rodriguezia, Stanhopea, and Trichopilia, and under these genera are brought many others which are known under genera erroneously created or have been wrongly placed. For example, Zygopetalum in Messrs. Veitch's work embraces Pescatorea, Bollea, Batemania (except the type species), Huntleya, Warscewiczella, Warrea (in part), Kefersteinia, and Promenæa. This has been deemed, for a long time, the correct scientific classification, and steadily but slowly the proper names are getting into use in gardens, but it is surprising what a hold an erroneous name has on the cultivators of plants if it be the name under which they first received it, and which seemed to be backed by a proper authority. For this adherence to a name once recognised, the gardener is not to blame, unless he persistently refuses to avail himself of the means to arrive at the correct nomenclature conveyed so continuously in the horticultural papers, and in such clever and reliable works as that at present under notice, which, with the next issue—a general review of the Orchidaceæ will complete the best work on cultivated Orchids ever issued, whether as a reference to the history, culture, or science of the Orchid family. Part IX. extends over 194 pages, and, like its predecessors, is profusely and beautifully illustrated throughout. Under each of the genera in which hybrids have been obtained, descriptions of them are given, together with much useful information, and in some instances illustrations. At p. 67 is a very interesting illustration of Zygocolax Veitchii ×, and its progenitors, Colax jugosus and Zygopetalum Mackayi crinitum (by a slip of the pen erroneously lettered Maxillaria M. crinitum), and their pollinia, giving a singular example of the effect of crossing plants distinct from each other in the form of their flowers, exhibited in the progeny.

* *A Manual of Orchidaceous Plants Cultivated under Glass in Great Britain.* (James Veitch & Sons, Chelsea, London, S.W.)

Paris.

Jardin des Plantes.

It is never possible to visit this fine old historical garden without finding something of great interest and beauty in flower. There are many plants worthy of note at this moment, and as Pæonies are now coming on, it may be mentioned that there is a fine specimen in bloom of the true and excessively rare Pæonia Russi. No one could ever mistake this species; it has hairy leaves, with distinct leaflets, and large red flowers, making a fine ornamental plant, about 2 feet high. The new P. lutea is coming into flower. Among shrubs, Syringa pubescens is a charming novelty, with smallish panicles of pale lilac flowers; its habit is slender, and the leaves are not unlike those of S. persica, to which perhaps, it is most nearly related. The original tree of Paulownia imperialis, introduced in 1834, is producing quantities of bloom, though it is not so ornamental as might be expected from the character of the flowers. At any rate, it is a very fine specimen, with trunk not much less than 2 feet in diameter, and a spreading head of 35 or 40 feet through, and about the same in height.

In the houses we are compelled to remark the exceptional number of new and rare plants, received from the correspondents of the establishment; they comprise numerous kinds of economic interest, as well as others apparently of much ornamental value; but for the present, to note examples of the plants of special interest in flower, we may turn to Roxburghia viridiflora and Ungnadia speciosa; the former is, perhaps, of botanical rather than general interest, but at the same time the flowers are attractive. As the name indicates, they are green; the segments are acuminate, forming a campanulate flower, that broadly suggests Trillium, and these curious flowers are borne by a plant with much the habit of Smilax. To be correct, we must now call this plant Stemona gloriosoides, a name that is not inapt in its descriptive portion, but the segments are four, in two series. This used to be our only representative of the Roxburghiaceæ, but the plant was lost to Britain, while now more recently Stemona Curtisii has been introduced to Kew (*Bot. Mag.*, 1892, t. 7854).

We were delighted to see the above-mentioned Ungnadia speciosa, and in flower too. It is decidedly rare, and as certainly ornamental as might be expected of any reasonable relation of the Horse-Chestnut. The flowers are rosy-pink, not large, but numerous, occurring in corymbose fascicles on apparently the old as well as the young stems. Unfortunately it is not hardy, and was here growing in the greenhouse. Its relationship is easily detected, but it presents the interesting aspect of a distinct and charming type. Friends in Texas might send home seeds, taking the precaution of packing in soil, just suspiciously damp, since on various occasions they have arrived quite dead. *R. I. Lynch.*

Round Ghent.

Bruges.—When *en route* for the recent exhibition at Ghent, we were constrained to alight at the fine old city of Bruges, and drive out to Scheepsdaele to see the wonderful cultivation of Odontoglossums and other Orchids pursued by M. Vincke-Dujardin in the vast and peculiarly-constructed set of houses arranged by him for these plants. We say peculiarly constructed, for although each block contains eleven large and long houses in the one block, and sixteen similar structures on the other side of the walk, the blocks of houses measuring some 200 yards in breadth, in each case there is really no party wall, and it is possible to pass from one side to the other of each block, so that practically, so far as that portion beneath the staging goes, and in which the piping is arranged, each block of houses is but one vast, well-heated, well-ventilated structure, of low elevation, and of a number of spans corresponding to the number of houses in the block. This arrangement is said to greatly simplify the culture of showy Orchids, which are grown in quantities, and certain it is that by its aid, and by the knowledge gained by the continuous study of the habits of the plants by M. Vincke, the Orchids cultivated at Scheepsdaele will compare favourably with any in Europe. The cultivation of none but showy Orchids is essayed, and preference given to those which fetch a good price as cut flowers, and especially such as come into bloom in the winter. Of such are the varieties of Lælia anceps, of which there is a splendid houseful, and from them the cut flowers at Christmas averaged for a short time 1000 blooms per day. Odontoglossums—principally O. crispum, O. Pescatorei and O. triumphans—occupy the greater part of the space. Some idea of the quantity may be gained when we state that there are twenty large houses entirely filled with Odontoglossums, ranging from those last acquired, which fill some eight or ten houses, and which have not yet bloomed, through all stages up to the houses of specimen plants. Their bulbs are very large, and exhibit in every instance the rapid increase in size which has taken place each year. One thought suggests itself, viz., that the annual increase in the size of the bulbs cannot go on for ever, or even in a few more years, they would be as large as one's head. What happens? Deponent knoweth not! Probably Nature will assert herself; rest, or retrogression for two years, next ensue, and the plant commences its onward march anew. So fat and sleek were the bulbs of the Odontoglossums, so broad, green and luxuriant the foliage, that we ventured to put the question as to whether there was any truth in the report that continental growers used manures to them. The reply was unhesitating. "You, who know so well the structure of an Orchid root, and the nature of the plants, will readily believe me when I tell you that, speaking for myself, I am not insane enough to attempt such a thing. A feeding air and our good rain-water is all we require." The spikes of the Odontoglossums showed them to be as good in flower as in growth, and in the various houses the Cattleyas, Lælias, Lycastes and other Orchids were in an equally fine and healthy condition. Of Cattleya Mendelii there was a grand lot in bloom, also a good show of C. Lawrenceana and C. Mossiæ. Of Cypripediums there was a grand show both of species and hybrids, C. villosum albo-marginatum and C. v. aureum magnificum being specially distinct. Cattleya Schroderæ and Lælia purpurata showed up well, the house of Miltonia vexillaria was thickly set with stout spikes in bud, the scores of plants of Maxillaria Sanderiana were about to flower, the largest specimens being 3 feet through; Odontoglossum Edwardii and O. Harryana were well in bloom, Cymbidium Lowianum in many fine specimens, and the hybrid Odontoglossums many and varied.

Palms are also well cultivated, and Dracæna australis, D. lineata, &c., have been in the open air over a month. Thousands of Bay trees in tubs of all sizes and ages are cultivated as a specialty, the greater part of the stock being standards and pyramids of great age. One pair was pointed to with pride as having been in the family for 125 years.

(To be continued.)

Home Correspondence.

Packing Grapes.—Some thirty-two years ago, when I was working as an under-gardener at Holly Bush Hall, in Staffordshire, a system of packing Grapes was there practised which I have never since seen mentioned in the many discussions thereon in the horticultural press. The gardener was a Mr. Buck, who at that day was well known in the locality as a thorough gardener, more especially in fruit culture and kitchen gardening. I may also mention, he was a great admirer of and supporter to the *Gardeners' Chronicle*—he has long been dead. Personally, I owe to him much useful information on general practical horticulture. His plan of Grape-packing was as follows:—Stout boxes were procured, similar to what are in use now, and in size according to the quantity of Grapes to be packed. The packing material was simply Strawberry leaves, cut with a small sickle the day previous to packing. They were spread thinly on the capacious flue that ran along the back of the well-cropped lean-to vineries, so as to get wilted. In cutting the leaves, care was taken to keep them clean. The required quantity of Grapes being cut and laid in a flat basket, a layer of the soft Strawberry leaves was pressed firmly on the bottom of the box, then a layer of bunches of Grapes; then more leaves, and a second layer of Grapes, the whole being filled with more leaves in quantity sufficient to tightly fill the box when the lid was nailed down. I was assured by Mr. Buck that these Grapes invariably travelled well, and with less loss of bloom than when packed with paper and other materials, he having tried other methods, and compared results. I well remember that several parcels were sent into Wales at that time, when travelling was not so expeditious as now. Of course, I am well aware that the plan is not applicable to packers of large quantities of Grapes, but for those who have occasionally to send a box away during the summer months, I am persuaded the system merits a trial. It may seem a barbarous practice to cut off Strawberry leaves for such a purpose. When possible, they were procured from a portion of the plot that was to be done away with, and after the fruit was picked. At that time it was often a custom to cut off the leaves, say in August, even from the plants to be left, and especially so with such varieties as Grove End Scarlet and other free-growing kinds, cultivated in beds to supply quantities of fruit for preserving purposes. The soil at Holly Bush was what is termed a Strawberry soil, it being a rich red marly loam, if I rightly recollect; at any rate, Oaks and Hollies flourished grandly thereabouts, it being

but a short distance from the famous forest of Needwood. Leaves from Sycamore, Beech, Hazel, or any other non-resinous tree, would answer as well as Strawberry leaves. The main points are to have them clean, and get them "wilted," by cutting the day previous to using. Perhaps if any of your readers have tried the plan they will chronicle the results. *H. J. C., Grimston.*

THE VIOLET PLUM OF EAST ANGLIA.—It is astonishing how little is known of this valuable Plum. As an ordinary market fruit, it has scarcely an equal, when all points are considered. It comes perfectly true from suckers, when the tree is on its own roots, and bears well in a young state; as a rule, it is very hardy and prolific. The fruit is in shape oval, dark violet in colour, and covered with a dense bloom. It is alike good for dessert or cooking. Your correspondent at p. 421 may well say there is considerable mystery hanging over these Violet Plums. I have been in different parts of the kingdom, and seen several so-called "Violets," but never the true one of East Anglia, and, like "An Anxious Inquirer," I should be pleased to hear more about it. I once asked a noted eastern counties gardener if he could tell me the correct name, but he could not, and said that the only name he had ever heard them called was Violet Plums. I hope a sample may be sent to the Fruit Committee of the Royal Horticultural Society this year, so that its true name may be ascertained. I incline to think it is a local variety, and is not known in commerce. *J. Easter, Nostell Priory Gardens, Wakefield.*

THE SOWING OF BROCCOLI SEED.—The season of seed-sowing having again come round, I should like to name some half-dozen varieties of Broccoli which, after trying many kinds through a number of years, I have selected as being worthy of cultivation. The names are placed in their order of succession, viz.:—Winter Mammoth, White Sprouting, Vanguard, Standwell, Bouquet, Late Queen. The last two may be taken as coming in together, so some may not care to grow more than one of them. I like to have both, the small heads of the Bouquet always making a nice-looking dish. *H., Mid-Sussex.*

STRAWBERRY JOHN RUSKIN.—Having grown fifty plants of this new variety with the same number of President and Paxton for trial, I find it a fortnight earlier than either of the two older varieties; quite healthy, a free setter, good cropper, and of fine colour. *E. Dyke, Topsham.*

—— I was so pleased with the above Strawberry outside last season that I determined to try it for early forcing, but it proved a failure, being covered with mildew. Growing in the same house were Sir J. Paxton, Laxton's Noble, and Auguste Nicaise perfectly clean, with plenty of fruit on them. *F. J. T., Sunningdale Park.* [Enough has now been said about this variety, and it seems from the correspondence we have published in these columns that in some localities it is subject under glass to mildew, and in others it is free from this parasite, just as are some other varieties. Where it is not found to do well, it is prudent not to force it. Ed.]

POPPIES.—A correspondent, I observe, advises the sowing seed of Papaver umbrosum in small pots under glass early in the spring, for planting out. No doubt for spring-sown plants this is the best course, because all these Poppies transplant badly, unless well established singly first. But the umbrosum and Shirley Poppies are of the hardiest, and if seed be sown in the open ground the first week in September and later, the seedlings well thinned, so that the plants may be very dwarf and stocky, they will transplant, if needed, with good balls of soil attached, early in the spring, and in that way not only develop into flowering plants double the size of those raised from seed in the spring, but will flower much earlier and far more profusely, indeed we rarely see these Poppies at their best unless thus treated as biennials. The Iceland Poppies do best treated in the same way. As to P. orientale and P. bracteatum, seed of these sown now will give very good flowering plants for next year, and they will continue to increase in size and blooming power indefinitely. If the former varieties are the best for cutting purposes, and few flowers are lovelier for vase or ordinary domestic decoration, these latter perennial forms are amongst the most effective of border plants. The foliage alone is often of the noblest and handsomest, but when the plants are blooming, they are then grand objects. The French Poppies are very beautiful too, and very varied in character and colouring, but are all too fugitive. No one cares for their somewhat strong perfume, or to use them for domestic decoration. For this purpose none excel the Iceland and Shirley forms. *A. D.*

PETROLEUM AND INSECTS.—In reply to S. H. Trott and others, I feel they will be relieved of much trouble in destroying insects infesting plants, and also plant-mildew on subjects, however tender, by making use of the following prescription, which has no equal, and, moreover, is cheap and always ready to hand. I have no hesitation in here stating that paraffin (petroleum) can never be used with safety on any plants until it is prepared, and made to mix easily with water, and paraffin (petroleum) soap is safe in use and efficient as a means of killing all kinds of insects, as years of experience has convinced me. I make the soap as follows:—Take 7 lb. of soft-soap, 2 quarts of petroleum, 2 oz. of sulphate of copper dissolved in half-a-pint of hot water, allowed to stand till quite dissolved, then put in an iron bucket or pot, and boiled till all is well mixed together, keeping it meanwhile stirred. It is then fit for use, and if put into tin boxes or earthenware pots, it will keep good for years if the air be kept from it. For use on stove, greenhouse, and tender plants put 1 oz. of the soap in 3 gallons of water, small plants may be immersed in, and large ones syringed with it. For Roses, Peaches and Cherries put 2 oz. into 3 galls. of water to destroy the black and green aphis. I hope S. H. Trott will give us his opinion on the results of his trials in these pages. If agreeable to Editor I will give one of the prescriptions for winter-dressing Vines and Peach trees. *W. S.* [Please to do so. Ed.]

PEARS ON THORN STOCKS.—How seldom is the Thorn used as a stock by the gardener for the Pears, yet it possesses plenty of fibrous roots, and the Pears make good fruitful wood. I have a Pear tree growing on this stock, which has lived quite three-quarters of a century, is still covered with bloom, and looking a picture of health and productiveness. Medlars also grow and fruit remarkably well on this stock. *R. E. Brain.* [The Thorn is not to be recommended as a stock for the Pear, its growth being too slow; for the Medlar it answers well enough. Ed.]

CALLA PENTLANDII.—On December 14, 1893, at Messrs. Protheroe & Morris' Sale Rooms, Cheapside, some tubers were sold of a new Calla, provisionally named Pride of the Congo. We have a plant in flower from the same, which proves to be Calla Pentlandii, yellow spathe, with dark patch of colour at the base. *C. J. Salter, Woodhatch Lodge Gardens, Reigate.*

WEATHER IN WARWICKSHIRE.—I enclose spray of Hawthorn blossom picked off a hedge in my Nursery. Is it not unusually early? I do not remember seeing any open before in April. The temperature has been unusually high lately, as the following figures will show. Thermometer in the shade at 3 feet from the ground, maximum each day, April 18, 68°; 19th, 74°; 20th, 82°; 21st, 78°; 22nd, 70°; 23rd, 76°; 24th, 75°; 25th, 81°. We have almost unbroken sunshine; the rainfall very slight, viz., ·41 of inch in March, and on April 16 and 17, ·32. Naturally, farmers and gardeners want rain badly. Our Apple trees are a picture, being literally covered with bloom. *Thos. Woodford.*

ERYTHRONIUM HARTWEGI.—I have sent specimens of Erythronium grandiflorum, and also the new E. Hartwegi, which I have been the first to introduce to European gardens. It has been described by Sereno Watson in vol. xiv. of *Proc. American Acad. of Sciences*, and I think highly of it, as it is really a very beautiful plant. The specimen sent is one of the latest of the lot, as the E. Hartwegi precedes the E. grandiflorum by fourteen to twenty days. As the flowers are all sessile, the bed presented a very beautiful, even sight; the spike of E. grandiflorum is very much higher, and is branched. I hope the flowers will reach in fair condition. *C. J. Van Tubergen, Jun.*

SPRING GARDENING AT WILTON HOUSE, SALISBURY.

A visit to Wilton House Gardens is at all times interesting and instructive to horticulturists, but especially so when the visit is made in the early part of the leafy month of June, as was the case in this instance; because, in addition to the pleasure which a peep at the luxuriant and variously-tinted foliage of the noble trees in the beautiful and well-kept grounds and park surrounding Lord Pembroke's charming Wiltshire seat afford, there are then a variety of seasonable work and cultural plans being carried out, and early crops indoors and out are about at their best, while general crops and work are sufficiently advanced to admit of the critical observer arriving at a pretty correct opinion as to what kind of results the treatment being followed will lead, and thereby including or omitting in his own practice as he may see fit, the cultural treatment which lead up to the achievement of those results. These latter remarks are equally applicable to the benefit which a horticulturist generally derives from a visit to any leading gardening establishment at the same time of year.

Now, for the spring bedding. Mr. Challis, who has ably presided over Wilton House Gardens for, we believe, over thirty years, with credit to himself and satisfaction to his employers, goes in largely for bedding Pansies in the arrangement of the beds for spring effect, and with excellent result. The beds occupied with Pansies of various shades of colour were everything that could be desired, being well filled with healthy and profusely-flowered plants—plants which it seemed a pity to remove to make way for the proper summer occupants of the beds. Among the varieties grown, in addition to Viola Golden Gem and V. Blue Bell, may be mentioned Blue King, cobalt-blue, with a purple blotch; Cliveden Purple, purple; Imperial Blue, blue; Cliveden White, white, very floriferous; Cliveden Yellow, yellow, dark centre; and Countess of Kintore, deep blue-purple, edged white, distinct and very showy. The beds of Aubrietia, Forget-me-nots, and Wallflowers were over at the time of our visit, and were being replaced by other subjects, but several well-flowered plants of herbaceous Pæonies in the side borders were very telling, there being several new varieties amongst them, including a beautiful silvery-flesh-coloured one, apparently Astræa. In addition to the above-mentioned subjects, various bulbous and other plants are employed in making the beds gay with a variety of pleasing colours during February and three following months.

Any remarks on spring gardening at this fine baronial residence would be incomplete without reference being made to the reserve garden, which is in close juxtaposition to, but out of sight of, the flower-garden; it being enclosed by a high and well-kept Yew (I believe) hedge. This enclosure covers an area of about half an acre, and is tastefully laid out in beds about 4 feet wide, each being edged with Box, and having a gravel space of 3 or 4 feet wide between. The whole being scrupulously clean and tidy, and several of the beds devoted respectively to the several varieties of Pansies, &c., were well worth a visit to see. In this way the varieties are kept quite true to name, the plants being propagated by cuttings, or division of the roots, and a good stock is always at hand wherewith to make good any blanks that may occur in the flower-beds during the interval from October to the end of spring. *H. W. W.*

MARKET GARDENING UNDER GLASS.

(Continued from p. 416.)

Mr. J. Emerson, Hextable.—Adjoining the nursery of Messrs. Pitcher & Manda is the establishment belonging to Mr. Emerson. Many of the houses are erected upon such an extreme slope that at a distance they appear as if they might actually fall. These are well-built houses, most of them new, and are 180 feet long by 17 feet wide. All of them are intended for the accommodation of Strawberries and Vines, with an after-crop of Tomatos, &c. There are about 17,000 Strawberries in pots, and all Sir Joseph Paxton. They are grown without any heat whatever. A similar treatment is destined for the Vines, which fill one or two of such houses. This is at present an experiment, for the Vines are young, and have not yet been cropped, excepting a bunch

r two last year, which Mr. Emerson says coloured nd ripened well. The varieties planted are Hambro nd Alicante, and Mr. Emerson seems quite sanguine hat they will succeed under these conditions. The wonderful slope of the houses will perhaps ender this probable. Nearer the foot of the slope re a number of Cucumber-houses. Cucumbers are rown in quantity, and it is expected that for six nonths of the present season there will be an output veekly of twenty to thirty dozen fruits. They are ot quite so early as we have noticed elsewhere, but hey are looking remarkably well and promising. Tomatos are in about the same proportion. Chrysanthemums are grown to the extent of 17,000, nany of which are planted out in the open, and afterwards lifted to the houses. Perhaps the greatest feature of the winter, however, is the large stock of Callas which has produced as many as eighty to 100 dozen blooms in a week. Mr. Emerson said that these paid him as well as anything, and as regards supply and demand, it was very rarely his experience to be unable to clear his stuff. There was always a market for good produce, though at times the prices depreciated to some extent. Another small place on the other side of Hextable has been purchased, and is being rapidly brought into good condition. A lot of Pelargoniums and such general market plants are contained in the remainder of the buildings.

(To be continued.)

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

April 11.—Present: Dr. M. T. Masters, F.R.S. (in the chair); Mr. Blandford, Professor Oliver, Mr. Michael, Mr. Wilson, Dr. Bonavia, Sir J. T. D. Llewelyn, Bart., Rev. W. Wilks, and Rev. G. Henslow, Hon. Sec.

Californian Oranges.—Dr. Bonavia showed samples of this newly-imported fruit. They are peculiar in having the rind open above, with a small Orange protruding from the apex. It appears to be an established variety of "carpellary multiplication," though incapable of propagation by seed, as these Oranges are seedless. It is of common occurrence in the variety called "Mellarose"—(*Teratology*, by Dr. M. T. Masters, p. 134).

Gentiana acaulis.—Mr. Wilson exhibited about a dozen flowers of this plant, showing variations in the colour, from lavender to the deepest blue. Mr. Michael remarked that he had noticed very many about 2000 feet above Innspruck, of the pale blue variety, the pink-coloured variety being rare. Mr. Wilson's were specimens cultivated at Weybridge and Wisley.

Oxlip, var.—Dr. Masters exhibited an umbel of the true Bardfield yellow Oxlip, P. elatior, which is rare in Britain; and a reddish-flowered variety, from a clump originally introduced into his garden two years ago, together with the former, which has hitherto borne only yellow flowers.

Grammatophyllum with spinescent Roots.—He also showed a specimen of the roots of this Orchid, remarkable for their erect or ascending, much-branching character, the longer roots being covered with short spinescent branches half an inch in length. The thicker roots penetrated into decayed vegetable matter, developing absorbent root-hairs, confirming the suggestion of Professor F. Oliver that the peculiar development was an adaptation to saprophytism. The secretary suggests that the short spiny lateral roots may be arrested conditions, in consequence of their not having been buried in any nourishing material.

Acacia Galls.—Remarkable specimens were received from Baron von Mueller from Australia. They were referred to Mr. Blandford for examination.

Richardia, Monstrous.—Mr. Sheppard, of The Toddington Orchard Company, sent a specimen, one leaf of which was white like a true spathe. In another case there was a small supplementary spathe and spadix springing from the axil of a second spathe. Dr. Masters observed that if this could be perpetuated, there might be a succession of bloom from the same stalk.

April 25.—On Tuesday last was the annual show of the Auricula Society, in connection with the meeting at the Drill Hall, James Street, Westminster. Full particulars of which will be found below. There was also a very good display of flowers in season, including some first-rate Roses, several exhibits of Narcissus, and the usual amount of Orchids. The Hall was well filled with exhibits, and the number of visitors was exceptional, but no new plants of any great importance were presented.

Floral Committee.

Present: G. Paul, Esq., in the chair; and Messrs. H. Correvon, H. Herbst, T. H. Fitt, H. May, G. Stevens, G. Gordon, J. Jennings, C. E. Pearson, W. Furze, C. E. Shea, J. W. Pawle, P. Barr, T. Baines, C. Noble, J. Walker, J. Fraser, and W. Watson.

A very fine group of pot Roses were sent by Messrs. Wm. Paul & Son, Waltham Cross, Herts. The blooms were very good for the date of season, and, indeed, the Roses from these and other exhibitors far surpassed any that we saw at the great Ghent show the week previous. Noticeable amongst those from Messrs. Wm. Paul & Son were Jeannie Dickson, Violette Bouyer, Duke of Albany, Duke of Teck, La France, Duke of Wellington, &c. Of the Polyantha section was the fine Claire Jacquier, which has a lovely bronze tint when in the bud, and the Moss group was represented by Zenobia (Silver-gilt Flora Medal).

Messrs. Paul & Son, Old Nurseries, Cheshunt, had also a nice group of pot Roses, including good specimens of Baron N. de Rothschild, Magna Charta, and Marie Van Houtte; also a pretty collection of alpines, amongst which the following were the most noticeable. Phlox nivalis frondosa, the delicately pretty P. canadensis, P. amœna, and P. Nelsonii, Iris nudicaulis, Adonis vernalis, Primula cortusoides, Ranunculus monspeliacus R. amplexicaulis, &c. (Silver Banksian Medal).

Another group of Roses came from Mr. Wm. Rumsey, Joyning's Nursery, Waltham Cross. These were also of very good quality, especially Earl of Dufferin, Suzanne-Marie Rodocanachi, Eclair, Baroness Rothschild, and the pretty Tea Souvenir d'un Ami, &c. Mr. Rumsey also staged a good number of excellent blooms of Niphetos, and a few other miscellaneous (Silver Flora Medal).

Mr. Frank Cant, Colchester, had another such exhibit of cut Roses as he staged at the last meeting, but of even better quality than those (Silver Banksian Medal).

Mr. J. Walker, nurseryman, Thame, Oxon, had some boxes of Daphne Cneorum major, and some nice plants of Fabiana imbricata in pots; also a good number of cut blooms of Maréchal Niel Rose, and some bright trusses of Zonal Pelargoniums (Silver Banksian Medal).

Messrs. B. S. Williams & Son, Upper Holloway, London, staged a very similar group to that they had on the last occasion, including some good Amaryllis, Anthuriums, &c., and two large plants of Rhododendron Aucklandii (Silver Banksian Medal).

A pretty group of miscellaneous plants was that from Messrs. E. D. Shuttleworth & Co., Ltd., and included Azaleas in flower, Dracænas, Caladiums, Palms, and a few Orchids, Ferns, Hydrangeas, &c.; also some seedling Auriculas (Silver Banksian Medal).

J. C. Tasker, Esq., Middleton Hall, Brentwood (gr., Mr. Perry), had a group of well-grown large specimen Cannas, the varieties were Edward André, Victor Hugo, Madame Crozy, Progression, Antoine Chaubin, Louis Thibaut, and Admiral Field (Silver Banksian Medal). Also a group of Roses in pots, nicely flowered (Bronze Banksian Medal).

Mr. Thos. S. Ware, Hale Farm Nurseries, Tottenham, staged a very attractive group of Primula Sieboldii in many varieties. Some of the more pleasing were Miss N. Barnard, rose-coloured, with fimbriated margin. Rosea striata, Ruby, Victor, a large rose-coloured variety; Novelty, exceeding pale lilac; Dora and Violacea maxima (Bronze Banksian Medal).

Messrs. John Peed & Sons, Norwood Road, had a group of Gloxinias and Ferns (Bronze Banksian Medal).

Messrs. Wm. Cutbush & Son, Highgate, London, N., had some Daphne Cneorum, some plants of Lunaria biennis variegata, Calla Little Gem, and Leschenaultia biloba major, for which they were accorded a Vote of Thanks.

Messrs. B. S. Williams & Son received an Award of Merit for Abutilon Souvenir de Bonii, a very graceful prettily variegated variety. They also staged Calla aurata, Amaryllis Mrs. Carter, and Azalea de Schyneriana, a double one, after the style of Prince Albert. A First-class Certificate was awarded to Strobilanthes Dyerianus, exhibited by Messrs. Jas. Veitch & Son, Chelsea. The plant was described on p. 442, in our issue for April 15.

Mr. James O'Brien, Harrow-on-the-Hill, sent blooms of Cyrtanthus carneus, of orange-scarlet. Mr. A. Smith, Prospect House, Downley, High Wycombe, received a Vote of Thanks for a large collection of cut Roses, and some blooms of Violas.

Mr. F. Bullen, Hither Green, Lewisham, Kent, staged a group of Callas to be named, some of which were Calla Little Gem. A very fine yellow form, believed to be the Calla Pentlandii, but upon which many doubts were expressed, was left unnamed. It differed from previously exhibited plants of C. Pentlandii in that it was of considerably dwarfer habit, and the colour of spathe a more decided yellow. Absence of heat, and better culture may, however, account for this difference.

A group of Calceolarias were from J. James & Son, Woodside, Farnham Royal, Slough. These were in the first-class form peculiar to the firm. The plants were dwarf, flowers large, and colours bright, spotted and mottled varieties were included, and others were of the purest and most decided colour (Silver Banksian Medal).

A large and very interesting collection of alpines were sent by the Guildford Hardy Plant Nursery Co., Mill Mead, Guildford. These were arranged in baskets, and included amongst many others, Cypripedium pubescens, Ramondia pyrenaica, Gentiana acaulis, Aubrietia tauricola, Phlox in several varieties, Iberis jucunda, Adonis pyrenaica, Dracocephalum grandiflorum, several Ranunculuses, Trollius napellifolius, &c. (Silver Banksian Medal).

Some cut blooms of Anemone Aldboroughensis were from Messrs. Jas. Veitch & Sons, and some blooms of Cinerarias from Mr. Henry Eckford, Wem, Salop.

Messrs. H. Lane & Son, Berkhamstead, showed several kinds of Ghent Azaleas, and varieties of Azalea mollis, Azalea Raphael de Smet, a beautiful pink flower, double, gained an Award of Merit; as did also a variety of Azalea mollis called Hilda, a pretty orange-scarlet flower. Many other varieties shown included some very beautiful shades of colour. C. E. Smith, Esq., Silvermere, Cobham (gr., Mr. J. Quartermann), had a lot of very well-flowered sprays and plants of Deutzia crenata fl.-pl.

A showy group of Tulips, Narcissus, &c., came from Messrs. P. Barr & Sons, King Street, W.C.; the former consisted of a few species and varieties, and the latter of cross-bred Narcissus chiefly, as N. Leedsi, N. Burbidgei, N. Barri, and N. incomparabilis varieties, very nice, pretty-looking, and fresh (Silver Banksian Medal).

Mr. G. H. Cammell, Heathersage, Sheffield, showed an interesting collection of varieties, somewhat similar to the first-named, and with as many new ones. Narcissus came likewise in some quantity from Messrs. E. D. Shuttleworth & Co., Peckham Rye, and in good quality, considering the heat. The group contained several Saxifrages in flower, Lithospermum prostratum, Creeping Phlox, Trillium, Gentian, &c. (Bronze Banksian Medal).

The showiest and choicest lot of Daffodils were those shown by Messrs. J. R. Pearson, The Nurseries, Chilwell, Notts. There were here forms of N. bicolor, N. incomparabilis, N. Burbidgei, N. Nelsoni, N. Leedsi, N. poeticus. We may mention N. poeticus major, N. Nelsoni major, N. incomparabilis Goliath, N. Leedsi Duchess of Brabant, N. poeticus grandiflorum, N. Backhousei Wolley Dod, N. Burbidgei Robin Hood, N. King of the Netherlands, and many another promising variety (Bronze Banksian Medal).

Orchid Committee.

There were present:—H. J. Veitch, Esq., in the chair; and Messrs. J. O'Brien (Sec.), S. Courtauld, T. B. Haywood, F. Sander, J. Jaques, E. Hill, W. H. White, A. H. Smee, R. Brooman-White, H. Ballantine, H. M. Pollett, James Douglas, and C. Pilcher.

Sir Trevor Lawrence, Bart., Burford, Dorking (grower, Mr. W. H. White), staged an effective group of charmingly fresh-looking and well-grown Orchids, to which a Silver Flora Medal was awarded. The specimens consisted of a handsome plant of the crimson-flowered Masdevallia Arminii, with over seventy blooms; an equally handsome M. Gelengiana×, with yellowish rose-tinted flowers; M. caudata Shuttleworthii, and its light variety, xanthocorys, Cattleya Schroderæ, with thirteen flowers; a grand C. Mendelii with fifteen flowers; the pretty and extremely rare Bulbophyllum Sillemianum, B. Lobbii var. siamense, Dendrobium revolutum, a fine D. thyrsiflorum, a large Cypripedium Schroderæ ×,

C. villosum aureum, and a fine plant of Epidendrum atro-purpureum album.

Messrs. F. Sander & Co., St. Albans, exhibited a group of rare and showy Orchids, which secured a Silver Banksian Medal. Noteworthy features in it were the new supposed natural hybrid Odontoglossum Roebelinianum, with wax-like, creamy-white flowers, handsomely spotted with reddish-purple; O. Selwoodense, of the O. mulus class; a fine plant of a very handsome form of Maxillaria Sanderiana, with a clear yellow labellum, and named M. Sanderiana xanthoglossa; the handsome Cattleya Burberryana ×, Lælia Digbyana, Zygopetalum Klabochorum, Cattleya Skinneri alba, Cypripedium Rothschildianum, the large yellow Oncidium roraimense, fine plants of Dendrobium densiflorum, D. chrysotoxum, and plants of their grand strain of Odontoglossum crispum.

Messrs. Jas. Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea, exhibited a striking novelty in hybrid Orchids in Lælio-Cattleya Ascania × (C. Trianæ ♀, L. xanthina ♂), with flowers of true C. labiata form, but rather smaller. The sepals were sulphur-yellow, the broad petals white tinged sulphur-yellow, the lip the same colour, with a rich crimson front lobe. Messrs. Veitch also exhibited their new Lælio-Latona × (cinnabarina ♀, purpurata ♂), which, like most fine hybrids, improves much when grown on. The flowers are rich Indian yellow, the lip marked with bright purple. It was awarded a First-class Certificate in May, 1892.

Thos. Statter, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), showed a small plant of Dendrobium nobile, Statter's var., which bore a few very large flowers. The committee having thought that the plant would come in much better form, requested to see it again. Mr. Statter also showed Cypripedium Measuresianum aureum ×, almost entirely yellow, and C. Boxallii superbum, very well flowered.

C. De B. Crawshay, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cook), showed five of the finest forms of Odontoglossum crispum we have as yet observed together, the large clear white and the rose-tinted ones being especially good. One very richly spotted rose-tinted variety was only just opening its blooms, and will probably be shown again.

C. Winn, Esq., The Uplands, Selly Hill, Birmingham, showed Dendrobium Nestor × (superbum var. ♀, Parishii ♂), with pretty purplish rose flowers.

W. W. Mann, Esq., Ravenswood, Bexley, exhibited a fine plant of Cycnoches pentadactylon, with a spike of male flowers and one female. Both forms of flowers have been illustrated in the *Gardeners' Chronicle*.

Mr. Wm. Whiteley, Whiteley's Nursery, Hillingdon, near Uxbridge (manager, Mr. G. Bethell), showed Odontoglossum excellens, Whiteley's var., a fine clear yellow form, with large reddish chestnut-coloured blotches, and a very ample and well-formed labellum.

Messrs. Hugh Low & Co., The Nurseries, Clapton, staged a group of Orchids, in which the fine new Stanhopea Amesiana was a remarkable feature. It belongs to the S. ecornuta and S. Lowii class, and has large wax-like, clear white, fragrant flowers; the lip is very thick and fleshy, and is destitute of the horns seen in most of the Stanhopeas. Cypripedium Mastersianum was another distinct plant in this group, and the other Cypripediums, Dendrobiums, Phalænopsis, &c., were excellent.

Messrs. W. L. Lewis & Co., Southgate, had a group of showy Orchids, comprising Lælia Boothiana, Odontoglossum triumphans pallens, some Cattleya Mendelii and other Cattleyas, several Oncidium ampliatum majus, Odontoglossoms, Cypripediums, &c.

Messrs. Seeger & Tropp, Lordship Lane, East Dulwich, showed the curious hairy-lipped Lycaste lasioglossa. E. G. Wrigley, Esq., Victoria House, Dunkinfield, Cheshire (gr., Mr. C. Harris), showed Dendrobium nobile albiflorum, D. n. Victoriense, which was like a larger form of the D. n. albiflorum, Sophronitis grandiflora, and Cattleya citrina. C. E. Goodheart, Esq., Langley Park, Beckenham (gr., Mr. R. Padbury), showed Cypripedium caudatum Wallisii. Messrs. Condor & Raphael, Hazlewood, Kings Langley (grower, Mr. E. Day), sent Dendrobium amœnum, and three plants of Cypripedium niveum. J. G. Luytwych, Esq., Oakfield, Beckenham, sent Cattleya Luddemanniana.

Earl Cowper, Panshanger House, Hertford (gr., Mr. J. Fitt), showed a curious Odontoglossum, probably a form of O. mulus, and some varieties of Cypripedium barbatum.

F. W. Moore, Esq., curator, Royal Botanic Gardens, Glasnevin, Dublin, sent a spike of the curious coppery-yellow Saccolabium cerinum. Reginald Young, Esq., Fringilla, Sefton Park, Liverpool, showed cut flowers of two fine and dissimilar forms of Maxillaria Sanderiana, the almost white Vanda teres Auroræ, and other Orchids; and Walter C. Clark, Esq., Orleans House, Aigburth Drive, Sefton Park, Liverpool, flowers of Phaius Cooksonii ×.

Orchid Committee Awards.

First-class Certificates.

To Masdevallia Gelengiana ×, from Sir Trevor Lawrence.

To Masdevallia Arminii, from Sir Trevor Lawrence.

To Lælio-Cattleya Ascania ×, from Messrs. Jas. Veitch & Sons.

Awards of Merit.

To Odontoglossum Roebelinianum, from Messrs. F. Sander & Co.

To Maxillaria Sanderiana xanthoglossa, from Messrs. F. Sander & Co.

To Epidendrum atro-purpureum album, from Sir Trevor Lawrence.

To Stanhopea Amesiana, from Messrs. Hugh Low & Co.

Botanical Certificates.

To Saccolabium cerinum, from Mr. F. W. Moore, Glasnevin, Dublin.

To Bulbophyllum Lobbii siamense, from Sir Trevor Lawrence.

Medals.

Silver Flora.

To Sir Trevor Lawrence, for a group of Orchids.

Silver Banksian.

To Messrs. F. Sander & Co., for a group of Orchids.

Vote of Thanks.

To Messrs. W. L. Lewis & Co., for a group of Orchids.

To Messrs. Hugh Low & Co., for a group of Orchids.

Fruit Committee.

Present: Philip Crowley, Esq., in the chair; and Messrs. Harrison Weir, H. J. Pearson, P. C. M. Veitch, J. Cheal, G. W. Cummings, W. Wilks, G. T. Miles, G. Taber, T. J. Saltmarsh, J. Wright, A. Dean, J. Willard, G. H. Sage, G. Wythes, J. Hudson, H. Balderson, J. Smith, F. Q. Lane, and A. Moss.

Mr. Geo. Wythes, gr. to the Duke of Northumberland, Syon House, Brentford, exhibited twenty Peaches—Amsden June, which was awarded an Award of Merit in May of last year. On this occasion they were shown for Certificate, but the committee do not grant this to any clingstone variety. The tree from which these fruits were gathered was planted on November 26, 1890, and in May last year it yielded seven dozen fruits, whilst this year it has given nine dozen. The first fruits were gathered on April 12, and it is said to be much earlier than Hale's Early. The same exhibitor obtained an Award of Merit for Potato Sharpe's Victory, a roundish kidney, smooth, small eyed, and said to be a first-rate early cropping variety. Also two bundles of Asparagus Connover's Colossal.

Mr. Owen Thomas, The Royal Gardens, Windsor, sent six seedling Melons, obtained from Countess × Royal Ascot. Also a box of fine Strawberries La Grosse Sucrée, and Tomatos Brown's Invincible. Strawberries were also exhibited by Messrs. Jas. Veitch & Sons, Chelsea, Empress of India, Lord Suffield, and Gunton Park. This latter was very large, but the flavour was not extra good.

Mr. J. Miller, gr. to Lord Foley, Ruxley Lodge, Esher, sent Strawberries Bicton Pine and Keen's Seedling. W. A. Wykeham-Musgrave, Esq., Thame Park, Thame (gr., C. C. Munday), sent a seedling Strawberry Early Prolific. The flavour was medium, but it did not obtain an award.

A seedling Melon Hamilton Defiance was from W. R. Inglis, Esq., Craigendowie, Reigate Hill (gr., Mr. Geo. Smith). This likewise was unsuccessful.

A collection of Apples was staged by Mr. J. G. Dear, Titsey Park Garden, Limpsfield, Surrey, to show their late-keeping qualities. Those appearing in best condition were Scarlet Nonpareil, Boston Russet, Cox's Orange Pippin, Sturmer Pippin, Kentish Fillbasket, Annie Elizabeth, Cornish Aromatica, Northern Spy, and Northern Greening (Vote of Thanks).

Lecture on Alpine Plants.

In the afternoon a lecture on "Alpine Plants," by M. Henri Correvon, of the Jardin d'Acclimatation, Geneva, was read by the secretary. The lecturer commenced by describing the distinct character of the plants inhabiting the Alps and other high altitudes, referring to the gradual diminution in the size of plants, until at an altitude of 6000 feet, the whole of the plants become dwarf and stubby. Even the genera which are represented in the lowlands by large trees and shrubs, are reduced to the same dwarf character upon these heights. Most of them are perennials, and a great proportion are stoloniferous. The colours of the flowers are vivid, and owing to the amount of sunshine and air, there is an absence of all fungi. The leaves are differently constructed also from those of plants in the plains, through the action of the sun; the leaves become thick and of strong texture, and consequently the better able to withstand the drying effects of the summer. They are often pubescent also, and almost all of them have coriaceous leaves, and these act in the same manner. From the different character of the cells in the leaves also, which are small and admit of little water to be retained, the plants are enabled to bear the constant freezing and thawing to which they are subjected. The frost also has influence in rendering the plants dwarf, which is explained by the knowledge that elongation mostly takes place in plants during the night, and the frost which obtains during that time upon the heights, prevents the internodes from becoming lengthened. This also explains the fact that these same plants when brought to the plains become more elongated. M. Correvon said that in Geneva they could not produce such large and vigorous alpine plants as could be seen in England, but the colours were more vivid, and the stems were more dwarf. Thus, in Geneva the plants preserved their original character more than was the case in England. Through the lack of humidity in the atmosphere in Geneva, it was impossible to succeed with a large number of the species. The lecturer then went on to speak as to the conditions which alpine plants enjoyed naturally, referring to the small amount of heat which was necessary to start them into growth, and to the intense rays of the sun, which reach them in summer, rendered more searching through the less dense character of the atmosphere at such an altitude. As soon as the snow disappears, the plants are at once subjected to intense sunlight, and experiencing no spring, they enter at once into summer. Another condition of growth that the lecturer laid great emphasis upon was, the presence of vapour in the atmosphere and around the plants. It was the presence of this vapour in abundance at high altitudes which constituted one of the protections the plants had from burning by the sun; but there was not so much humidity in the atmosphere towards autumn when the seeds were ripening, and this was of importance in the maturation of the seed. Just before the winter sets in, the plants make a last effort of growth, and the earlier spring-flowering ones formed their buds for the following spring. The humidity is explained by the rocks becoming saturated with moisture during the season of snow, and this is given off as the dryness of the atmosphere compels it, and towards the end of the season most of this has been given off, consequently the air becomes dryer. M. Correvon then described the best means he had found for supplying an equivalent to the aqueous condition under which they grow naturally. This was by growing the more difficult ones in sphagnum, a method which the lecturer has already recommended in these columns.

The manner of increasing alpine plants was next treated upon, and for general purposes, M. Correvon strongly advised that they be increased by seed, and gave useful particulars relating thereto; also directions for propagating by division, and other methods, some few which it was found impracticable to raise from seed. The lecturer forcibly deprecated the removal of plants from the Alps and other habitats in order to increase them, or to plant them again in the lowlands, giving several instances in which the flora of particular places had been damaged, and individual species entirely taken therefrom. All plant collectors should, instead of rooting up the specimens they wish to cultivate from their native habitats, increase them by seed, cuttings, or division. After the lecture several questions were asked the lecturer by members, and these were courteously answered.

NATIONAL AURICULA AND PRIMULA SOCIETY.

April 25.—The annual exhibition of this Society was held in connection with the meeting of the Royal Horticultural Society on the above date, and though a goodly number of Auriculas of all types were staged, there were traces in most cases of the unusual warmth and dryness of the month. Even those from northern growers showed these effects. Notwithstanding these drawbacks, five collections of twelve dissimilar show Auriculas were staged. The Rev. F. D. Horner, Low Fells, Burton-in-Lonsdale, taking the 1st prize with green edge, Achilles, Shirley Hibberd, a very fine dark green edge, black body colour, excellent paste and golden tube, the

zones of colour being well contrasted; Monarch, in fairly good character, but weak in the tube as shown; and Chloe, bright green edge, dark body colour, good tube, but paste somewhat thin and narrow. Grey edges, George Lightbody, very good, and Alexander Meiklejohn, with eight fine pips; white edges, Magpie and Heatherbell; selfs, Doris, shaded plum colour, the shading being occasioned apparently by the heat, good tube, but somewhat narrow paste, rather scolloped, apparently a seedling from Mrs. Potts; Dusk, a very dark self, good tube, but with the usual narrow paste; and Charmer, a bright red self, fine shape, and promising.

There were five stands of six Auriculas, and the Rev. D. Horner was again 1st, with green edge, The Rev. F. D. Horner; grey edge, Grayling, a large flower, good tube, narrow dense paste, slight dark body colour, and broad edge; and Alexander Meiklejohn, in good character; white edges, Magpie, with six charming pips, and Rachel; self, Mrs. Potts.

Three collections of four Auriculas were staged, W. Smith, Esq., The Links, Bishops Stortford, was 1st, with green edge, The Rev. F. D. Horner; grey edge, George Lightbody; white edge, Mrs. Dodwell, and self, Mrs. Potts.

There were four stands of two Auriculas. Mr. L. Brown was 1st, with white edges, Rachael and Mrs. Dodwell.

In the classes for specimens, the best green edge were:—1st, The Rev. F. D. Horner, shown by Mr. Horner.

Of grey edges, the best was George Lightbody, shown by the Rev. D. F. Horner.

The best white edge was Magpie, from the Rev.F.D. Horner.

The best self was Black Bess, Mr. W. Smith being placed 1st and 2nd with this variety.

There were five exhibitors of fifty Auriculas, but with the exception of the 1st, which was rich in good alpines, the others were of poor quality. Mr. C. Turner, Royal Nurseries, Slough, was placed 1st with such show varieties as Lancashire Hero, Alexander Mecklejohn, Sir J. Moore, and William Brockbank among greys; Mrs. Dodwell, white edge, and Mrs. Potts, self; and of alpines, Grace Darling, C. Phillips, Mrs. H. Turner, Winnifred, International, Edith Wynne, Mabel, Jeannette, &c., with unnamed seedlings.

Alpine Auriculas.—The alpine Auriculas, like the others, lacked brightness. Mr. C. Turner, for twelve plants, had an easy victory with a very good lot of plants, having, of golden centres, F. Knighton, Dash, Charles Turner (very bright), and Hotspur; of cream and white centres, Mrs. H. Turner, Roland, Winnifred (a charming variety), Patience (very good), Countess, Hubert, and Seedling. Mr. C. Phillips was 1st for six plants, having all named seedlings of his own of good quality, viz., Saturn, Mrs. Martin, Mrs. F. J. Blandy, Baroness Burdett Coutts, Mr. G. W. Palmer, and Mr. F. Barrett.

For specimen Alpines, the best gold centre was H. M. Pollett, from Mr. C. Turner, a flower of promise; centre, 1st, Mr. C. Turner, with Lady Laura Hampton, the marginal colours being dark shading to bluish-purple.

Polyanthus, gold-laced.—These, as might have been expected, were sparingly shown. Mr. J. Weston, Ravensholme, Balham, was 1st, with George IV., Napoleon, John Bright, Lancashire Hero, Cheshire Favourite, and Lancer; well grown and flowered, but lacking in quality.

With three plants, Mr. A. J. Sanders was 1st, having Napoleon, John Bright, and William IV.

The best specimen was George IV., from Mr. Patterson; and Mr. A. J. Sanders was 2nd, with Napoleon.

Fancy Polyanthus.—These were not up to their usual mark, owing to the weather. The best twelve specimens came from Mr. J. Douglas.

Primroses.—Mr. Douglas also took the 1st prize with twelve bright-looking plants; Mr. R. Dean was 2nd. Mr. Douglas was also 1st with a basket of Primroses, though all plants staged were fancy Polyanthus. This was a departure from the custom which has hitherto prevailed, Primroses in the schedule being differentiated from Polyanthus. Probably the judges, whoever they were, did not understand the difference between the two.

Fancy Auriculas.—As it is extremely difficult to define what is a Fancy Auricula, except by stating the broad ground that it is a variety which cannot be classified in any known section, it is simply necessary to record that Mr. J. Douglas was 1st with twelve plants. Some of Mr. Douglas's varieties were curious and distinct.

Species of Primulas.—Owing to the heat, these were not shown so largely or so well as in previous years. The only twelve specimens staged came from the Hardy Plant Nursery Co., Guildford, who had somewhat sorry specimens of Poissoni, japonica alba farinosa, Balbisii (?), floribunda, sibirica, Bellunensis intermedia, Murettiana, rosea, ciliata, and Auricula marginata. The only collection of six came from Mr. J. Douglas, who had as usual finely grown and well-flowered examples of Sieboldi laciniata, Japonica, luteola, verticillata, intermedia, and obconica.

Premier Auricula.—The variety selected for this distinction was green edge Shirley Hibberd, shown by the Rev. F. D. Horner in his first prize collection of twelve plants, and it was also awarded the special prize offered by Mr. W. Smith, for the best seedling green edge showing an improvement upon existing varieties.

Seedling Auriculas.—Prizes were offered for seedlings of each of the sections; but no green edge or grey-edged flowers were staged. One white edge, Desdemona was staged by the Rev. F. D. Horner, but no award was made. A 1st prize was awarded to Engineer, a dark self, raised and shown by Mr. A. J. Sanders—in the way of Black Bess, but with a broader paste. Of gold-centred Alpines, Mr. C. Turner staged two, and was awarded a 1st prize for F. Knighton, black shading to deep salmon, very fine. With white-centred flowers, Mr. C. Turner was placed 1st, having Winnifred, the dark ground shading to bright lilac-mauve, very pretty.

ROYAL BOTANIC.

April 26.—The second spring show of this Society was held, under the most favourable conditions, in the houses at Regent's Park, on Wednesday last. Upon the whole, the exhibits were quite up to the average, and, thanks to the miscellaneous groups contributed by the various nurserymen, there was a bright and interesting display. In the competitive classes, however, there were but few entries, and in so important a class as a collection of hardy herbaceous plants, and some others, only one exhibit had been entered; the work of the judges, therefore, was extremely light. We have but little space, and can only refer to some of the more important exhibits.

For a collection of alpines in flower, grown in pots, there were two competitors, the 1st prize going to Messrs. Paul & Son, The Old Nurseries, Cheshunt, who had a good collection of the better-known kinds.

For six Imantophyllums, Mr. R. Scott, gr. to Miss Foster, The Holmes, Regent's Park, was 1st, and he was the only exhibitor of twelve plants of Dielytra spectabilis.

For plants of Amaryllis, Mr. J. Douglas, gr. to Mrs. Whitbourne, Great Gearies, Ilford, was the only exhibitor.

Mr. Thos. S. Ware, Hale Farm Nurseries, Tottenham, showed twelve plants of Begonias of very good merit, especially for the early season. The same exhibitor was 1st for twelve Primula Sieboldi. They were in small pots, plunged in pans, and were shown in good condition. Ware's White is a very pretty variety.

Mr. Jas. Douglas was the only exhibitor of nine Cinerarias. The plants carried plenty of flower, but lacked a dwarf and neat habit.

Messrs. Paul & Sons, Old Nurseries, Cheshunt, were 1st for six Roses in pots. All the plants were in large pots, and were some 4 feet or more through.

The six greenhouse Azaleas that obtained 1st prize for Mr. Scott, were of medium size, and well-flowered; and those of Mr. A. Eason, gr. to B. Noakes, Esq., Hope Cottage, Highgate, were larger, but not so well-flowered.

What should have been an interesting class, a collection of hardy herbaceous plants, was only entered by one exhibitor, Mr. Thos. S. Ware, of Tottenham; but the exceptional character of the weather has made it difficult for growers of these plants to get a collection together. The group was of good merit, under the circumstances, and included some interesting specimens.

The 1st prize for twelve alpine Auriculas was secured by Mr. Chas. Turner, Slough.

Mr. James Douglas was 1st for twelve distinct Auriculas.

The Mignonette was not extra good, the 1st prize going to Mr. W. Morle, 162, Fenchurch Street, E.C.

Miscellaneous groups were numerous, and added very considerably to the appearance of the whole. It was a very fine group of Begonias that Mr. T. S. Ware staged, along with some Ferns, Palms, &c., and which gained a Silver Medal. One very bright little scarlet double variety called Miss Jennie Fell was given a Floral Certificate, also Lord Byron, a single flower with white centre, and margins of deep rose.

Messrs. Wm. Paul & Son, Waltham Cross, Herts, had a very large and meritorious collection of Roses in pots, one of the chief attractions of the show, and was awarded a Large Silver Medal.

Another good group of Roses was from Messrs. Paul & Son, Old Nurseries, Cheshunt (Small Silver Medal).

Mr. P. Perry, gr. to J. C. Tasker, Esq., Middleton Hall, Brentwood, had also a group of pot Roses, and the Cannas that were noticed at the Drill Hall on the previous day.

Messrs. J. Peed & Son, for a group of miscellaneous plants similar to that put up by them at the Drill Hall were awarded a Silver Medal.

Another fine group of plants was staged by Messrs. Jno. Laing & Son, Forest Hill. Caladium Louis A. van Houtte, a dull red broad-leaved variety, was granted a Certificate.

Messrs. James & Son, Farnham Royal, had an excellent group of Calceolarias (Small Silver Medal).

Messrs. Wm. Cutbush & Son staged the Calla Little Gem, Abutilon, and Leschenaultia, &c., that were noticed at the Drill Hall.

Messrs. Jas. Veitch & Son, Chelsea, had a magnificent group of plants, containing fine specimens of Spiræa astilboides, S. confusa, Lilium longiflorum, the dwarf Rhododendron rosæflora, Vitis heterophylla variegata, the pretty Azalea Anthony Koster, and many other interesting plants (Large Silver Medal). They were also awarded a Botanical Certificate for Lælia Latona and Lælio-Cattleya Ascania, and a Floral Certificate for Rhododendron Lord Wolseley. Strobilanthes Dyerianus and Vriesia Morrenii also obtained Botanical Certificates. Notice of most of these plants was made in the report of the Royal Horticultural Society on Tuesday last.

A very gay group of hard-wooded plants in flower was staged by Messrs. Hugh Low & Co., Clapton and Enfield.

Messrs. H. Lane & Son, Berkhamsted, showed the same Azaleas that were exhibited at the Drill Hall, and a Floral Certificate was awarded to A. pontica, Raphael de Smet (Bronze Medal).

For a group of Tree Pæonies, Mr. Thos. S. Ware was awarded a Silver Medal; and Mr. Charles Turner, Slough, a large Bronze Medal for a group of Show and Alpine Auriculas.

Carnation Uriah Pike, a good deep scarlet Clove, shown by Mr. J. Pike, 66, Park Road, South Acton, obtained a Floral Certificate.

Several very pretty groups of Primulaceous plants were shown by Mr. Jas. Douglas, who was recommended a small Silver Medal.

Messrs. Barr & Sons, Covent Garden, had a large group of Narcissus and other hardy cut flowers (large Bronze Medal); also another Bronze Medal for a pretty collection of mixed Tulips and for a collection of herbaceous and alpine plants. Mr. John Walker, Thame, Oxon, showed a number of cut blooms of Maréchal Niel, and some Zonale Pelargoniums (Bronze Medal). A group of pot Roses and a number of good cut blossoms of Niphetos and a few others were put up by Mr. Wm. Rumsey, Joyning's Nurseries, Waltham Cross (Silver Medal). Mr. Arthur Knowles, Horsell Birch Nursery, Woking Station, showed a quantity of Daphne Cneorum major in pots in good condition (Bronze Medal).

EDINBURGH ROYAL BOTANICAL.

April 13.—The Society met in the rooms at No. 5, St. Andrew Square, Dr. David Christison, President, in the chair.

The Curator exhibited from the Royal Botanic Garden, flowering plants of Cassiope fastigiata and Xerophyllum asphodeloides in pots. Mr. Campbell sent cut twigs of Erica carnea, Escallonia macrantha, &c., from plants growing in the open air in his garden at Ledaig, Argyllshire. Professor Somerville, of Newcastle, exhibited a specimen of Cordyceps militaris, a fungus which attacks insect larvæ, the present example having been found in Northumber-

land. Professor Bayley Balfour exhibited a number of Tulip bulbs infected with Sclerotium Tulasnii from Kew.

The President exhibited a drawing of the Ash tree at the Boat-of-Logierait, Perthshire. This tree is referred to in the Scottish Statistical Account as being 50 to 60 feet high, and having a girth of 30 feet at 5 feet from the ground. It has, however, suffered severely from the ravages of the weather, and is now not more than 20 feet high, while half of the bole has disappeared; but the part which remains has a diameter of 9 feet at 6 feet from the ground, and of 7 feet 9 inches at a height of 11 feet.

Mr. Forgan exhibited a large swelling on a root of Cupressus Lawsoniana, the formation of which was probably due to the plant having been grown in a pot.

Professor Bayley Balfour read a communication on the genus Latania and some other genera of Mascarene Palms, six of which are peculiar to the Seychelles, and are quite distinct, though often referred by gardeners and others to the old genus Areca, and in various ways confused with other Palms. Professor Bayley Balfour mentioned that many of these Palms are when still young covered with long sharp spines, but become quite smooth as they increase in size. The paper was illustrated by a number of specimens of the Palms mentioned from the Royal Botanic Garden, as well as by lime-light views of them in their native haunts.

Mr. T. D. Sadler read a paper dealing with the morphology and internal anatomy of the Butterwort, Pinguicula vulgaris, one of our common insectivorous plants.

Professor Bayley Balfour communicated a short note on the development of the Pomegranate, the subject being illustrated by means of the optical lantern.

The Curator read the following report on the temperature and vegetation at the Royal Botanic Garden during March:—The thermometer was at or below the freezing point on fifteen mornings. The total amount of frost registered for the month was 64°, as against 156° for the corresponding month last year. The lowest temperatures were indicated on the mornings of the 17th, 27°; 18th, 23°; 19th, 21°; 21st, 26°; 22nd, 26°. The day temperatures were high, the lowest being 40° on the 1st, and the highest 69° on the 25th. Slight rain fell on four days only, and snow on three days. There was a large amount of bright sunshine, and on the whole, the month was a most favourable one. Vegetation generally has made good progress. The leaf-buds of deciduous trees and shrubs are well forward, and only require some genial showers to enable them to expand. The different varieties of flowering Currant are in full blossom. Rhododendron Nobleanum was flowering most profusely till injured by frost on the 19th. Of the forty spring-flowering plants whose dates of flowering are annually recorded, the following twenty came into flower during March, viz., Orobus vernus on the 2nd; Sisyrinchium grandiflorum, 2nd; Arabis albida, 3rd; Iris reticulata, 3rd; Sisyrinchium grandiflorum album, 5th; Scilla bifolia, 6th; S. bifolia alba, 7th; S. taurica, 7th; Narcissus pumilus, 10th; Erythronium dens-canis, 13th; Adonis vernalis, 13th; Draba aizoides, 13th; Omphalodes verna, 15th; Ribes sanguineum, 17th; Hyoscyamus Scopolia, 18th; Aubrietia grandiflora, 20th; Narcissus Pseudo-Narcissus, 23rd; Corydalis solida, 24th; Symphytum caucasicum, 24th; Mandragora officinalis, 26th. Fritillaria imperialis came into flower on April 3, which completes the list much earlier than usual. On the rock garden eighty-one species and varieties came into flower.

NEWCASTLE-ON-TYNE BOTANICAL AND HORTICULTURAL.

April 19 and 20.—The lower part of the Town Hall was filled with collections of spring-flowering plants, well grown and effectively arranged. The Hyacinths, Tulips, and Narcissus, considering the warm character of the weather, were in very fair condition. Mr. W. J. Watson, of Town Hall Buildings, won the 1st prize, in a good competition, for twenty-four plants; but he was beaten in the class for twelve plants by Messrs. John Hood & Co., 109, Elswick Road, also of Newcastle.

In the gardeners' class for Hyacinths, Mr. Geo. McDougal, gr. to Howard Pease, Esq., Arcot Hall, Dudley, R. S. O., showed the best plants; the yellow-flowered varieties were very good, and some spikes of Vurbaak were remarkable for their length and high finish. La Grandesse and Mont Blanc were the best white varieties, King of the Blues, Czar Peter, and Lord Derby the best blues, and Koh-i-Noor, Macaulay, and Von Schiller the best red-coloured varieties.

The date of the exhibition exactly suited the Auriculas, and it is doubtful if these lovely spring flowers were ever better shown at Newcastle. The leading exhibitor was Mr. Robert Paterson, gr. to Mrs. Backhouse, Ashburne Gardens, Sunderland, who exhibited in the eight classes set apart for show Auriculas, and won 1st prizes in each. Nearly all the best varieties were represented, and such late-flowering sorts as Mrs. Potts, George Lightbody, Richard Headley, &c., were fully in flower. The gold-laced Polyanthuses were in capital condition, but not much progress seems to be made in the raising of new varieties; the same old sorts are exhibited year after year, viz., George IV., William IV., Cheshire Favourite, Kingfisher, but two very uncommon sorts, Nicholson's King and Pearson's Alexander were staged this year.

Mr. Joseph Ellison, 26, Shankhouse, Cramlington, won all the 1st prizes, including that for the best seedling. Remarkably fine Lily of the Valley was exhibited, and Mr. W. J. Watson had this year to give place to Mr. W. R. Armstrong, of Benwell, the 1st prize plants being truly handsome.

Stove and greenhouse plants are generally well shown at these spring exhibitions. The spring-flowering Rhododendrons of the Countess of Haddington type were present in large well-flowered specimens. In the 1st prize collection from Mr. Neil Black, gr. to the Misses Pease, Southend, Darlington, was a very handsome specimen of this Rhododendron, and a large well-bloomed Vanda suavis. Prizes are also offered for three Orchids, and the 1st prize group contained very well-bloomed plants of Cymbidium Lowianum, Dendrobiums Dalhousianum and densiflorum. It was sent by Mr. Jas. Wood, gr. to Colonel Angus, Fenham Hall, Newcastle. The stands of Roses comprised some splendid blooms of Maréchal Niel. The best were from Mr. Alexander J. Badenoch, Ponteland, Newcastle. There were no fewer than eighty-one classes, and fifty-eight exhibitors; one gardener showing in no less than twenty-six classes, another in twenty-four, which gives some idea of the extent of the exhibition; the classes being well filled, and the competition in some classes very close. Mr. J. McIntyre, gr. to Mrs. J. Pease, Woodside, Darlington, had the best Azaleas. Mr. J. Smith, gr. to Thos. Lange, Esq., Gateshead, had the best Palm. Mr. McIntyre the best Dielytra spectabilis, a graceful group.

Mr. Punton, gr. to T. Hodgkin, Esq., Benwell Dene, was to the fore with Deutzias; and Mr. J. Charlton, gr. to U. A. Ritson, Esq., 1, Jesmond Gardens, won the 1st prize in a good competition for Spiræas. Show Pansies were very good, but the Fancy type far surpassed them. Mr. J. Gardner, Newby Cottage, Whickham, had the best Fancies; and Mr. T. Oliphant was 1st with the show varieties.

A long table in the concert room upstairs was set apart for the cut flowers and table decorations. Messrs. Perkins & Sons of Coventry had the best bouquets. Mr. G. Webster, florist, Sunderland, had the best epergne, Orchids and white Lilies being very deftly arranged.

Maréchal Niel Roses were very effective. The leading exhibits are enumerated above, but many good things have to be omitted for want of space.

FLORISTS' FLOWERS.

TREE CARNATION DUKE OF YORK.

Herewith I send you blooms of the above, which is a seedling raised at Mr. H. B. May's nurseries, Edmonton, and flowered last season. The plants having been stopped for cuttings, we have not had many blooms through the winter, but it flowered well last autumn, and we are now getting some good blooms. Hitherto good crimsons have been scarce among the Tree Carnations, and anything new in that way is very acceptable, it being a colour much in demand. Duke of York is a very vigorous grower, the large full flowers have a very bright shade, particularly when first opened, and have the perfume of the old Clove. *A. Hemsley.* [The flowers sent with the above note were of a beautiful shade of deep crimson, like the old Clove, compactly formed, double, sweet-scented, and the "grass" vigorous. Ed.]

The Pink.

The garden varieties are now throwing up their flowering stems, and these tender growths are so very attractive to the small birds that I find it necessary to protect them by straining thread a few inches above the plants, but owing to the dry weather this year this method is not found sufficient to keep them off altogether. It has been capital weather the last few weeks to get beds of Pinks, Pansies, Carnations, &c., hoed and raked, and made neat. The forcing Pinks are useful at this season to furnish supplies of choice flowers, and they are easily forced, although to get the flowers in good condition the plants should be placed close to the roof of the forcing-house, and the temperature not allowed to exceed 55° at night. When the plants reach the flowering stage, pipings can be taken, which strike readily in a gentle bottom-heat in a frame or a forcing-house. If they are in a heated house it is necessary to place them in a frame or hand-light, but they must be daily examined, and inside of the top of the frames, &c., wiped dry. The pipings are apt to damp off if the frame be kept too close. *J. Douglas.*

CULTURAL MEMORANDA.

STREPTOSOLEN JAMESONII

This greenhouse evergreen shrub should be more commonly grown, its flowers being freely produced at the ends of the shoots in large clusters, which are of a beautiful cinnamon-red. With regard to training, possibly the better way is to fix the branches loosely to a wall, trellis, or pillar. It is a plant which can be made to grow into a fine specimen in a pot and trained to balloon-shaped or other kinds of trellis, for use in the conservatory or greenhouse. Nice decorative plants may be grown in 32's, provided the ends of the shoots are pinched in whilst growing. A suitable soil at first is sandy light loam, mixed with leaf-mould, coarse sand and a small quantity of dry cow-manure; but as the plants get older, richer soil may be afforded. Cuttings taken with a heel and put in pots of sandy soil and plunged under a handlight in a good bottom-heat root freely. The cuttings should be shaded from bright sunshine, and not want for water; many failures have been noticed when the cuttings have been placed (as they should be), close to the sides of the pots, and allowed to get dry and shrivelled. *H. Markham, Mereworth Castle.*

THE APIARY.

THE WELLS' SYSTEM.

The interest generally aroused among bee-keepers, in this the latest system of beekeeping, whereby two queens exist in one hive, continues quite unabated. Judging by results to date, it seems more than ever probable that a new era has dawned in modern beekeeping, and that the busy bee can in the future be prevailed upon to yield more surplus honey than she has ever done in the past. The bees in a double-queened hive in the possession of the writer, appear to have considerably more than twice the go and energy of the single queen stocks. The amount of pollen being carried in is very large, and the bees are well at work storing honey in the surplus chamber, which contains standard frames for extracting. Two comparatively weak stocks were put into this hive late this spring, and there is no doubt that had a fair start been made by getting the hive ready and the bees established in it the previous autumn, so as to have wintered together, they would now be in a more forward condition. Surplus honey from fruit blossom is so rarely obtained by ordinary beekeepers, that it is a distinct gain to be able to count on honey from this source, and there is no doubt that it may be readily obtained in quantity from double-queened hives should the weather be favourable. The perforated division-board that Mr. Wells uses, for keeping the two queens separate, it appears is moveable, and not a fixture as many supposed. It is kept in position by small staples driven in on each side, these projecting

one-sixteenth of an inch from the side of the hive. It is made of yellow pine planed down to one-eighth of an inch thick, and by selecting well-seasoned wood, and by reason of the perforations in it, no trouble is occasioned by warping. *Expert.*

FORESTRY.

SEASONABLE NOTES.

The exceptional dry weather experienced of late in most parts of these islands has been beneficial in promoting a loose friable surface to the soil, which will prove very beneficial to sowings of tree seeds. The seeds of Conifers as a general rule prefer a soil that is dry and sandy, therefore the soil of the beds should be well worked so as to render it soft and pliable. The beds may be formed of a width of 4 feet, and of any desired length. Previous to sowing Larch seed, the land should be soaked with water and turned several times a day for a few days before sowing. One pound of good Larch seed of home growth should be allowed for sowing about 5 lineal yards of a bed of the above width; but where foreign seed is sown, it may be sown rather thinner, the vegetative power being greater than that of home-grown seed. In sowing the seed it should be evenly distributed broadcast, and pressed into the earth with a light roller, covering it with quarter of an inch layer of fine soil. The time for sowing is towards the end of this month, and as late as the first week in May. In some parts of the country it is necessary to stick a few evergreen twigs here and there into the seed-beds to act as a screen from late frosts, and the beds should always be protected from birds and vermin until such time as the plants are strong enough to take care of themselves.

Scotch Fir Seed may be sown at the same time and manner, with this difference, that 1 lb. of Scotch Fir seed should be allowed for about 12 lineal yards of a 4-foot bed, and the covering of mould should be about half an inch thick. The seeds of hardy exotic Conifers being very unequal in size, and not starting to grow at the year of sowing, the forester should bear this in mind, and regulate the depth of the covering, and the distance apart at which to sow them. Sow seeds of hardy trees and shrubs among rocks on elevated spots where the soil is thin and poor, rather than set out plants.

Young Plantations.—No time should now be lost in making up gaps with transplanted stuff, which have stocky stems and stout fibrous roots; some extra care being taken to expose the roots for as short a time as possible to the air during the progress of the work. Trees planted on the notch plan on heather-covered land are apt to suffer in a time of drought by reason of the sods curling up at the edges and exposing the roots. Such plants ought to be set up, and the sods closed in on the roots by trampling them, and in most cases some soil may be added and made firm around the base of the stem.

Continue to transplant forest and ornamental trees and shrubs in the nursery as a preliminary step to planting them permanently next year. This is a point of considerable importance, and should always receive timely attention. Forest and ornamental trees may be now grafted, and those grafted some time ago should be looked to. *J. B. Webster, Fairview, Stangmore, Dungannon.*

FRUIT REGISTER.

APPLE REINETTE DU CANADA.

I have sent you a few Apples for your inspection of the above-named Apple, which has been kept in a fruit-room facing north in which the thermometer registered 4° to 5° of frost for several days together. As so many gardeners are writing of the qualities of Apples at this late part of the season, I think attention should be drawn to this one as being well worthy of more general cultivation. It is in use from December up to the present, and we shall have them well into next month. The fruits are usable either for table or culinary purposes. I may add that the tree is not a great cropper before it gets of good size, then it crops heavily and regularly. We gathered 18 bushels from one tree in the autumn of 1891, and 16 bushels from the same tree in the autumn of 1892. *A. Gooden, Shopwyke House, Chichester.* [The fruit sent was in good condition, of high colour, and with juicy pleasantly brisk flavour. Ed.]

LAW NOTES.

AN INTERESTING FLOWER SHOW DISPUTE.

At the Bristol County Court, held on Friday, the 14th inst., before his honour, Judge Austin, the case of Williams *v.* Keynsham Horticultural Society, was tried.—Mr. J. Nichols was for the plaintiff, James Williams, and Mr. J. C. Gilmore defended. The plaintiff claimed 17*s.* 6*d.*, the value of prizes awarded to him for certain exhibits at the Society's show in August last. The facts were admitted, but the Society declined to pay the prizes on the ground that by the rules plaintiff was not eligible to compete on account of the rental of his cottage and allotment being above £13 per annum. Plaintiff admitted that his payment in respect of the cottage was £13, and of the allotment 6*s.* 9*d.*, but said the £13 was subject to a deduction for rates, which brought the net payment to the landlord down to £11 3*s.* 5*d.* The defendants argued that the payment was 5*s.* per week, and that represented the rent as defined by the rules of the society. Rent, they said, meant the tenant's payment, and not the annual value of the property, which was often difficult to ascertain. It was the first time since the show was established, twelve years ago, that a question had arisen as to the meaning of the word rent in the rules. After hearing arguments, the Judge said, in his opinion, the defendants were entitled to judgment on the ground that the word rent in the rules meant rent in the ordinary sense of the term—what the tenant actually paid the landlord for the premises. *Bristol Mercury, April* 15.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees — a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.

Districts.	Temperature: Above (+) or below (—) the Mean for the week ending April 22.	Temperature: Accumulated: Above 42°, for the Week.	Below 42°, for the Week.	Above 42°, difference from Mean since January 1, 1893.	Below 42°, difference from Mean since January 1, 1893.	Rainfall: More (+) or less (—) than Mean for the Week.	No. of Rainy Days since Jan. 1, 1893.	Total Fall since Jan. 1, 1893.	Bright Sun: Percentage of possible Duration for the Week.	Percentage of possible Duration since Jan. 1, 1893.

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.: 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

The following summary record of the weather for the week ending April 22, is furnished from the Meteorological Office:—

"The *weather* continued fine and dry over the eastern and southern parts of the United Kingdom, but was rather unsettled in the west and north, the amount of rainfall being upon the whole the largest recorded for several weeks past. Thunderstorms occurred in many parts of Great Britain on the 20th, and at some of our south-western stations on the 21st or 22nd.

"The *temperature* was above the mean in all districts, the excess being slight (3° to 4°) in Scotland, but very large (7° to 9°) over the greater part of England and Ireland. The highest readings were observed mostly on the 19th or 20th, but at some of the western stations they occurred later in the week; the thermometer exceeding 70° in all districts, excepting 'Scotland, N.,' and exceeding 80° over a considerable portion of England. At Cambridge the maximum on the 20th was as high as 84°. The lowest readings were registered mainly at the beginning of the period, when the thermometer fell below 40° in all districts, excepting 'Ireland, S.,' and below the freezing point in many parts of Great Britain; the lowest reading of all being 26° at Lairg and Cirencester. At the inland stations the diurnal range was again very large.

"The *rainfall* was less than the mean in all the Wheat-producing districts, as well as in 'England, S.W.,' and the 'Channel Islands.' In 'England, N.W.,' the average amount was just reached, while in Ireland and the west of Scotland there was a slight excess.

"The *bright sunshine* was upon the whole less prevalent than for some weeks past, the aggregate amount in Ireland and Scotland being below the average. In the eastern, central, and southern parts of England, however, there was again a large excess. The percentage of the possible duration ranged from 24 in 'Scotland, E.,' to 57 in 'England, E.,' and 58 in 'England, S.'"

MARKETS.

COVENT GARDEN, April 27.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

Business keeps steady, with market well supplied, especially with Grapes and Strawberries. *James Webber, Wholesale Apple Market.*

POTATOS.

Trade for old Potatos still continues very bad, except for a few good samples, which maintain fair prices.

NEW POTATOS.—Malta and Teneriffe are arriving in large quantities, and selling freely. Rounds, Malta, 11*s.* to 14*s.*; Kidneys, 16*s.* to 20*s.*; Teneriffe Rounds, 9*s.* to 11*s.*; Kidneys, 12*s.* to 18*s.* per cwt. *J. B. Thomas.*

SEEDS.

LONDON: *April* 26.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write, that to-day's market, as might have been expected, was thinly attended, with no change in the situation worth noting. This remarkable drought is now getting serious and is cruelly postponing sowing operations. Meantime, available stocks are quite small and prices generally unaltered. Vegetables having naturally become scarce, there is marked improvement in the trade for Blue Peas. Haricot Beans keep steady. For Scarlet Runners there is more inquiry. Canary seed now exhibits a considerable drop from recent top prices. Hemp seed slow. Mustard and Rape seed firm. Linseed quiet.

FRUITS AND VEGETABLES.

BOROUGH: *April* 25.—Quotations:—Spinach, 3*s.* to 4*s.*; Kale, 3*s.* to 5*s.* per bushel; Broccoli, 4*s.* to 5*s.* per bag; Greens, 5*s.* to 6*s.*; Parsley, 3*s.*; Carrots, 1*s.* to 2*s.*; Turnips, 2*s.* to 2*s.* 6*d.* per dozen bunches; English Onions, 12*s.* to 15*s.* per cwt.; Horseradish, 2*s.* to 3*s.* 6*d.* per bundle; Apples, 4*s.* 6*d.* to 6*s.* per bushel.

SPITALFIELDS: *April* 25.—Quotations:—Cauliflowers, 5*s.* to 10*s.*; Cabbages, 4*s.* to 5*s.* per tally; Curly Kale, 1*s.* 6*d.* to 2*s.*; Spinach, 2*s.* to 3*s.* per bushel; Sprouting Broccoli, 3*s.* to 4*s.* per sack; Greens, 3*s.* to 4*s.* per dozen bunches; natural Rhubarb, 1*s.* to 2*s.*; Mint, 3*s.* to 5*s.* per dozen bunches; Horseradish, 2*s.* to 3*s.* 6*d.* per bundle; Turnips, 3*s.* to 4*s.* per cwt.; Egyptian Onions, 11*s.* to 12*s.* 6*d.* per cwt.; frame Cucumbers, 3*s.* to 6*s.*; Cabbage Lettuces, 6*d.* to 9*d.* per dozen; Mustard and Cress, 2*s.* per dozen baskets; American Apples, 12*s.* to 18*s.* per barrel.

FARRINGDON: *April* 27.—Quotations:—Carrots, 3*s.* to 3*s.* 6*d.* per cwt.; English Onions, 13*s.* to 15*s.*; Beetroot, 1*s.* per bushel; long French Radishes, 9*d.* per dozen bundles; Lettuces, 9*d.* per dozen; Cucumbers, 2*s.* 6*d.* to 3*s.* per dozen; Apples, Tasmanian, 8*s.* 6*d.* to 9*s.* 6*d.* per box; do., American 12*s.* 6*d.* to 18*s.* (Nonpareils) per barrel.

STRATFORD: *April* 26.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade has been done at the undermentioned prices:—Greens, 5*s.* to 7*s.* per bag; do., 4*s.* to 5*s.* per sieve; Cauliflowers, 1*s.* 6*d.* to 2*s.* per dozen; do., 6*s.* to 11*s.* per tally; Carrots, household, 40*s.* to 50*s.* per ton; do., cattle-feeding, 18*s.* to 34*s.* do.; Parsnips, 6*d.* to 9*d.* per score; Mangels, 16*s.* to 20*s.* per ton; Onions, English, 220*s.* to 240*s.* do.; do., Dutch, 8*s.* to 8*s.* 6*d.* per bag; Egyptian, 10*s.* 9*d.* to 11*s.* 6*d.* per case; Apples, English, 2*s.* to 6*s.* per bushel; do., American, 12*s.* to 20*s.* per barrel; Sprouting Broccoli, 3*s.* to 5*s.* per bag; Rhubarb, 1*s.* to 2*s.* per dozen; Cucumbers, 3*s.* to 4*s.* per dozen; spring Onions, 6*s.* to 7*s.* per dozen.

POTATOS.

BOROUGH: *April* 25.—Quotations:—English Magnums, 40*s.* to 60*s.* per ton. New, 18*s.* to 25*s.* per cwt.

SPITALFIELDS: *April* 25.—No alteration in prices to be recorded this week.

STRATFORD: *April* 26.—Quotations:—Magnums, 35*s.* to 60*s.*; Bruces, 40*s.* to 65*s.*; Imperators, 40*s.* to 60*s*; Scotch Magnums, 50*s.* to 65*s.*; do. Bruce's, 60*s.* to 75*s.*; Main Crop, 80*s.* to 90*s.* per ton.

FARRINGDON: *April* 27.—Quotations:—Main Crop, 80*s.* to 85*s.*; Imperators, 50*s.* to 70*s.*; Bruce's, 60*s* to 65*s*; Magnums, 60*s.* to 65*s.*; Parson's Magnums, 40*s.* to 45*s.* per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending April 22, and for the corresponding period last year:—1893: Wheat, 25*s.* 5*d.*; Barley, 24*s.* 5*d.*; Oats, 18*s.* 8*d.* 1892: Wheat, 30*s.* 8*d.*; Barley, 25*s.* 11*d.*; Oats, 20*s.* 7*d.*

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80*s.* to 115*s.*; do., inferior, 70*s.* to 75*s.*; hay, best, 85*s.* to 115*s.*; do., inferior, 65*s.* to 75*s.*; and straw, 33*s.* to 46*s.* per load.

Answers to Correspondents

ARISTOLOCHIA: *Neve Bros.* This word is usually pronounced Aristolō chia. It would be more correct, though pedantic, to say Aristolŏch-ia. Both o's in the Greek are short. Sipho is correct.

CATERPILLAR ON GOOSEBERRY AND CURRANT: *J. D.* What you mean is the Gooseberry saw-fly caterpillar (see fig. 77). It is almost too late to effect much this season. You might apply Pyrethrum or Hellebore powder, but refraining from making use of the fruit for a few weeks. Clear away all the soil under the bushes to a depth of 3 or 4 inches, and char it, replacing it with fresh. This is best done in November.

FIG. 77.—NEMATUS VENTRICOSUS: THE GOOSEBERRY SAW-FLY.

COTTAGE GARDENER: *B. and D. C. and P. S.* A man of small means, a workman, day labourer, or the like, who inhabits a cottage, and cultivates garden or allotment land.

EARLY SWARMING OF BEES: *T. T.* This always occurs in unusually warm springs.

INSECT: *W. A. S.* The flies are Scatophaga stercoraria; their grubs live in dung. *R. M. L.*

MOSS AND SEDGE FROM THE PENTLANDS: *A. S.* A bit of the box and your note came to hand, but no plants.

NAMES OF PLANTS: *Jas. Jno. H.* Acer japonicum, polymorphum atro-purpureum. The narrow leafed one is A. j. p. atro-purpureum dissectum.—*J. D.* Cerasus Padus, Bird Cherry.—*B. R.* 1, Magnolia conspicua; 2. M. Soulangeana; 3, M. hybrid; 4, Berberis stenophylla; 5, Ribes speciosum; 6, a Crab-apple.—*G. H.* sends twice as many as we undertake to name: 1, some Palm; 2, Cytisus spinosus; 3, one of the Crab-apples; 4, Helianthemum sp.; 5, Centranthus ruber; 6, Doronicum caucasicum; 7, Corydalis lutea; 8, Anemone nemorosa, double-fl. var.; 9. Crinum, send good blooms; 10, Begonia florabunda; 11, Begonia manicata.—*J. C. S.* You should send to a Tulip fancier.—*C. J. R.* Abutilons; send them to some nurseryman who grows them. We cannot undertake to name florists' flowers. — *Mrs. G.* Amygdalus nana, Dwarf Almond.—*J. G.* 1, Pyrus japonica; 2, Staphylea pinnata; Apples are too much decayed for identification.—*Neve Brothers.* Hedera Rœmeriana.—*J. R. H.* Helleborus fœtidus.—*W. Mallows.* Jasminum simplicifolium.—*S. & S.* Amelanchier vulgaris.—*W. Apted.* Thunia Marshallæ.—*S. Mortimer.* Pontederia crassipes.—*A. Z. X.* Epidendrum Stamfordianum.—*F. C. S., Coventry.* 1, Cymbidium aloifolium; 2, Bifrenaria Harrisonæ; 3, a Davallia, perhaps D. elegans.—*J. Ulicott.* Angræcum eburneum var. virens.—*W. H. Hillier.* Ribes aureum.—*C. M.* A form of Pyrus Aria. *E. W.* Galeandra Devoniana.—*H. W. Ward.* A fine variety of Odontoglossum Andersonianum.—*W. Daws.* Oncidium Marshallianum.—*J. M.* 1, Dentaria digitata; 2, Cytisus hirsutus; 3, Alyssum saxatile; 4, Euphorbia hibernica; 5, E. Characias.

PEAR: *T. K. & Co.* The leaves are injured by a mite, Phytoptus piri.

QUASSIA WATER: *A. G. B.* Boil 4 oz. of Quassia chips 10 minutes in 1 gall. of water, strain off the water, and add 4 oz. of soft-soap, which should be dissolved in it before it cools. A quarter of an hour after applying the Quassia-water, well syringe the tree with clean water. Good for green and black-fly on fruit trees, Roses, &c.

SEEDLING APPLE: *B. & Son.* Your Apple is certainly a first-rate keeper, and as you say it is a good cropper; these are two points in its favour. It is however, undersized, and the flavour, although agreeable, is not very good. The skin too, is rather tough. In respect to the Royal Horticultural Society, we can positively say that exhibits are judged entirely upon their merits, whether sent by members or non-members. According to your own word, when the Apples were last sent to that body, it was so much earlier in the season that their keeping qualities were not tested, and as its cropping habit has to be seen to be known, the Society would be unable to judge it as to the very qualities which you claim it possesses. There is room for some new varieties of first-rate late Apples, but we doubt whether the one in question is sufficiently good in size and flavour.

VINES: *P. C. H.* The roots have been dying for some years, and their death was due to the bad state into which the border had got in the twenty-six years that have elapsed since it was so badly made. Clear out everything, and make a new start.

WASPS: *W. S.* The wasp is a queen of Vespa sylvestris, which is very common in some places, but more local than the common wasp. The date is early, and to be accounted for by the weather. Queens of the common wasp are unusually abundant; it by no means follows from this that autumnal wasps will be abundant. *R. M. L.*

WOODLICE IN FERNERY: *G. McK.* Pour boiling water by day into all likely hiding-places, crevices, beneath stones, &c., and continue to do this daily. Do not pour the water on the roots of the plants. The wall covering of Ficus repens might be cleared of them by syringing it with Quassia-water.

Testimonials.

"Shirburn Castle, January 5, 1890.

"SIR,—As you requested my opinion of the houses which you erected for me some 4 years ago, I beg to inform you that I consider them a perfect success, and I have recommended them to many of my neighbours.—Yours truly (signed) MACCLESFIELD."

"Hornby Castle, Lancaster, February, 1890.

"Major FOSTER has much pleasure in stating that the vineries and forcing-houses which were erected by Mr. Helliwell in 1884, continue to give perfect satisfaction, both to himself and his gardener."

"Estate Office, Ripley, Yorkshire, January 23, 1890.

"Sir HENRY INGILBY has much pleasure in stating that the glazing work executed by you, under your patented system, at the Ripley Castle Gardens, has been in every respect entirely satisfactory. The work has stood its 8 years' wear and tear extremely well, and has hitherto cost nothing to keep it in repair."

PEARSONS' CHEMICAL MANURE.

This Manure has now been before the public for five years, and has, from its intrinsic merits, almost without advertising, forced its way into the front rank. Extensive trials during above period have convinced us, that for efficiency and cheapness, there is nothing in the market to touch it; we having employed it with the fullest success upon Vines and other Fruit Trees, Pelargoniums, Fuchsias, Chrysanthemums, and almost all kinds of Greenhouse Plants; this opinion is supported by all the gardeners who have tried it, all being enthusiastic in its praise.

Per ton, £16; per cwt., 20s.; ½ cwt., 12s.; 28 lb., 7s.; 14 lb., 4s; 7 lb, 2s. 6d. Sample Tins, 1s. 3d.

Half-cwt. and upwards sent Carriage Paid to any Station in England, Scotland, or Wales.

Circular, containing further details, instructions, and testimonials, free on application.

J. R. PEARSON & SONS,

CHILWELL, NOTTS.

BEESON'S MANURE.

Has now been universally used in all the principal gardens for over twenty years, and has proved the Best and Cheapest Fertiliser for Vines, Plants, Vegetables, and all purposes. With the aid of entirely new machinery, it is now being sent out in splendid condition. Write for Circular containing the leading gardeners and market growers reports. Sold in tins at 1*s.*, 2*s.* 6*d.*, and 5*s.* 6*d.* and 10*s.* 6*d.* each; also in 1 cwt. bags, sealed, 13*s.* each, by all Seedsmen; or apply direct. 1 cwt. and above is sent carriage-paid for cash with order, and special terms for large quantities. Directions for use are placed in each bag, and printed on tins.

GARDENERS AND OTHERS WANTING SITUATIONS. *26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.*

Births, Deaths, and Marriages, 5s. each insertion.

NOTICE TO ADVERTISERS.—*In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.*

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSITION.—*Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.*

POSTAL ORDERS.—*To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to* A. G. MARTIN, *as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.*

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST *reach the Office not later than Thursday noon.*

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements,
41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

COLLECTOR of RENTS in the Country.—Age 33 years; fourteen years' character. Highest references; security if necessary.—X. O., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

HOLLOWAY'S PILLS.—All our Faculties.—Almost all disorders of the human body are distinctly to be traced to impure blood. The purification of that fluid is the first step towards health. Holloway's Pills recommend themselves to the attention of all sufferers; no injurious consequences can result from their use, no mistake can be made in their administration. In indigestion, confirmed dyspepsia, and chronic constipation the most beneficial effects have been, and always must be, obtained from the wholesome power exerted by these purifying Pills over the digestion. Persons whose lives have been restored to ease, strength and perfect health by Holloway's Pills, after fruitless trials of the whole pharmacopœia of Physic, attest this fact.

GREEN'S PATENT "SILENS MESSOR" AND "NEW MONARCH"

ROLLING AND COLLECTING MACHINES FOR 1893.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in **constant** *use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.*

Patronised by— They are the first, foremost, and best in the world.

HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS.
The Late EMPEROR OF THE FRENCH. The EMPEROR OF RUSSIA,
And most of the NOBILITY, CLERGY, and GENTRY of the United Kingdom.

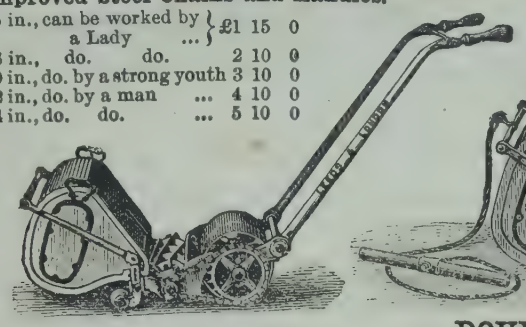
Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The *"Journal of Horticulture," of June 9, says:*—"MOWING MACHINES.—After a critical examination, the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 195,000 of these Machines have been Sold since they were first introduced in the year 1856,
And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.
They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

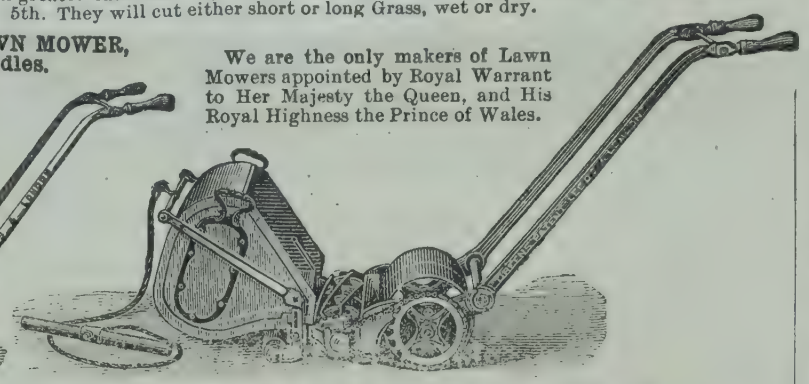
The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

SINGLE-HANDED SILENS MESSOR LAWN MOWER,
With Improved Steel Chains and Handles.

To cut 6 in., can be worked by a Lady ...	£1	15 0
To cut 8 in., do. do.	2	10 0
To cut 10 in., do. by a strong youth	3	10 0
To cut 12 in., do. by a man ...	4	10 0
To cut 14 in., do. do. ...	5	10 0



We are the only makers of Lawn Mowers appointed by Royal Warrant to Her Majesty the Queen, and His Royal Highness the Prince of Wales.



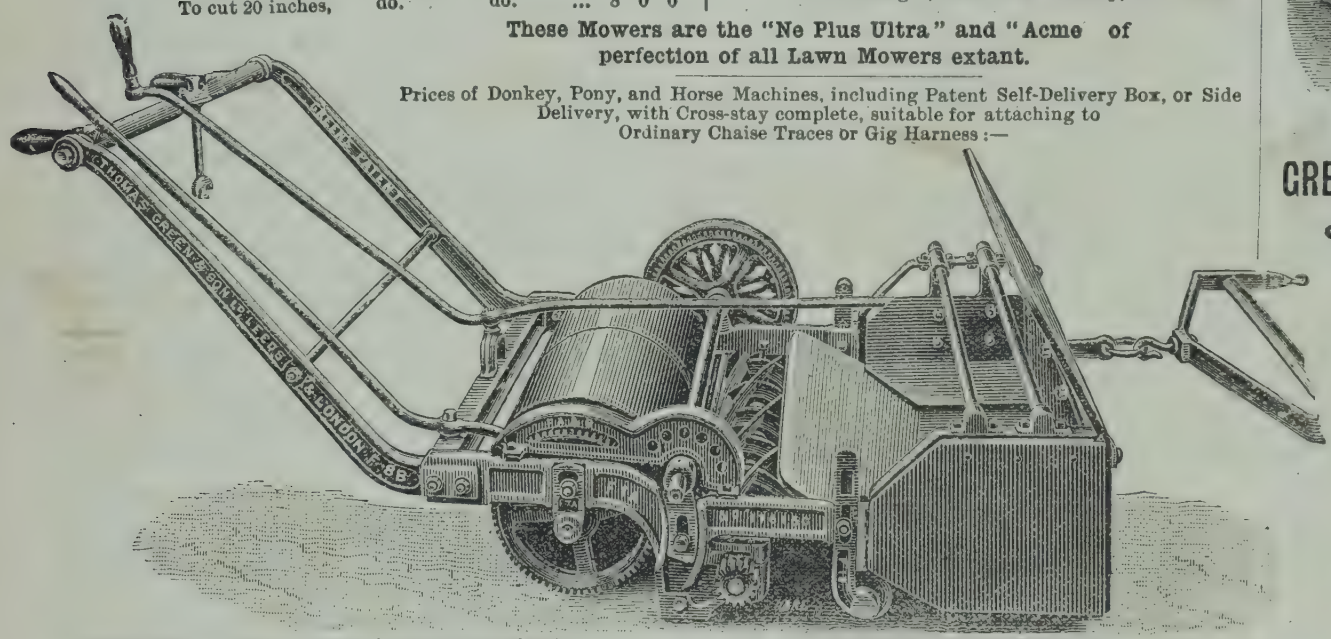
DOUBLE-HANDED LAWN MOWER.

To cut 16 inches, can be worked by one man on even lawn ...	£6	10 0
To cut 18 inches, do. man and boy...	7	10 0
To cut 20 inches, do. do. ...	8	0 0
*To cut 22 inches, can be worked by two men	£8	10 0
*To cut 24 inches, do. do. ...	9	0 0

* If made stronger, suitable for Donkey, 30*s.* extra.

These Mowers are the "Ne Plus Ultra" and "Acme" of perfection of all Lawn Mowers extant.

Prices of Donkey, Pony, and Horse Machines, including Patent Self-Delivery Box, or Side Delivery, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—



DONKEY AND PONY MACHINES.

To cut 26 inches	£14 0 0
To cut 28 inches	16 0 0
To cut 30 inches	18 0 0
Leather Boots for Donkey	1 0 0
Leather Boots for Pony	1 4 0

HORSE MACHINES.

To cut 30 inches	£22 0 0
To cut 36 inches	26 0 0
To cut 42 inches	30 0 0
To cut 48 inches	34 0 0
Leather Boots for Horse	1 9 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the machine. Packing Cases as per List, except when for export.

REDUCED PRICES OF

This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. **Price, 2s. post-free.**

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

MESSENGER & COMPANY, LOUGHBOROUGH.
London Office:—163, Palmerston Buildings, Old Broad Street, E.C.

LINDLEY'S SCHOOL BOTANY. A Complete Manual of Rudimentary Botany for Students, &c. With 400 Illustrations 8vo, cloth, price 5*s.* 6*d.*

C. BEESON'S MANURE.—The best Fertiliser for all purposes. Demand increasing weekly. One trial will prove its value. Pure Bones any size, raw or dissolved, 8s. per cwt. Write for particulars.
C. BEESON, The Bone Mills, St. Neot's, Hunts.

FOWLER'S GARDENERS' INSECTICIDE.—Established twenty-five years, thoroughly destroys all insect life and mildew in plants generally; will not stain or injure any more than plain water. In jars, 1s. 6d., 3s., 5s. 6d., and 10s. each; and in kegs, 28 lb., 21s.; 56 lb., 42s.; 112 lb., 84s. each. Sold by all Seedsmen.—CORRY AND CO., Limited, 13, 15, and 16, Finsbury Street, London, E.C.

"KILLMRIGHT,"
For Destruction of all Insect Pests and Mildew.
THE STOTT DISTRIBUTOR CO. (Lmtd.),
Barton House, Manchester.

"SLUGICIDE," REGISTERED.—Certain death to Slugs, fertiliser to soil, perfectly harmless to plants and domestic animals. The greatest boon to Gardeners yet invented. 1s. 6d. per box, of Seedsmen, or post paid of
THE "SLUGICIDE" CO., 6, Maryleport Street, Bristol.

GISHURST COMPOUND, used since 1859 for Red Spider, Mildew, Thrips, Greenfly, and other blight; 2 ounces to the gallon of soft water, 4 to 16 ounces as a winter dressing for Vines and Orchard-house trees, in lather from cake, for American blight, and as an emulsion when paraffin is used. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s. from the Trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

FIR-TREE OIL

SOLUBLE INSECTICIDE.

The most pleasant and reliable of all insecticides for destroying insects on plants, animals, and birds. Thousands of testimonials received from all parts of the world. Bottles, 1s. 6d., 2s. 6d., 4s. 6d., 7s. 6d., and 12s. 6d.; in bulk, 11s. per gallon, with full directions for use.

Wholesale from all Horticultural Dealers.

SILICATE MANURE.

Dress Your Vines and Tomatos with it now.

"Royal Nurseries, Great Grimsby,
"September 2, 1892.

"We have used it liberally on Tomatos and Vines. The Tomatos have been a wonderful crop. The Manure seems to have a very great effect on the ripening and swelling of the fruit. Faithfully yours, (Signed),
"CHARLES COLEBROOK AND SON."

PRICES IN SACKS, AT WORKS—
10s. per Cwt.; £2 per ¼-Ton; £3 15s. per ½-Ton; £7 per Ton.

ADDRESS—THE CHEMICAL WORKS,
HEMEL HEMPSTEAD, HERTS.

PEARSONS'
CHEMICAL MANURE.

This Manure has now been before the public for five years, and has, from its intrinsic merits, almost without advertising, forced its way into the front rank. Extensive trials during above period have convinced us, that for efficiency and cheapness, there is nothing in the market to touch it; we having employed it with the fullest success upon Vines and other Fruit Trees, Pelargoniums, Fuchsias, Chrysanthemums, and almost all kinds of Greenhouse Plants; this opinion is supported by all the gardeners who have tried it, all being enthusiastic in its praise.

Per ton, £16; per cwt., 20s.; ¼-cwt., 12s.; 28 lb., 7s.; 14 lb., 4s.; 7 lb, 2s. 6d. Sample Tins, 1s. 3d.

Half-cwt. and upwards sent Carriage Paid to any Station in England, Scotland, or Wales.

Circular, containing further details, instructions, and testimonials, free on application.

NEW COLEUS, "DISTINCTION."
INTRODUCED 1892.
To the Trade, 9s. per dozen, in Small Pots.
This is undoubtedly the finest introduction in the way of Coleus yet announced, and will prove a most valuable acquisition for Bedding or Decorative Purposes, the foliage being of a striking reddish rich maroon, and darker in colour than any other variety; it is also of a very sturdy growth, and hardy character.
Award of Merit from the Royal Horticultural Society, August 23, 1892.

Gardeners' Chronicle.

SATURDAY, MAY 6, 1893.

KEIR HOUSE, DUNBLANE.

(SEE FIG. 80, P. 545.)

OF the many beautiful demesnes of Perthshire, none is better known to Scotchmen than the subject of these remarks, and whose pleasure grounds and beautiful surrounding scenery are justly noted. The records of this ancient seat carry one far back in point of time, and show a number of distinguished owners. The present proprietor, Archibald Stirling Maxwell, Esq., has become a popular man in the district, and is very greatly respected. He is the second son of the late well-remembered Sir William Stirling Maxwell of Keir and Pollock, and Lady Anna, whose names were intimately associated with the fine arts, which are so visible in a tangible form at Keir. Sir William was an ardent horticulturist, a good forester, and a very sagacious agriculturist, who left proofs of his love for these pursuits, and lasting memories of a refined taste, as may be seen in the extensive grounds, park, and estates.

In the spacious mansion, sculpture, paintings, carving, and other objects of art are to be seen; in the grounds there is much that shows the art of the skilful gardener, and great expenditure of money also. It is very pleasing to note that the present youthful proprietor is credited with inheriting the excellent and refined good taste which characterised his forbears. Now that Keir is getting famed for high-class gardening under the management of Mr. Lunt, we hear much more of its productions; and also at horticultural shows, many of those for which Keir is favourably known are to be noted. At Glasgow, Edinburgh, and Stirling, these exhibits for years have created some anxiety among a few of the older hands who have long competed in friendly contests. Mr. Lunt's Royal George Peaches have been examples of great merit, while the Black Hamburgh, Muscat of Alexandria, and Mrs. Pince Grapes have taken many of the best prizes; and his Cyclamens and stove plants are among the specialties which have been observed in fine condition at the leading autumn shows of recent years. Mr. Lunt is the son of the well-known veteran horticulturist who has so successfully managed, for nearly forty years, the gardens of Sir Michael Shaw Stewart at Ardgowan; and it will not be a matter for surprise if the young man does not "rive his father's bonnet" when further experienced.

Many gardeners have gone far out of their way to inspect the gardens at Keir; and towards the end of the month of last November I also took advantage of circumstances which enabled me to see much that was pleasing and instructive even at that season. The splendid display of Calanthe vestita and of Cyclamens were of themselves attractions enough for a gardener. The place is entered by massive gates from the Bridge of Allan side of the park, then a grand avenue of Limes is passed, affording a glance over the bridge which spans a rapid burn, by the side of

*

which some beautifully romantic scenery may be noticed. Ere long, the hand of the improver will be busy in this portion of the grounds, and then the entrance in this direction will have still greater charms. Passing on through the park, Mr. Lunt, who came with me, pointed out the various fine trees and beautiful views as these came in sight—the "ancient towers of stately Keir," as Scott describes them in his "Lady of the Lake;" and to a certain clearing away of numerous trees, thus opening up a fine view towards the mansion and some objects of interest or beauty in the grounds.

Turning to the forcing garden, a long range of vineries and peacheries was entered, 400 feet long, lofty but narrow, and said to be close on 100 years old, their wonderful preservation indicating the employment of good materials, and first-class workmanship, besides much care since their erection, a lesson in economy which might well be copied in these times of all-round retrenchment. Entering by the eastern door, I found Royal George and Late Admirable Peach trees, two varieties which are still in great request in many parts of Scotland; Nectarines, Pine-apple, Elruge and Violette Hative, which here do remarkably well, the fruits attaining a good size and very high skin tints. In a late vinery, bunches of Mrs. Pince Muscat were thickly hanging, the bunches weighing from 3 to 6lb. each. It is a Grape that is much favoured here, and it is certainly a well-flavoured one. The 1st prize in a class was awarded, and justly too, at Edinburgh in September last, to an exhibit cut from these Vines. The Cyclamens noted in one of the houses in this range were robust in growth and splendidly flowered. Some of these had been taken to Stirling and Edinburgh shows, where they were awarded, in each case, 1st prizes. Some Vines which were observed, are said to have been planted some ninety-eight years ago, and certainly looked their age. Much work carefully done, has been carried out to help these old Vines. An old stone building in the centre of the range, having a glass front, though partly dark, was filled at the time with fine specimens of Cyathea medularis, some Palms, Ferns, &c. Another house of Vines was noted, from which the heaviest bunch, 5 lb. 12 oz., was cut and shown at Glasgow last autumn. The others, though not so large, were very perfect in form, with large berries of fine colour. Among the Peach trees, I saw on this occasion, were two fine ones, that had produced 480 fine fruits last season; also fine Nectarine trees were passed, and a space which was covered with Gloire de Dijon Rose, which does good service in producing early blooms. When out in the kitchen garden, one could not help wondering why such a range of glass as this, should have been placed at the bottom of the garden, while above, at a considerable altitude, there is ground with a wall, sheltered from the north, and finely exposed to the sun, and with perfect drainage. The erection of a new range of glasshouses is in contemplation, and this should be the place for it, but leaving the old houses standing till the trees, &c., in the new one were well established and in full bearing.

The crops in the kitchen garden were mostly excellent, Brussels Sprouts being especially good, which could not be said of this crop generally in the North; lines of espalier Pears were remarked of greater height than I ever saw them anywhere else, and probably they were as old as the garden itself. Much work has already been accomplished in the matter of renovations and improvements, a commodious gardener's house having been built, and the walks put in good order.

Camellias and Chrysanthemums, Cyatheas and Lapageria rosea, Cytisus in flower, and Palms were observed in a large span-roofed house; and in another, also span-roofed, were numbers of Arecas and Kentias in capital form; numerous fine healthy specimens of Adiantum, with fronds fit for cutting; and besides these some Gymnogrammas. Passing by many attractive objects, the object of my visit was reached, the Calanthes. The flower-spikes numbered more than 200, but they were more remarkable for the fine sturdy habit of the plants and the high colour of the flowers than for great length of growth. Some C. Veitchii were from 3½ to over 4 feet tall, and in the best condition. It was observed that air and light were liberally afforded, which has the effect of strengthening the flowers; and those nearest to the front of the house were the finest in colour. One could scarcely tire of looking on these gems, which were backed up by specimen foliage plants, consisting of Anthuriums, Nepenthes—one of N. Rafflesiana had one hundred pitchers. In this range, a three-quarter span, were some remarkably fine Crotons, large specimens, beautifully coloured; and an Alocasia metallica, over 6 feet through, is one of the finest specimens extant. A plant of Allamanda Hendersonii was a mass of flowers, covering all the rafters of the house. There were also collections of Ixoras, which are now scarcely found in Scotch gardens; Clerodendrons, Dieffenbachias, Strelitzia Reginæ, Pancratiums, and numerous other useful decorative plants, filled this house. In others there were Dracænas for room decoration, and Eucharis amazonia in fine health. There are houses set apart for Azaleas, Epacris, Rhododendrons, and Heaths, which complete three sides of a square. Besides all these, there are numerous pits for the hundred-and-one plants now grown, viz., Poinsettias and Callas. Carnation Keir Prince, a capital variety for winter work, was present in large numbers in full flower; the colour is a glowing scarlet. Many other objects arrested attention, but I had still to see the pleasure-grounds of 50 acres in area and so could not take notes of them. Much of it is wild gardening, and this method of gardening is encouraged by Mr. Stirling Maxwell. A Japanese garden is mooted, and a herbaceous garden is already planted.

There are many features in the garden which space forbids anything more than a bare mention of here. A bowling green enclosed by a golden Holly hedge; golden Yews grafted on the sombre English Yew are arranged sentinel-like, which shows off the bright yellow; and innumerable fine specimens of Conifers, and avenues and lines of Pines and Cupressus. More than a hundred vases for flowers or shrubs, and much ornamental masonry are in close proximity to the house. The garden is at the west front of the house. In the front of a Yew temple is to be seen one of the finest Larches in the North, which, at 5 feet from the ground, is 12 feet 8 inches in girth of bole. A Spanish Chestnut by the mansion, on the terrace, is 24 feet in girth at 4 feet from the ground. A Cupressus macrocarpa, near the house, is about 50 feet high; Abies grandis is 50 feet high; the largest tree of Cryptomeria japonica in Britain; an Abies Douglasii 10 feet in girth, 5 feet from the ground; A. morinda 45 feet high; A. Menziesi, 65 feet high; Pinus insignis, 55 feet; Abies nobilis, 78 feet; another Cryptomeria japonica, 75 feet, and 24 feet through the branches, which are feathered to the ground; and Juniperus recurva, 30 feet through at 3 feet high. *M. Temple.*

NEW OR NOTEWORTHY PLANTS.

EUCHARIS LOWII, *Baker, n. sp.**

This very fine Eucharis was imported by Messrs. Hugh Low & Co. from New Granada amongst a quantity of E. Sanderi. The flower is pure white, and, as will be seen from the dimensions given in the description, is quite as large as in the finest forms of E. grandiflora. From that it differs by having the tube of united bases of the filaments entirely adnate to the tube of the perianth, with only the six broad emarginate lobes free above its throat. It comes in between E. grandiflora and Sanderi, and may perhaps prove to be a hybrid between these two species, but at anyrate, it is a plant of great horticultural merit. It was exhibited at the Drill Hall show of the Royal Horticultural Society on April 11.

Bulb like that of E. grandiflora, but the neck rather thicker; petiole about 1 foot long; blade ovate-oblong, subcordate, 8 to 9 inches long at the flowering time, abruptly acuminate; peduncle nearly 2 feet long; umbel two-flowered; pedicels very short; spathe-valves linear-oblong, 1½ inch long; ovary oblong, ½ inch long; perianth with a curved tube nearly 3 inches long, nearly 1 inch in diameter at the throat; expanded limb 4 inches in diameter; segments oblong, spreading, 2 inches long, above 1 inch broad; tube of the united filaments entirely adnate to the throat of the perianth, with six vertical green stripes below the filaments, and six erect broad emarginate lobes not more than ⅛ inch long; free part of filament ½ inch long; anthers small, linear; stigma overtopping the anthers. (See fig. 78, p. 539.) *J. G. Baker, Herbarium, Kew.*

TULIPA CONCINNA, *Baker, n. sp.*†

This is another of the new plants recently discovered by Mr. Whittall's collectors in the western Taurus. For the specimens from which my description is taken I am indebted to Messrs. Barr & Sons, with whom it has flowered at Long Ditton early in April. It is allied to T. undulatifolia, ciliata and T. Dammanni, Regel, *Gartenflora*, t. 1300, fig. 2.

Bulb ovoid, under an inch in diameter; tunics brown, membranous, not at all woolly inside; stem a span long, with four glaucous leaves, with obscurely-ciliated undulated edges, aggregated near its base, the lowest 5 to six inches long, under an inch broad; peduncle glabrous, 2 to 3 inches long; perianth campanulate, crimson, 1¼ inch long; segments, uniform, ovate, obtuse, with a minute mucro, with an obscure purple-black blotch at the base, without any yellow border; stamens half as long as the perianth; filaments as long as the anther, purple-black, with a yellow tip, glabrous at the base; ovary shorter than the stamens; stigmas small. *J. G. Baker.*

FRITILLARIA (AMBLIRION) CITRINA, *Baker, n. sp.*‡

For the specimens of this very distinct new species of Fritillaria, I am indebted to Messrs. Dammann of Naples. Mr. Sprenger tells me they have received it both from the Taurus and from Greece, that the specimen sent to me came from the Taurus, whence they have imported it in quantity, and that the Greek plant only differs by flowering

* *Eucharis Lowii*, Baker, n. sp.—Bulbo globoso, foliis ovato-oblongis subcordatis longe petiolatis; umbellis bifloris, pedicellis brevissimis; perianthio tubo arcuato tripollicari fauce late infundibulari; segmentis oblongis patulis imbricatis, filamentorum tubo omnino adnato striis 6 viridibus percurso; segmentis liberis brevibus latis emarginatis erectis; filamentis liberis brevibus.

† *Tulipa concinna*, Baker, n. sp.— Bulbo parvo ovideo tunicis intus haud lanatis; caule spithaemæo unifloris, foliis 4 confertis glaucescentibus margine subundulatis inferioribus lanceolatis; perianthio campanulato coccineo; segmentis ovatis obtusis conformibus minute mucronatis basi intus obscure nigro maculatis; staminibus perianthii duplo brevioribus; filamentis glabris; ovario cylindrico, stigmatibus parvis.

‡ *Fritillaria* (*Amblirion*) *citrina*, Baker, n. sp.—Caule gracili elongato tricephalo; foliis pluribus linearibus parvis alternis; perianthio oblongo pallide luteo; segmentis oblanceolato-oblongis, interioribus basi foveolis 2 obscuris brunneis pereditis, staminibus perianthio duplo brevioribus, stylo integro; ovario æquilongo.

a little earlier. The flowering takes place, at Naples, early in April. It belongs to the small group of Fritillarias characterised by an entire, not trifid style, and in this group it is marked by its numerous alternate linear leaves and oblong yellow flowers, which show no trace of tesselation, either inside or outside.

Bulb not seen; stem nearly a foot long, erect, slender, three-headed; leaves, about 20, linear, alternate all down the stem, slightly glaucous, with a

AZALEA VASEYI.

This is one of the latest and most promising additions made to the deciduous section of Azaleas, but it is, as yet, scarcely known outside nurseries and botanic gardens. That it will prove a valuable adjunct to the early-flowering group of hardy Azaleas is evident from several small plants now in bloom in the Azalea garden at Kew. These were raised from seeds two or three years ago, and although no more than 1 foot high, are already flowering very freely, well adapted for grouping in beds. A soil consisting of two parts rather light loam to one of peat, evidently meets its requirements. *W. J. B.*

FOREIGN CORRESPONDENCE.

LEMON-GROWING AT SANTA PAULA.

WE extract the following paragraphs relating to Lemon-growing at Santa Paula from the letter of a private correspondent, as we think that they will be read with interest. Our informant, writing under date of January 21, says:—"We have been busy for the last three weeks picking Lemons, washing, wrapping in paper, and storing them away in the curing-house; we have been through the orchard three times, each time with a different sized ring. Three men work on a row of trees, taking one at a time, one man picks all round the bottom and centre, another does the middle on a step-ladder, and the third picks the top of the tree with a ladder about 15 feet high fastened on a frame with wheels; all

FIG. 78.—EUCHARIS LOWII: FLOWERS PURE WHITE. (SEE P. 538.)

channelled face, ascending, the largest 2 to 2½ inches long, ¼ inch broad; peduncles cernuous at the apex, 2 to 3 inches long, bearing a single leaf at the middle; perianth oblong, an inch long, yellow, quite untesselated; segments connivent, oblanceolate-oblong, obtuse, pale yellow, the outer ¼ inch broad, slightly tinged with green on the back, the inner rather brighter in colour, with two obscure brown spots at the base; stamens half as long as the perianth; filaments pubescent, rather longer than the

The species was first described by Asa Gray, and a figure of it appears in *Garden and Forest*, October 3, 1888. It is a native of North Carolina. The flowers are borne on leafless wood this year, but in some seasons the foliage and flowers expand together. The corolla is nearly 2 inches across, divided into five oblong segments of a clear pale rose colour. The leaves are 2 to 3 inches long, oblanceolate, and pointed. In a wild state this species is described as attaining a height of 15 to 18 feet, and must therefore form a beautiful object when in full bloom. The horti-

2¼ or 2⅛ inch in diameter as the case may be in one hand and a pair of clippers in the other, and none but those which will not pass through the ring are to be cut; bags are slung over our shoulders wherein to place the Lemons, and as soon as these are full we carefully empty them into boxes scattered over the orchard. I am the box-foreman, and have to see to the proper distribution of the boxes, also that they are not too full, otherwise they would get bruised and rot, for the Lemon is so delicate that if handled more severely than an egg the skin is liable to get abraded, the essential oil evaporates, and the Lemon will not cure. The chief drawback to the fruit is that the most important picking is in the winter and early spring, and the market is not, of course, open until the summer; in the meantime the Lemons must be preserved. The management of their curing in this country is at present very crude. The Lemons here are hauled up to the packing-house, then sorted into several grades, those 'smutty' or dirty in any way first being washed in tubs of tepid water; they are then roughly wrapped in tissue paper, placed in shallow wooden trays, and stacked one above the other in the curing-house. They are carefully examined every few weeks, and all showing a tendency to decay are thrown away. The Lemons are picked monthly throughout the year, but the present is the most important crop. The April-May bloom yields the true or normal Lemon, the February, March, June, and July the abnormal or 'bastard'; the first-named cures the best. More than 1000 dollars (according to present exchange £206 5*s*.), is made a year off this 11-acre orchard of 20-year old trees, mostly Eurekas and Lisbons which are considered the two best varieties here; 8 dollars (£1 13*s*.) per box of 300 Lemons is sometimes paid here in the mid-summer.

"The best stock for 'budding' on, is considered by most orchardists to be the 'Florida sour stock,' or wild Orange, as it makes a strong growth, and is less liable to 'gum,' and other diseases. The great enemies of the trees here are the black and barnacle scales, but these can be kept down by the caustic soda spray.

"The Lemons in this State are not, in my opinion, nearly so good as those raised in Sicily, but a good deal to do with that is the 'crudeness' of the soil, want of judgment in the selection of the stocks, and location of the orchard. The Lemon to be grown to perfection must be planted on a sunny slope, that looking towards the south is best, at an elevation of from 500 to 1000 feet, within 5 or 6 miles of the sea, in a situation free from wind and frost, on a well-drained sandy loamy soil, and last, but not least, plenty of water, for 'water is king' in California.

"From what I have read and heard, the 'Mesas' or table-lands of San Diego country embody to a near extent all these requirements; this country is in the extreme south of California, and the land must be nearly synonymous with the slopes of Mount Etna, where the finest Lemons in the world are raised. Most of the orchards here are protected by wind-breaks, as we frequently have high winds; three or four rows of Blue Gums (Eucalyptus), and one of Pepper Trees make the best protection; Cypresses are also good. I maintain that a Lemon-orchard is the best investment there is in California; it is a perpetual source of income. I have learnt a great deal about the fruit since I came here, and am still learning.

"We shall not commence picking the Oranges until May, as the fruit ripens here so much later than that of Florida. There are several Washington Marvel (an early variety) already ripe enough for eating, so I am sucking Oranges all day long. Mr. X. is going to build a new house, as his present one is very unpretentious, both as to architecture and accommodation. I graded and prepared a large lawn in front of the site of the new building soon after I came here. I have only had to sit up six nights it only went down to freezing point twice out of the six times, and even then not lasting long enough to necessitate lighting the pots of oil in the orchard. . . . . *H. W. C.*"

Orchid Notes and Gleanings.

ORCHIDS AT BURFORD LODGE.

The fine collection of Sir Trevor Lawrence, Bart., M.P., is one of the most complete in the world, replete in the showiest, as well as the more curious, species of botanical interest. Among the latter we may mention the Cirrhopetalums and Bulbophyllums, of which there is a fine collection. Of the first-named, C. Mastersianum, with flowers of a rich Indian red, is very showy; C. picturatum and C. setiferum, one of the stateliest as well as new; C. O'Brienianum; Bulbophyllum Sillemianum, a clear yellow flower; the large and singular-looking B. grandiflorum, and the curious B. barbigerum, whose feather-like labellum is capable of motion, causing a feeling of wonder in those who have no knowledge of the structure and uses of its flowers. Among other singular species in flower at Burford are Stauropsis (Trichoglottis) fasciata, with its singular pairs of flowers; Cleisostoma crassifolium, with a large head of bloom; two varieties of Vanda cristata, the one large and showy, the other much smaller, and so dissimilar as to offer some excuse for the name V. striata, which was given to one of these forms despite the want of structural difference. In every house there are novel and curious species, the Epidendrums being specially prominent. The last addition, the curious dwarf-growing E. organense, has reddish-orange-coloured flowers, which some persons would take to be disproportionately large for so small a plant. It will be interesting to some of our readers to be informed that a plant of Vanilla is showing bloom, and that it is hoped that the giant Renanthera coccinea will again flower. This is the oldest authenticated Orchid in cultivation, and this particular plant is vouched for as having been in cultivation in England nearly eighty years. The blooming of many of the showy Orchids is being retarded as far as possible in view of the coming Temple Show, but so early is the flowering season that many which might be reckoned on in other years will this year be past their best before that event, retard them how they may. The fine plants of Cattleya Lawrenceana are now fully in bloom, as also the varieties of C. Mendelii, except those which have already passed; the C. Schroderæ, Lælia purpurata, and some other Lælias are also in flower, and many of the showy Cypripediums are in bloom, but a still greater number are coming. Cypripedium Lawrenceanum still holds its own as a handsome flower, and the hybrids between it and C. concolor and C. bellatulum which have been raised here are very beautiful. The Masdevallias are in perfection, and the house is filled with plants whose numerous fresh-expanded flowers of the varieties of M. Harryana, M. ignea, M. Veitchii, &c., make a fine sight. Masdevallia Harryana luteo-oculata is a brilliant variety; M. ignea Boddaertii, a fine flat flower, of a cherry-red hue; a plant of M. Arminii had about seventy crimson flowers, and was a fine object. M. Gelengiana ×, M. Mundyana ×, M. Hincksiana ×, M. Estrada-xanthina ×, and other hybrids were fully in bloom. A very promising cross is M. Shuttleworthii × Harryana, raised at Burford.

In the house of Phalænopsis were a few Phalænopsis in flower, a grand show of flower-spikes on some Vanda teres were noted; a noble lot of Habenaria militaris, which here grow very freely; a grandly-flowered Cœlogyne asperata (Lowii); the curious Luisia volucris, with horn-like petals, and a lip which curiously clips the stem of the plant at the tip; and as the stem bears resemblance to the labellum of the flower in regard to its colour, an ascending insect would pass up the labellum of the flowers, and fertilise some of them in the ordinary course of its promenade, without making a search for food, the

In the cool Odontoglossum-house were some plants of O. crispum, O. excellens, O. ramosissimum, and other species, in flower; and here the charming scarlet Lælia monophylla and Cochloida Noezliana grow well.

Other species and varieties in bloom were Epidendrum O'Brienianum, which grows to large proportions at Burford, the largest plant there being over 8 feet in height, and bore large heads of Cherry-red flowers; E. evectum, the elegant white and very fragrant Dendrobium linguæforme, D. Devonianum candidulum, D. transparens, D. dixanthum, D. Jenkinsii, D. Lowii, D. fimbriatum oculatum; a number of Odontoglossum citrosmum, a fine specimen of Vanda Denisoniana, with six spikes of white flower; a rich ruby-red form of Aërides Savageanum; the beautiful hybrid Cypripedium Fraseri and C. Rothschildianum, of large size; Cattleya Skinnerii alba, the curious C. fimbriata ×, Stelis muscifera, and a number of fine Miltonia vexillaria in bud.

In the Anthurium-house was the most brilliant, varied, and novel lot of varieties of Anthurium we have ever seen, chiefly home raised, and with which Mr. W. Bain, the gardener at Burford, takes as much pains as Mr. W. H. White does with the Orchids.

APPLE-TREE PESTS IN FRANCE.

Reporting on the trade of Caen for 1892, the British Vice-Consul makes some comments on the diseases by which the Apple is frequently attacked, and remarks that the crop for 1892, which promised well, was much decreased by myriads of caterpillars and other insects that invaded the orchards, attacking all garden fruits, so that the trees were completely denuded of their leaves.

The cultivation of the Apple tree, it is stated, is one of the greatest importance in the department, and it becomes each year less productive, even the actual existence of the trees is imperilled by the inroads of parasitical insects, the most destructive of the pests being a weevil or small beetle with a long proboscis, a familar acquaintance with all farmers. The insect secretes itself in the fissures of the bark of the tree during the winter months, and may also be found buried in the dry leaves and grasses about the foot of the tree. In the spring-time the insect climbs the trunk, and commences operations, the female piercing the envelope of the button of the half-formed blossom, and therein deposits her eggs, in time producing a white grub that devours the interior organism of the flower, but respects the thin envelope, receiving it as a shelter. The insect disappears during the summer months from the orchards, and turns its attention to the farmers' cornfields; this insect is described as the Cheimatobia brumata, the winter moth. Another pest (Mytilaspes pomarum), an inveterate enemy to the orchard, is a green caterpillar, with a black head, and is a rapid mover. This destructive creature not only devours the blossom, but strips the tree of its leaves, and if not destroyed, soon kills the tree.

The preventive means adopted is said to be by spreading strong brown paper over with a mixture of bird-lime and red vaseline, bands of which are made to encircle the fruit trees about 2 yards from the ground; this forms a barrier to the female insects in their ascent of the tree at breeding-time. Another most destructive insect, and a new arrival in the department of Calvados, but which has already committed ravages in the canton of St. Pierre-sur-Dives, is a species of cochineal that attacks the newly-planted Apple tree. The insect attaches itself to the bark of the tree, and the female deposits its eggs beneath a small button? These eggs hatch in May into minute white insects, thirty or forty in number. They spread gradually over the branches, penetrating the bark, and in time, exhaust the vitality of the tree. The authorities direct each

are posted abroad. The observance of the order is the exception, not the rule. Notification is yearly given by the municipal authorities that all the proper precautions shall be taken by farmers and others, and that these destructive insects in their orchards shall be destroyed, and any information as to the agencies to be employed in this necessary work can always be obtained through observations that have been made as to the habits of the numerous species of insects.

bedding is still a strong feature at Cliveden, and a walk round the grounds will show that this department has not suffered in the hands of Mr. Nisbet, the present able gardener and estate manager. The bright weather of the past month brought on outdoor flowering plants of all kinds wonderfully fast, for although the nights were cold, the day warmth was almost summery, and the spring flower-garden consequently is unusually gay.

The prettiest piece of bedding now at Cliveden is that seen below the terrace, where a border, long and broad, of Vandyke collar-like shape, is backed by creepers on the wall. This border is raised 1 foot or more above the adjacent ground level, and faced with Ivy. At the front of it is a broad band of Aubrietias, a seedling of the A. Hendersoni type, furnishing a wealth of flowers; then a wide belt of Viola Yellow Prince Improved, with circles of V. Cliveden Purple dotted about it, and a backing of V. Skylark and lines of yellow and dark brown Wallflowers. The large beds away in the front of the mansion are gay with Tulips. Eight beds are filled with these, about 3000 bulbs being set out in each, on a groundwork of Violas and other plants to bloom later, and continue the display until after the Ascot week. A large circular bed is planted with many thousands of Silene pendula, which will give a mass of colour later when required. Violas are used in immense numbers, the favourite varieties being Skylark, Yellow Prince Improved, and Cliveden Purple. Large low vases stand on either side of a broad walk below the terrace, which are filled with dark brown Wallflowers, a narrow border which encircles each being planted with yellow Wallflowers, the whole having a very good effect.

On the terrace wall Clematis montana and the Lilac bushes close by are in full flower. In the herbaceous garden the Doronicums are very showy, especially the variety Harpur Crewe, and a large collection of Daffodils have yielded a mass of flowers, Sir Watkin, Princess Mary, Leedsii, and N. poeticus ornatus standing out conspicuously among others. In the glass department neatness and order are observable, and fruit and plants are well grown. Peaches and Nectarines in the earliest-house have stoned, and are now swelling freely a heavy crop. A house about 40 feet in length is furnished by one tree of Royal George Peach, a fine specimen loaded with fruit, many of which will yet be removed. Another, a smaller house, is filled by a tree of the Dymond Peach variety, excellent for forcing or outdoor culture. A tree of Sea Eagle, formerly occupied the place filled by Dymond, but the fruits were woolly and insipid. Trees in later houses are carrying heavy crops of fruits. In the early vinery

Fig. 79.—CLIVEDEN: RECENTLY PURCHASED FROM THE DUKE OF WESTMINSTER, BY MR. ASTOR OF NEW YORK.

(THE TERRACE FRONT AS IT APPEARED IN 1877.)

CLIVEDEN.

The purchase of this beautiful Thames-side estate by Mr. Astor, the American millionaire, from the Duke of Westminster, has drawn general attention to the place. The situation of Cliveden is charming, commanding as it does views of the river Thames and the surrounding country from a considerable elevation. The mansion itself is a majestic pile, erected by the then Duke of Sutherland from designs by Barry in 1849. A new wing has recently been added by the Duke of Westminster, and various improvements carried out, including a high pressure water supply for the gardens and pleasure grounds. The late Mr. Fleming, as many of the readers of these lines will remember, made the spring and early summer gardening at Cliveden famous. Spring

the Grapes are swelling fast, and the Vines in grand health, as are those in the succession vineries. A large number of Spiræa astilboides is coming into flower, also Dendrobiums, Roses, and Carnations. The pleasure grounds and estate generally appear to be in excellent order everywhere. The estate passes from the present owner in August next, when Mr. Astor, who has been in tenancy the past three months, takes possession. *H. D.*

PLUM AND WALNUT CROPS IN FRANCE.

It is stated that the French Plum crop at Bordeaux in 1892 was below the average yield, being about 20 per cent. smaller than that of the year 1891. The Californian Plum crop having been one-third less than in 1891, and last year's Apple crop having likewise been small, there was a certain demand for French Plums from the United States in spite of their high prices, but by far the larger proportion was consumed in France itself. The quality of the 1892 crop was remarkably fine. Walnuts, it seems, were an abundant crop last year, and there was a large demand for them from foreign countries, the average price for good quality was maintained during the autumn shipping season at 19*s.* per cwt. Several thousand bags of "Cornes de Mouton" Walnuts, which had been rejected on arrival at Bordeaux as insufficiently dry, and afterwards stored in warehouse, were eventually cleared off at 11*s.* per cwt., leaving a loss to inland packers. The trade in Walnut kernels is increasing, some 5000 cases having been ordered at Bordeaux by New York and Chicago importers. *J. R. Jackson, Museum, Kew.*

MARKET GARDENING UNDER GLASS.

(*Continued from p.* 517.)

Messrs. Burton & Sons, Bexley Heath.

Although Messrs. Burton & Sons are known chiefly as horticultural engineers, many fruit growers about London have heard of the Peaches produced at this establishment in the Erith Road, Bexley Heath. Not many are more successful with Peaches than is Mr. Burton, and finer samples than were exhibited by him at a meeting of the Royal Horticultural Society at the Drill Hall last autumn, it would be difficult to find. At the time of our visit, many of the trees were covered with blossom, and the rest of the trees had set their fruits. Mr. Burton's happy experience is that he never finds any difficulty in procuring a good "set" even on his earliest trees, and he does not know what it is to sustain a failure of crop. A tree of Sea Eagle, which was bought and planted in 1890, was cropped to the extent of twenty-three fruits the same year, in 1891 it had sixty-two, last year it had ninety-eight, and it is expected to carry 130 during the present season. Such cropping as this would be thought by many gardeners to be injudicious, and we confess that it would appear so to ourselves, did we not know that the tree in question is making good wood, and exhibits the highest degree of health. The tree, when planted, was about 2 years old. Maidens are not bought. Mr. Burton sent to market during last year as many as 1200 dozen Peaches, and they were grown in two houses. One of these is a beautiful span-roof, 220 feet long, 10 feet high, and 13 feet wide. Houses are not arranged for succession, but the varieties contained in the one house are so selected that the supply covers a period of from four to six months. An unusual feature is that known as the Standard-house, which was figured in these pages on May 3, 1890. It is 112 feet long, 15 feet high, and 24 feet wide, and the trees are growing perfectly as natural as are the Plums outside. This system is believed to be quite as profitable as the orthodox trellis, and to the visitor it is a pleasant change from that method. Mr. Burton is glad to welcome anyone who goes to see his Peaches, of which he is more than a little proud, and those who may be pilgrims during the season, when the fruits will be swelled to such surprising size as they attain here, will not complain that their time has been badly spent. In the long span-roofed house were the following varieties, amongst others:—Peaches; Princess of Wales, Magdala, Mignonne Crosse, Rivers' Orange, Sea Eagle, Alexander, Abec, Early Rivers', Early Beatrice, Downton, Rivers' Early York, Hale's Early, Violette Hâtive, Stirling Castle, Gladstone, Noblesse, Royal George, and Goshawk. Nectarines; Humboldt, Lord Napier, and Pine Apple. The superior character of the houses in which the fruits are grown has, no doubt, a great influence in the success achieved, for both in the fall which has been given to the roof and in the system of ventilation obtaining, Mr. Burton's choice has been happy. Nothing else of consequence is grown for market, if we except a large batch of Adiantum cuneatum, and the yearly supply of Tomatos, which is usually about a ton and a half.

The Week's Work.

PLANTS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

GREENHOUSE PLANTS.—Plants of Aspidistra lurida and A. lurida variegata that are looking unhealthy from over-using, should be attended to, and if the pots are full of roots, and large plants are required, give a shift into a larger size, and place them in a warmer house, where they can be frequently syringed and encouraged to grow. Plants that have grown too large, may be broken up and potted into smaller pots. In this way they are often useful for baskets or table-work; they like good peat and loam in about equal parts, with a little rich manure and sand. Do not allow them to get dry at any time. They will stand in a cold room as long as most plants, but are kept in better health if placed in a good growing temperature at times.

ARAUCARIA EXCELSA.—This valuable plant for conservatory or house-work wants careful attention at the present time; mind the heads do not get broken, and avoid crowding them with other plants. They should be grown in various sizes, and are best kept in pairs when potting, afford them good turfy loam, with plenty of sharp sea-sand, good drainage, and abundance of air and water; they may be increased by cutting or by seeds.

ORANGE TREES.—Move into larger pots or tubs any of these that require it at once, give them good turfy loam and peat in about equal parts, with an addition of dry cow or sheep-dung, some small portion of sand and brick rubbish. They like plenty of drainage, and good supplies of water during the growing season, with frequent syringing. A little shade is beneficial—just after re-potting—to them in very bright weather, and they like abundance of air, but if they are placed out-of-doors during the summer months, it should be in a warm sheltered situation. They will do very well for a time if surrounded by other trees and shrubs to keep them warm. A cold terrace is the very worst place for them. They grow much better if kept in a house to themselves, and given a liberal treatment during the growing period. Thin out the fruit well, especially on small trees.

ROSES.—Tea-scented and other varieties that have done flowering should be well fumigated and washed with mildew destroyer, and during hot weather they may receive copious waterings with hose or engine, and abundance of manure-water at the roots; let the shoots grow as they like. Rêve d'Or and W. Allan Richardson have been very brilliant this spring, Cheshunt Hybrid is one of the sweetest and best dark Roses for planting out in conservatory or Rose-house.

CHRYSANTHEMUMS.—Attend to potting, do not let young plants get cramped in small pots. The bright weather has brought on the earlier-struck plants a little too fast, and if they are getting tall and are strong, take off the points and strike them in cold frames; better flowers will be obtained from the late-struck plants. Be careful that green-fly does not injure the shoots, if there are any present, fumigate, or syringe with Quassia-chips solution.

VIOLETS in frames should now be divided and planted out on a north border. Give plenty of rich manure. The best results are obtained from plants divided and planted at the end of April or beginning of May. Put them out in lines 1 foot apart and 6 inches between the plants.

THE ORCHID HOUSES.

By W. Holmes, *Gardener, Pickering Lodge, Timperley.*

ZYGOPETALUM MACKAYI, Z. CRINITUM, Z. MAXILLARE, Z. ROSTRATRUM, do well in any plant-stove, or on the north side of the Dendrobium-house; they are now making new roots and growths. If any are needing potting or surface-dressing it should be done forthwith, for if delayed the new roots will be far advanced, and being very brittle they easily get broken. A good compost for Z. crinitum and Mackayi, should consist of good fibrous loam and peat, with sphagnum moss in about equal parts, and a good sprinkling of broken crocks and coarse silver-sand well mixed together; they like copious supplies of water during the growing season, but the drainage must be good. Z. maxillare does much better grown in the Odontoglossum-house, and potted in good peat and moss, with plenty of crocks; they should be well elevated above the rim of the pots. Z. rostratum may be grown in the stove; it does well either on Tree Fern stems or potted like maxillare, but using very little material about their roots. The Fern stems are the best, as the long rhizomes soon get over the sides of the pot, and so have to be disturbed. Barkerias are best in the Mexican-house, and should be given every encouragement to grow. They are useful autumn-flowering Orchids, and if properly treated, will repay the trouble bestowed on them; they should be grown on rafts, with a fair amount of sphagnum moss, and well secured with copper-wire. When growing syringe them well morning and afternoon. The two best species are B. Lindleyana and B. Skinnerii. Keep a good look-out in the evenings for snails, cockroaches, woodlice and crickets, as these very soon find their way to the new fleshy roots.

THE PHALÆNOPSIS.—We are at the present time examining our entire stock of these plants, this being the most seasonable time to do this kind of work, the plants having mostly finished flowering, and new roots are beginning to form. Any that have not finished flowering will be benefited by having their flower-spikes cut off now. We have the following species:—P. amabilis, P. grandiflora, P. g. aurea, by far the finest, with sepals and petals broader than those of the typical grandiflora—it has also more of the yellow colour on the crest and throat; P. gloriosa, the "paper-white" species, a beautiful flower, worthy of a place in the most select collection; P. Luddemanniana, of which there are several forms, with much larger flowers, and finer in colour and markings than the type; P. leucorrhoda, a supposed natural hybrid between P. amabilis and P. Schilleriana, a supposition that is probably correct, as it partakes of the characteristics of both; P. Sanderiana is another fine species, which has the good attribute of a strong constitution; P. S. alba is a very fine variety, but it is as yet a scarce plant; P. Schilleriana is an easy plant to cultivate, and it comes into flower at a period generally when flowers are scarce, i.e., in the mid-winter; P. Stuartiana is another grand species, and one that is very distinct; P. violacea is a gem, but it is rather difficult to grow into a large plant, not unfrequently making only one leaf in the season, and has but few flowers on a spike, but it is a plant that is worth all the trouble it gives to grow it. The house these plants occupy is a span-roofed one, facing south, with top and bottom ventilators, and plenty of hot-water pipes in the house, which are never made very hot, and by so doing the air moisture is not dried up so quickly as it would be by very hot pipes. The plants are fastened to cylinders of Teak, and nothing but clean crocks and a small amount of fresh sphagnum moss, just sufficient to hold moisture, is put about the roots. The new roots creep down the sides of these cylinders, and being aërial, the atmosphere is kept very moist indeed whilst the period of growth lasts, that is, from the present time till November, damping down between the rows of plants, and keeping the stages and cylinders in a moist state. I never syringe Phalænopsis overhead, but the undersides of the leaves get the spray from the syringe, eradicating thrips and red-spider, which often harbour on the underside. Scale insects which sometimes

can be sponged off with tepid soft-water. The house is kept rather close for a time from this date until the plants begin to grow, when the ventilation is increased by degrees, and by the autumn the bottom ventilators are left open, unless north-easterly winds are blowing; in fact, it is safer to close them halfway whenever the wind is strong and cold, from whatever direction. During the summer-time, inside the house, temporary shading, such as is used for the blinds, is tacked up, the outer shading being scarcely thick enough in very bright weather. Teak is better than earthenware, as it seldom needs washing—an operation very often injurious to young roots, checking growth, and inducing bad health. The cylinders will last five or six years, and when decayed, it is best to transfer the plants into new ones, the new roots not being able to take a firm hold of the decayed wood. Phalænopsis may be well-grown without having a special house built for them—a plant-stove, or the Dendrobium-house will do; but they must have the shadiest part, and be hung up to the roof, or grown on a stage with plenty of moisture about them. The temperature should now be 70° at night, 75° to 80° by day, and a few degrees higher by sun-heat will do no harm.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

APRICOTS.—Where the pinching of young growths has not yet been attended to, the shoots will now be too hard to be easily pinched with the finger and thumb; but they may be cut back to three or four leaves, doing the work on a tree gradually, first by taking the strongest of the shoots, and at intervals those remaining. This is an important operation, and should receive early attention, or before the leaves at the base of the shoots become of a yellow colour in consequence of overcrowding, and unable to fulfil their functions in developing flower-buds.

CHERRIES, MORELLO.—Trees on walls with fruit set should have the shoots at the hinder part of the branches and where otherwise badly placed or crowded, cut away, and any foreright shoots pinched back to two or three leaves. Syringing with soapsuds and dilated tobacco-juice may commence directly black aphides are seen.

SWEET CHERRIES.—Although all the free-bearing Sweet Cherries, viz., Governor Wood, Cleveland Bigarreau, and Frogmore Early, repay for thinning the crop, that fine and likewise free-bearing variety Bigarreau Napoleon should have the same attention as soon as possible, no Cherry being more appreciated or more useful for dessert in its season than Bigarreau Napoleon. Governor Wood and Cleveland Bigarreau are such prolific varieties, that it is usually necessary to thin the crop to enable the trees to make good growth. Pinch or cut back breast-wood, and secure leading shoots, which will facilitate the keeping of the trees free from aphis previous to netting them, which must be done as soon as the fruit begins to colour.

WATERING AND MULCHING.—This is everywhere much needed. Apricots, Plums, Cherries, Peaches and Pears on the walls, also pyramid Pears and newly-planted and transplanted trees have been mulched and heavily watered here. Our water for garden use, coming from a pond, is warmed and softened, and therefore everything that I could wish. The Raspberries, and black Currants, and Strawberries will soon receive similar attention. Bush Apples need water, and to be mulched as soon as possible.

FRUITS UNDER GLASS.

By M. Temple, *Gardener, Carron House, Stirlingshire.*

PINES.—Now that the active growing season has arrived, it is a suitable period to arrange the whole stock of plants in pots. Those carrying fruit should have a compartment to themselves, or be placed at one end of the pit or house where they have to be ripened, and any that are showing fruit should come next, and so on, until the newly-potted suckers are farthest from the fruiting plants. Even in the early stages of growth, a distance of 2 feet apart at this season for good suckers of smooth Cayenne is not too much. A more liberal shift can be given now than at any other time, as growth is vigorous, and will remain so till October. Afford the plants water should not be potted when in a hard dry state. Pot into good turfy loam firmly, using only a little soot in the soil. Manure is better supplied from the surface or in liquid form, and only when there are abundance of active roots to assimilate the nourishment. A bottom-heat of 90° for fruiters should not be exceeded (the finest Queen Pine plants we ever saw was last year, they were grown on a stage without any bottom-heat), and 80° to 85° is enough for young growing plants.

VINES.—Those lately planted should be encouraged by heat and moisture until they are in active growth, then air should be allowed freely. When planting young Vines, let the soil be pure and not rich with manure next the young roots. Turfy-loam is very suitable, and they can afterwards be fed freely with the manures specially prepared for their requirements. Vines, which have fruited, should be stopped where they are to be cut back to at pruning season, and the laterals rather closely stopped, as growth proceeds to the apex of the house. Permanent Vines should have air and light over all the foliage, and be grown with moderate heat only, to prevent long-jointed watery wood. Inarching may be done when the wood of Vines is in the necessary condition. The two barks should be united evenly, and the slices removed may be from 3 to 5 inches long. Vines in pots to supply early Grapes should now be nearly full grown, stop them closely, and assist them to ripen early and well, in order to be rested by November.

PEACHES.—Where early fruits are ripening, it is a safe method to go over them every morning while dry and cool, and gather those fruits which will separate easily from the trees. Place them on paper shavings, dry moss, or wadding, with a sheet of clean paper next to them. Nets or straw placed to catch the dropping fruit is an old practice, but we never could be persuaded to adopt it, as we believe that Peaches are better when gathered under-ripe than at the falling stage. Syringing, watering, tying-in the wood, taking out all shoots not required on later trees, should be followed up. Let tobacco-powder be freely applied to wood and foliage if black aphis appears, and fumigate if necessary.

THE KITCHEN GARDEN.

By H. C. Prinsep, *Gardener, Buxted Park, Uckfield.*

RUNNER BEANS.—A full crop of this wholesome vegetable is seldom grown, owing to the seed being sown too thickly, or the Bean stakes so placed that the twining growth becomes entangled, thus preventing the foliage receiving its proper amount of light. If the seed is planted or sown so as to form a double row, a trench should be taken out 18 inches wide and two spits deep, and filled three parts full with rotted manure, and the remaining fourth with the soil. After this is made firm by trampling it, two drills 9 inches apart should be drawn, and the seeds put into these at 6 inches apart. It is good practice to put two seeds in a place for the early sowing, as the soil is sometimes not sufficiently warm to cause germination. This season, however, the soil is warmed to a considerable depth, and there is small fear of the seed decaying. When the plants have grown sufficiently to show which is the stronger, the weaker should be pulled up. Beans, being very tender, should have some protection till danger from frost is passed, or the first sowing may be cut off. If the soil is rich, and the weather warm, growth will be rapid, and to prevent the entanglement of the bine, the stakes should be put to the rows as soon as danger from frost is considered to be over. I prefer sticks of about 10 feet long, placed 1 foot apart on each side of the row, and about 3 inches from the plant, whose growths are tied with green rushes to the poles, so as to give them a start. In staking Beans, let them slant outwards, so that their tops are at least 3 feet apart. By so doing the light and air has the same opportunity in each row, the flowers setting more freely, and consequently producing a much larger yield than when the poles either cross each other or stand upright. It must be borne in mind, that in order to get the full benefit from such rows, the plants will require liberal treatment when in full bearing.

CELERY.—Owing to the abnormal heat, Celery plants have got very forward—even those sown late; and unless they can have plenty of room to grow, they will soon be spoiled. Where possible, the plants should be transferred to the trenches, but if space is limited, they may be transplanted before they get too large to a well-prepared piece of ground, whence they can be lifted, and if the soil is loose and rich they will lift freely when wanted for the trenches.

PEAS.—The early sowings in this district will be ready to pick in a few days, while those sown in pots and transplanted are far behind these. It is very interesting to watch the growth side by side of the different kinds. Continue to make sowings as fast as the previous sowing appears through the soil.

BRUSSELS SPROUTS.—Take advantage of the first warm shower to transplant those plants which were raised from seed sown at the beginning of April. When these have to be grown between the early rows of Potatos, the latter should be earthed-up, and the plants dibbled in the furrows, and if the sets are sufficiently wide apart in the rows, Brussels Sprout plants may be set between them; but if the rows are not more than 2 feet 6 inches distant, every other row only should be planted, as this will allow more room for the plants to grow sturdy, and Sprouts will be produced in greater abundance.

THE FLOWER GARDEN.

By T. H. Crasp, *Gardener, Canford Manor, Wimborne.*

ALPINE AURICULAS.—These beautiful spring flowers have of late years been much neglected, now, however, they are happily regaining to some extent the position they once held. Their cultivation is not difficult, but at the same time a few special points of treatment are necessary to grow them successfully. They are propagated easily by division or seed; the colours come fairly true, so that great variety may be obtained from one packet alone. Seed should now be sown in boxes of fine sandy soil, and if these are placed in a cool, shaded frame, germination will soon take place. Sow thinly, so that it will not be necessary to disturb the young seedlings until they get a good size, when they can be pricked off into fine rich soil on a half-shady border. If the old plants have finished blooming, they may now be divided, planting them in a shady part of the reserve garden, and a little deeper than they were before.

BEDDING-PLANTS.—If all such bedding-plants as Iresine, Coleus, Alternanthera, &c., are required in quantity, the propagation by cuttings can still be continued, even up till the middle of May. Every tiny top will root readily in heat, and if kept growing, good plants may be obtained by the time this class of plant can be safely put out in the open ground. If cuttings can be obtained in number, the quickest and best way is to make up a slight hot-bed with a surface of fine light soil, about 4 to 6 inches in depth, and faced over with sand. Dibble the cuttings into it a little wider apart than one would in boxes or pots, they will soon root if kept close, shaded, and uniformly moist, and after the usual hardening off, can be planted direct to the flower-beds. Coleus move best out of pots, and cuttings should then be potted up where possible.

Where the dry tubers of Begonias have not been started in heat, they could now be planted out in the open ground, provided it is prepared properly, and in a warm situation; they should be planted about 2 inches deep, dropping a little sand on each tuber afterwards, and giving them a good mulching of sifted leaf-soil, or cocoa-nut fibre. With this treatment the plants do not flower quite so early, at the same time beds of them look quite as well at the end of the season, and amply repay, especially where labour and room for starting purposes are a consideration.

FINE-FOLIAGED PLANTS.—These play an important part in the flower garden, and form capital reliefs to flowering plants, for which purpose such things as Cannas, Maize, Ricinus, Giant Hemp, &c., are very useful, and all can be raised from seed in a few weeks with the exception of the Cannas. The present time is not too late for sowing, and if after germination they are kept growing, they will make large enough plants for the purpose, in fact, better plants than those starved and stunted in pots. Should such plants be already raised and potted off, it is advisable to give a shift into a larger pot before the pots become too full of roots, for if checked in such a manner, it takes them some considerable time to recover themselves.

EDITORIAL NOTICES.

Letters for Publication.—*All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* written on one side only of the paper, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for contributions, or to return unused communications or illustrations, unless by special arrangement.*

Plants, &c., to be Named.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Illustrations.—*Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited; but the Editor cannot be responsible for loss or injury.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, May 9 — Royal Horticultural Society, Committees, at Drill Hall, James Street, Westminster. National Rose Society. Horticultural Club.

WEDNESDAY, May 10 — Royal Botanic Society, Musical Promenade. East Anglian Horticultural Club.

SHOWS.

WEDNESDAY, May 10 — Gloucester and Cheltenham Horticultural Society (two days), at Gloucester.

THURSDAY, May 11 — Crystal Palace Great Summer Show (two days).

SALES.

TUESDAY, May 9 — Sale of Imported Orchids at Protheroe & Morris' Rooms.

WEDNESDAY, May 10 — Palm Seeds from Brazil, Herbaceous Plants, Ferns, &c., at Protheroe & Morris' Rooms.

THURSDAY, May 11 — Bridgen Place Collection of Established Orchids at Protheroe & Morris' Rooms (two days).

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—53°.2.

The Wild Rabbit.

The rabbit is such a pest in gardens and plantations, that estate managers and gardeners should welcome the little book that Mr. Simpson, of Wortley, has lately published through Messrs. Blackwood & Son. Mr. Simpson's way of dealing with rabbits is not primarily to shoot, or to poison, or trap them, or to expose them to the attacks of their enemies, or to subject them to bacterial inoculations, all of which processes are more or less cruel, and might subject the practitioner to the anathemas of that well-meaning but very short-sighted and worse than mischievous body, known as the Anti-Vivisection Society.

Mr. Simpson's process is, we may say, more artful, and more practical than this. By the methods he inculcates, he minimises the mischief done by the furry marauders—he confines them to their own territory, which he makes so pleasant for them that they do not care to stray from it, and—he makes them "pay!" Mr. Simpson notes the utterly unscientific treatment of rabbit warrens in the past, and shows how landowners have been content to take everything out of their warrens and to put back nothing in return—a style of farming which, from one cause or another is unfortunately too prevalent, but which does not commend itself to the market gardeners who manage to turn the land to far greater advantage than the average farmer does. "Impoverishment," writes Mr. Simpson, "combined with a soured and tainted condition of the pasture, caused by want of lime, salt, and other dressings, is the whole secret of the matter." Flesh and blood and bone are constantly removed from the warren, nothing is added to it to compensate for the loss, and so the soil becomes exhausted, the rabbits diminish in weight and in numbers, they roam the neighbourhood in search of food, which they cannot get at home, and do mischief which is quite preventable. All this is good scientific reasoning, the practical deductions are obvious.

In the book before us, Mr. Simpson tells us how to do it, and, assuming the correctness of his figures, there is no doubt of the success of his operations commercially. The book is clearly, forcibly, and sensibly written, so much so that we are tempted to make many extracts from it, but we think it preferable to refrain from doing this, and to counsel those of our readers interested in the matter to study the argument for themselves, to note the carefully managed array of facts which the author gets together, the inductions based upon them, and lastly, the practical deductions derived from them. In contrast to this method of procedure, and as showing the necessity for that instruction in technical agriculture and horticulture which is now being inaugurated by many of our County Councils, we cite the following passage:—

"It is a fact that a very large number of farmers do not read agricultural papers, far less books. [To a less degree the same may be said of the rank and file of gardeners.] Farming traditions are mostly oral, an interchange of opinion on agricultural topics among themselves seldom extends further than the next market town or village. At such rendezvous, you may often meet farmers whose practice is the same to-day as their forefathers generations ago. I have met middle-aged farmers, tenants of over 150 acres, who acknowledged that they had never bought an agricultural paper, and never read one except by chance. And they was not exceptional examples, nor were they bad farmers as their class goes. In the villages where newsagents reside, the trade is mainly confined to the sensational local weekly papers among farmers and their hands who do read, and an agricultural sheet is a comparative rarity. The same apathy causes these farmers to absent themselves from the County Council agricultural lectures given in many places now, and attended chiefly by school-masters, their assistants, and others not practically connected with farming."

Whether it is good policy to recommend rabbit culture to allotment-holders is doubtful, unless all the neighbouring allottees co-operated in the management, and shared the proceeds.

Royal Horticultural Society.—The next display of flowers, fruit, &c., will take place on Tuesday, May 9, at the Drill Hall, James Street, Victoria Street, Westminster, and Prof. Cheshire will lecture on "How to Solve Chemical Questions concerning the Soil," at 3 p.m. The Temple Show on May 25 and 26 will intervene between this meeting and the next to be held at the Drill Hall on June 6.

Horticultural Club.—The usual monthly dinner and *conversazione* will take place on Tuesday, May 9, at 6 p.m., and the committee at 5 o'clock. The subject for discussion will be "Spring Gardening," to be opened by Mr. W. Ingram, of Belvoir Castle Gardens.

Hooker's "Icones Plantarum."—The last part issued in March is devoted entirely to descriptions and illustrations of Orchids, chiefly Indian and Malayan, and for the most part of botanical rather than of horticultural interest.

M. L. Linden.—We greatly regret to receive from this gentleman a protest against the unanimous decision of the jury at Ghent. We hoped that M. Linden would have continued to be actuated by the spirit which won him so much sympathy at Ghent. As the protest is addressed to the Society, we refrain from adding any further comment for the present.

Bournemouth and District Gardeners' Association.—On Wednesday evening, April 19, Miss Agnes C. Rooper, an honorary member of the Association, gave an interesting and suggestive lecture on "Some of the Reasons for the Effects which Air, Light, and Water, have on the Growth of Plants." At the conclusion of the lecture many questions were asked by members, and were answered fully by Miss Rooper, who was unanimously accorded a hearty vote of thanks.

"Report on Rust and Mildew on Wheat Plants."—A valuable report from the Board of Agriculture has been issued dealing with the subject of rust or mildew on Wheat plants. It is illustrated with coloured plates by Mr. W. G. Smith.

"Dictionnaire Pratique d'Horticulture."—The French translation of *Nicholson's Dictionary*, edited by M. S. Mottet, is indispensable to all who read French, as it is more complete than the original edition, and contains several additional features. It is issued in parts by Octave Doin, of Paris, and may be procured of any foreign bookseller.

Wild Mexican Potato.—The Cornell University *Agricultural Bulletin*, n. 49, records some experiments made with this plant, which is the Solanum tuberosum var. boreale—*alias* S. Fendleri. The tubers are brown, with deep eyes, and tend to be flattened. They keep well; the flesh is very yellow. When cooked the flavour is rich, and possesses a slight aroma which is not present in the common Potatos.

Russian Thistle.—The *Farmers' Bulletin*, No. 10, published by the United States Department of Agriculture, contains an account of this plant, described as one of the worst weeds ever introduced into the Wheat fields of America. Our botanical readers will not be surprised to hear that it is not a Thistle—popular names never err on the side of accuracy; but they will be interested in learning that the plant in question is Salsola Kali, a plant met with only near the sea coast in this country. It appears that it takes possession of the soil, and ousts everything else, whilst its spines render it specially objectionable to horses and other animals. In the pamphlet before us, the damage done in one year is estimated at 2,000,000 dollars in Dakota alone.

A Graft Hybrid.—The *Botanical Gazette* for March gives the following account of the method used in grafting by Mrs. Dixson (librarian of the University of Chicago), and of the graft hybrid which resulted from her experiment. She says:—"I took two strong healthy plants, one a pure white and one a pure red (single bloom Geraniums), and grafted them together at the root in length sections, using common grafting wax, and binding with long strips of flannel. The first year there was little accomplished except to keep the plant alive. In the fall I placed it in the sunniest corner of the room, with plenty of rich soil. It grew rapidly, and soon flowered profusely. At first there were red flowers, with blotches of white, sometimes one perfectly

white petal, and all of the others red. The second summer the two plants were fairly wedded into one life on conditions of absolute equality. The heads would show red and white flowers in almost equal proportion. I remember one cluster with three white flowers, two mottled ones, and the rest pure red. It lived for four years, and grew to be such a bush that it had to be trained against the porch-rail." At the time I saw the plant, the mixture of red and white was even more marked than the condition which Mrs. Dixson describes. One blossom had two red petals, and the rest white; another had some pure red, and the other mottled with white, &c. I could not discover that either plant seemed to have influenced the hybrid any more than the other one had. They were certainly fairly "wedded together." *Herbert L. Jones, Cambridge, Mass.*

Fig. 80.—view of keir house and terraces. (see p. 537.)

Transplantation of Large Trees.—We have lately received from Mr. Crasp, Lord Wimborne's gardener at Canford Manor, some notes of his method of removing big trees, which has met with great success, and also a photograph depicting a Weeping Ash tree, weighing with the soil attached 7 tons, and standing on a trolly ready for removal. This tree was transported a distance of 4 miles, and it cost in digging out and transplanting, including which the trees mostly stand. We do not reproduce the photograph kindly sent, as it merely represents a tree standing on a trolly, and several of these are needed to enable anyone to understand the whole work of excavating, supporting, loading, and removing these great masses of soil.

The Drought.—The urgent need for water in gardens and pleasure grounds in most districts has led Mr. C. J. Merryweather, head of the well-known firm of fire-engine manufacturers, to draw the attention of our readers to the use of fire-engines for watering crops, shrubs, &c. It is not generally known how suitable a fire-engine is for such work, being capable as it is of pumping water through great lengths of hose fitted with suitable nozzles, either a heavy shower or a fine spray being delivered, as may be desired. The present drought offers an opportunity for the trial of this method of moistening the soil, and Messrs. Merryweather inform us that they are ready to advise farmers and landowners on the subject, and lend the necessary apparatus on being given a few hours' notice.

Chislehurst and District Gardeners' Mutual Improvement Association. — The above body of horticulturists brought to a close a successful winter session by holding their annual social meeting at the Bull Hotel, Chislehurst, on the evening of Wednesday, April 26, when between sixty and seventy members and friends dined together. The president, Mr. Lyne, gardener at Foxbury, the hon. sec., and officers, have reason to be pleased with the doings of the past session, the following subjects having been taken up and discussed at various meetings held in the district, viz., Gardeners and Gardening, Zonal Pelargoniums, Celery and its Cultivation, Our Association, The Chrysanthemum, Ornamental Trees and Shrubs, Strawberry Culture, Carnations and Picotees, Poinsettias, Seakale, The Kitchen Garden, The Rose, Cyclamens, Eucharis amazonica, Madresfield Court Grape, The Violet, Asparagus, Tuberous Begonias, Mignonette, Herbaceous Calceolarias, and Melons. There has also been formed a circulating library

with books of reference on horticultural subjects, for the use of members.

MESSRS. BARR & SONS' TULIPS.—The florist's Tulips have made a magnificent display at the Long Ditton Nursery, Surbiton, but their season is likely to be not only an early but a short one. We do not remember to have seen Tulips in full bloom on the first day of May, as was the case this year, and if the weather continues dry the bloom cannot last much longer. Therefore, those wishing to see the old-fashioned Tulip as it used to be seen in the days of Groom and Goldham, should not delay visiting Messrs. BARR's collection. Every class of Tulip is represented, and the "breeders," that is, the self-coloured varieties, are in great force.

NATIONAL ROSE SOCIETY.—A meeting of the committee of the above will be held, by kind permission of the Horticultural Club, at their Rooms, Hotel Windsor, Victoria Street, Westminster, on Tuesday, the 9th inst., at 3 30 P.M.

ROSE SHOW FIXTURES IN 1893.—

June 22 (Thursday), Ryde.
" 28 (Wednesday), Earl's Court.
" 29 (Thursday), Newport and Windsor.
July 5 (Wednesday), Dursley.
" 11 (Tuesday), Harleston.
" 12 (Wednesday), Earl's Court.
" 21 (Friday), Ulverston.
" 25 (Tuesday), Tibshelf.
" 29 (Saturday), Bedale.

EDWARD MAWLEY, Rosebank, Berkhamsted, who kindly furnished the above, says, "I shall be glad to receive the dates of any Rose shows not mentioned, for publication in my next list of fixtures, which will be issued early in June."

THE SHROPSHIRE COUNTY COUNCIL.—At the quarterly meeting of the above body, on April 22, at Shrewsbury, it was stated, in the report of the Technical Instruction Committee, that Mr. ROBERT SMITH, F.R.H.S., is still lecturing to good audiences on horticultural subjects in different parts of the county, the Chairman bearing testimony to the signal success of the lectures.

"BOTANICAL MAGAZINE."—In the number for the present month, there are figured Gladiolus oppositiflorus, also figured and described in the *Gardeners' Chronicle* this year, March 11. Kniphofia modesta, a native of Natal and Griqualand, a plant with narrow leaves and small white flowers; raceme cylindrical, moderately dense, and 6 to 12 inches long. Allium cabulicum, a native of Kabul, bearing a dense, globose, many-flowered umbel; segments of blossom lanceolate, acute, whitish, with a keel of red-brown. Satyrium sphaerocarpum, a South African species near to S. militaris; flowers white, with carmine markings both inside and out. Veronica Colensoi, a New Zealand species, near to V. Traversii. It comes from the Ruabine Hills and the Alps of the Middle Island, from Nelson southwards at elevations of 3000 to 5000 feet. An evergreen of close habit, and with light blue flowers, it is likely to be a good rock-garden plant.

LAVENDER.—We learn from the *South Wales Daily News* that Lavender is now cultivated in South Australia. The plant was found growing in a swamp in the south of that colony [?], and was regarded as a nuisance by the settlers, as their cattle would not eat it. One of them, however, made inquiries, and discovered that it was Lavender. Acting on the advice of Mr. MOLYNEUX, Secretary to the Agricultural Bureau of South Australia, he has planted a considerable area of light, sandy soil having clay beneath it, and intends to distil the scent from it.

A FINE DENDROBIUM THYRSIFLORUM.—From the gardener at Totley Hall, Sheffield, we have recently received a photograph of a specimen of the above species bearing thirty-nine racemes of bloom. The plant showed fourteen more racemes, but these the gardener removed to save the plant from being unduly exhausted, or, in gardener's parlance, "flowered to death." The racemes measure 1 foot in length, with from sixty to seventy flowers on each. The plant has the same kind of treatment as D. nobile.

HORTICULTURAL CLUB.—A special dinner and *conversazione* were held at the Rooms of the Club, the Hotel Windsor, Victoria Street, Westminster, on Tuesday, April 25, when the chair was taken by Sir JOHN T. D. LLEWELYN, Bart., the Chairman of the Club. The especial feature of the meeting was to entertain Mons. HENRI CORREVON, of Geneva, who had delivered a lecture on "Alpine Plants" at the Royal Horticultural Society's meeting at the Drill Hall in the afternoon; but in addition several other gentlemen from abroad were present as guests—Mons. Frœbel, of Zurich; and the Messrs. Seidel, of Dresden. There were also present, of members and their friends, the Rev. W. Wilks, Dr. Power, and Messrs. Philip Crowley, Henry Seebohlm, H. J. Pearson, Geo. Monro, H. J. Veitch, Harry Turner, Edward Cockett, Harrison Weir, H. Selfe Leonard, J. Martin Smith, A. L. Wheeler, J. S. Cousens, &c. The tables were beautifully decorated with some grand masses of hybrid Rhododendrons, which the Chairman most kindly had sent from his gardens at Penllergare, South Wales, and which arrived in great freshness; while Mr. Webber, of Covent Garden, sent some specimens of Tasmanian Apples, and also a dish of English Ribston Pippins, grown to compare with the Tasmanians; it was generally conceded that although the foreigners looked well, in point of flavour they were generally inferior. The Chairman gave the toast of "the Queen, and the Visitors," to which Messrs. Seidel, Correvon, Power, and Seebohlm, responded. Mr. H. J. Veitch gave the toast of "the Club and its Secretary," who proposed that of "the Chairman," and a vote of thanks to him for his kindness in sending the flowers.

THE PROMISE OF THE FRUIT TREES.—From many and diverse parts of the country we hear of the most abundant bloom on fruit trees of all kinds, on the walls and in the orchard. Small fruits, Strawberries especially, seem to be full of promise, but the universal cry is for rain, and unless the welcome showers soon fall, the returns will falsify much of this abundant promise.

THE STOTT SPRAYERS.—Another meeting of fruit-growers and others took place on Lord SUDELEY's fruit farm, Toddington, on the 22nd ult., to still further test the efficacy of the various insecticides on the insects infesting fruit trees at this season. The various substances were declared by those present to have quite answered expectations, having killed caterpillars, red-spider, and aphides on either the first or second application.

BRESLAU.—Dr. PAX, lately of Berlin, has been appointed Professor of Botany and Director of the Botanic Garden, Breslau, in succession to the late Professor PRANTL.

MUNICH.—Dr. HEINRICH MAYR has been appointed Professor of Forestry in the University of Munich.

SYSTEMATIC BOTANY.—Mr. ALFRED W. BENNETT is about to give a course of lectures on Systematic Botany at St. Thomas' Hospital. The lectures will be given on Tuesday and Wednesday mornings, beginning on May 2, at 10 A.M., and will be illustrated by specimens. Tickets may be had from the Secretary to the Medical School, St. Thomas' Hospital, S.E.

CHICAGO.—At the World's Horticultural Congress, to be held in Chicago in August, papers are to be read on the following subjects:—Technical Horticultural Education, Relation of Experiment Stations to Commercial Horticulture, Horticulture in its General Relation to Art, and Improvement of Public Grounds (school-yards, cemeteries, highways, the development and preservation of natural beauty).

KENT COUNTY COUNCIL.—The Experiments Committee held a meeting at the Horticultural College, Swanley, on Thursday, April 13, and visited the land proposed to be used for experimental purposes. It was decided that the crop should be dwarf Beans, and the land to be divided into ten plots, each of which will be manured in a different manner.

THE CURRANT CROPS IN GREECE.—Reporting on the trade of the Morea for the year 1892, the British Consul says of the Currant crop, that the vineyards in the districts of Pyrgos, Olympia, Gastuni, and Zante, suffered from a severe attack of the "Peronosporos," by which the crop was reduced by about 40,000 to 50,000 tons. Almost all the Currant-growing districts of Greece were visited by this malady, but only in the above was the damage of any serious consequence. "This disease, which has at times caused such great damage to the vines in Italy, France, and elsewhere, is in appearance somewhat like the Oidium, and shows itself first in the form of a white blight or fungus on the leaves, which it partially destroys. It then attacks the bunches at the period when the fruit is just forming, and causes it to wither and drop off. Experts have recommended the powdering of the plants in the spring with a mixture of powdered sulphur, lime, and sulphate of iron, but the expense would be considerable, and it is, therefore, doubtful if the peasantry will have recourse to this preventive, although great fears are entertained of a recurrence of the malady in the spring." Some protection of British buyers against imposition in fraudulently stating one kind of Currant to be that of another, has been made by the Greek authorities. "By a law passed in July last by the Greek Chamber," it is stated that it is now a punishable offence to mark any package containing Currants for shipment to any foreign market with any name other than that of the district where they were produced. The British consumer can, therefore, now depend upon getting "Vostizza," "Gulf," or "Patras" Currants should he buy a package which has been so marked in Greece. Formerly, all kinds of rubbishy Currants grown on the western coast of the Morea were branded as Vostizza, Gulf, &c., in order to deceive foreign customers.

THE DIANTHUS.—In the part of the *Journal of the Linnean Society* recently issued, is a carefully-elaborated monograph of the species of Dianthus by Mr. F. N. WILLIAMS. The monograph is worked out exclusively from a botanical point of view, but it will be valuable for reference by the cultivator. Mr. WILLIAMS enumerates in all 238 species, of which he gives careful original descriptions, with references to the more important synomyns. A paragraph is devoted to hybrids, but Mr. WILLIAMS has not recalled the noteworthy fact that the first hybrid of any kind produced artificially was one between Dianthus caryophyllus and D. barbatus. This was known as Fairchild's Sweet William, after the name of the raiser, FAIRCHILD, of Hoxton. Whether what we now term mule pinks are descendants from this, we do not know. In any case the honour of having produced the first hybrid plant on record belongs to an English gardener. FAIRCHILD had a vineyard at Hoxton as late as 1722. He died in 1729, and made provision in his will for the annual delivery, in St. Leonard's Church, Shoreditch, of a sermon on "The wonderful works of GOD in creation, or on the certainty of the resurrection of the dead, proved by the certain changes of the animal and vegetable parts of creation."

AN OLD VARIETY OF POTATO.—We have received three small cut sets of Potatos from Mr. W. G. HOLMES, a seed merchant, of Tain, N.B. These bits of tubers seem to belong to a flattish heart-shaped, white-skinned variety, with white or very slightly empurpled buds. The skin is smooth, and the eyes or buds are scarcely depressed below it. The following note accompanied the tubers:—

growing wild for eighty years amongst the limestone rocks near Benmore, Ross-shire, on the property of Sir Charles Ross, Bart., of Balnagowan. I am informed by Mr. Graham, the gamekeeper at Rosehall, that these Potatos have probably been in the same spot for a century, and cultivated by shepherds, who occupied the place 100 years ago, but that there has been no person living there since 1814. I can say nothing at present as to the quality, or whether it is an early or late sort, but thought it might be of interest if these unregenerate octogenarians were favoured with an airing in the columns of the *Gardeners' Chronicle*." We will have these sets planted and tested, and identified, if possible.

Carnation Pride of Great Britain.—One of the finest, if not quite the finest, primrose-yellow coloured Carnation is the above-named novelty, a bloom of which has been sent us by Mr. T. Ware, of the Hale Farm Nurseries, Tottenham. The bloom is full, and of large size, 3 inches in width. It has one drawback for a Carnation, in that it is destitute of perfume.

Beaumontea grandiflora.—This splendid greenhouse or warm conservatory creeper is rarely found in abundant bloom, and, except in large houses, suitable places cannot be found for it. Like Stephanotis florabunda, it must have a considerable run for its roots, and have the wood well-ripened, if it is to flower satisfactorily. Mr. R. Maries, Mythop Nurseries, Lytham, sends us a fine head of flowers, cut from a plant growing in ordinary soil, in an intermediate-house, where it is trained along the roof close to the glass, fully exposed to sunshine. The plant was figured in the *Gardeners' Chronicle*, May 8, 1886, from materials furnished us by Mr. Ruffett, the then gardener to Earl Cowper, at Panshanger Park, Hertford.

Winter and Summer Spinach.—There has been much writing in this and other journals about the comparative hardiness of varieties of Spinach, and generally the writers have preferred what they have named the Round. The variety that we commonly grow under the name of Prickly Spinach comes nearest to the wild form of Spinacia oleracea, which has rather narrow-pointed, arrow-shaped leaves, the leaf-stalks of a reddish colour, and the seeds furnished with sharp prickles. When the cultivated variety of this species is well grown, it is furnished with spreading branches, well covered with leaves, and does not flower readily. The Round-seeded Spinach forms a rosette-like plant, from out of the centre of which the flower-stems issue. According to M. Vilmorin there is a Prickly-seeded variety with roundish leaves, which bears a tolerable resemblance to the Lettuce-leaved Spinach. It is clear then, he says, that of two varieties, which are equally good in other respects, the preference will always be given to the Round-seeded variety, the seed being more convenient to handle. It seems to follow, then, that what the gardeners say who have written about Round Winter Spinach does not apply to our old friend of summer cropping, which is the Round-seeded Flanders Spinach; or to the Round-seeded, round-leaved, large Dutch Spinach; but rather to the Prickly-seeded variety, with round leaves, above alluded to. Perhaps some of our correspondents in the trade could clear this matter up for the benefit of our readers.

Eucharis amazonica.—It is so seldom that we see a large number of Eucharis amazonica really well-grown, writes Mr. F. C. Edwards, that I have forwarded you a photograph of a houseful grown by Mr. McPherson, gardener to Lord Londesborough, Londesborough Park, Market Weighton. The roof of the house is covered with Asparagus plumosa nana, which makes a pleasing contrast to the snow-white flowers on the stagings below. When the photograph was taken, there were fifty-two pots of 12 inches in diameter, which produced 280 spikes of flowers and 1638 flowers. [The photograph alluded to presented an unusually fine lot of

Mr. E. Bennett.—There are doubtless many old friends of this esteemed gardener, formerly of Osberton, Enville, Hatfield, and more recently of Harefield Grove, who will be interested to learn that a few months since he entered into an engagement with the Board of Works for the tenancy for seven years of the extensive walled-in gardens at Hampton Court. These comprise some 15 acres, with a vast wall area, also a large number of vineries, peach and plant-houses, frames, &c. For some years these gardens were in the occupation of Messrs. Jackson & Sons, of Kingston-on-Thames; then they passed into other hands, and when Mr. Bennett took possession, not only was all the glass in a most dilapidated state, but the gardens were literally beds of Couch grass and other weeds. A man needed a stout heart who would undertake the regeneration of the place. Mr. Bennett seems to be the man for the purpose. He has secured the lease for a fairly moderate rental, has induced the Board of Works to put new hot-water piping into all the houses, to repair and paint them, and carry out many other needed repairs. He has also, so far as is possible, cleaned and cropped the greater portion of the ground, although it will take five years' hard work to do the whole area thoroughly. The Vines and Peach trees are all old, and badly need renovating. One good feature is the splendid fruit promise outside, and the neighbourhood of many excellent customers in the Palace inmates.

The Horse-Chestnut.—Although in such an immense length of trees on either side as the famous Chestnut avenue in Bushey Park presents, there must of necessity be much sameness, yet in spite of this, there is much variety; indeed, scores of trees show in habit of growth, in leafage, and in form or size of bloom-spike, so much diversity that the great interest attaches to seeing this avenue in the spring. This year the bloom has been most abundant, fine and beautiful, and has been admired by tens of thousands of visitors; indeed, on Sunday last, which seems to have been regarded as the usual Chestnut Sunday, although exceptionally early, the attendance of visitors was enormous, the weather continuing fine, although clouds tempered the sunshine.

John Ruskin Strawberry.—So well pleased is Mr. Gilman, the gardener at Ingestre Hall, Staffordshire, with this variety, that he intends to force 800 plants early next season.

Oxford Botanic Gardens.—We learn that the above will undergo some improvement by the renewal and increase of the glasshouses, a sum of £3500 having been voted by the University, the expenditure to be spread over three years. The gardens are held on lease of Magdalen College, and when this lease was granted in 1876, it was a stipulation that repairs, estimated then to cost £5580 should be executed, but of which sum only £2200 have been expended.

The Horticultural College, Swanley, Kent.—The Experiments Committee of the Kent County Council held a meeting at the Horticultural College, Swanley, on Thursday, April 28, at which Professor Cheshire gave an account of a method of growing Mushrooms, which he had found very successful. This system consists of making the bed up of alternate layers of earth and fresh manure, instead of the common method of forming the bed of a bulk of manure, with earth only on the surface. It had been found on trial at the College, that the crop was much larger under the former treatment, and the bed lasted longer. It was decided that sulphate of copper and lime should be again tried this season on the Potatos, as a preventive of the Potato disease. At the next meeting, May 11, it was decided that Professor Cheshire would give his views with regard to "The Economic Production of Nitrates on a Farm."

The Surveyors' Institution.—At the ordinary meeting, held on Monday, April 24, the adjourned discussion on the paper, read by Mr. T. Bright at the meeting of April 10, on "Underwoods, their Growth and Utilisation," was resumed and concluded; and a paper by Mr. R. F. Grantham (Associate), entitled "Recent Experience in Sewage Filtration considered in relation to River Pollution," was taken as read, with a view to its discussion at the next meeting.

Farewell at Kew.—A farewell dinner was held on the 26th ult. in honour of Mr. G. H. Krumbeigel, who has been appointed to Baroda, and of Mr. Willie, who has received an appointment to the Gold Coast. Mr. Hugh A. Pettigrew presided over a company of nearly fifty, and a very enjoyable evening was spent.

Publications Received.—*Town and Home Gardening*. By Mrs. T. Chamberlain. (J. S. Virtue & Co.)—*Agricultural Produce Statistics of Great Britain*. Board of Agriculture.—*North American Locusts, &c.* By Lawrence Bruner, Washington.—*Annual Report of the Fruit Growers' Association of Ontario.—Plant Atlas*. By Sebastian Kneipp. (Grevel & Co.)—*Poultry for Table and Market*. Tegetmeier. (*Field* Office.)—*Official Catalogue of the British Section, Chicago Exhibition*, 1893 (price 25 cents). London: W. Clowes & Sons, Limited, 13, Charing Cross, W.C.—*The Royal Botanic Gardens, Ceylon: Report of Dr. H. Trimen, Director.—Semer et Planter*, illustrated. Paris: S. Rothschild, 13, Rue des Saints-Pères.

PLANT PORTRAITS.

Acer nikoense, *Garden and Forest*, April 5.

Anthurium Andreanum var. Warnbeckeanum.—A white spathed variety, *Illust. Monatshefte*, February.

Apple, McMahan, *Canadian Horticulturist*, March.

Aristolochia gigantea (Martuet and Zuccarini). [Not to be confounded with A. gigas]. *Illustration Horticole*, t. 171—172.

Batemannia Colleyi, *Lindenia*, t. 365.

Cattleya Hardyana ×, *Reichenbachia*, t. 55. A natural hybrid between C. aurea and C. Warscewiczii, and manifesting great variation in colouring. It is one of the finest of all the Cattleyas. The segments of the flower are deep rosy-lilac, the lip rich crimson, with the base of a golden yellow streaked with crimson.

Cœlogyne Sanderæ, *Kränzlin*.—This species, which was figured in a recent issue was, we find, published simultaneously in *Reichenbachia*, t. 56, where a botanical description is given by Dr. Kränzlin. The species, say Messrs. Sander, should be grown in rough fibrous peat and sphagnum moss, suspended from the roof in pans or baskets in a temperature of 60° to 65° F., and should receive copious supplies of water when growing, and never be allowed to get dry, except to the extent of sweetening the material in which the plant is growing. The present plant is much injured by hard water, so that, as in the case of most Orchids, rain-water should be used. See also *Gardeners' Chronicle*, March 25, fig. 52.

Cornus Kousa.—A Japanese cornel, with oblong lanceolate leaves and starry white flowers, each about 3 inches across, and with four oblong acute white involucral bracts, *Garden*, February 26.

Cymbidium Lowianum.—Messrs. Sander, in *Reichenbachia*, recommend this plant to be grown in the best yellow loam, with a little clean coarse sand and charcoal in well-drained pots or pans. Copious waterings are necessary when the plant is in active growth, but care should be taken not to over-water newly potted plants, nor should they be plunged for any length of time, as this treatment is likely to cause the roots to rot and die.

ROUND GHENT.

(*Continued from p.* 515.)

M. Ed. Dereyghere van Coppenolle.

Scheepsdaele, Bruges, has an extensive and extremely well-built nursery, in which Palms, Aspidistras and other decorative plants are remarkably well-grown, the large and beautifully furnished plants of Latania borbonica being especially fine.

In one of the houses were some very neat little standards of the small-leafed Myrtle in pots. These are always neat and pretty objects, and they are still more so when in flower. Here standard and pyramid Sweet Bays are remarkably well grown, and may be found of all dimensions. It takes a long time to grow up fine specimens, and considering the amount of care necessary in their cultivation, it is a wonder how they can be sold at the price they are.

M. Henri Beernaert, Port d'Ostende, Bruges, next favoured us with a view of his establishment, which is happily situated for water, as it has a canal on each side of it, and the water of Bruges is a capital stimulant for plant-life, but scarcely good for man to consume. The new house of eight spans will form a fine addition to the nursery, and will doubtless quickly be filled with noble Palms similar to those which now occupy the eight-span house previously erected. In another block of houses the Kentias and Latanias are grand, and the large quantity of Cypripedium insigne are in fine health. In this house space is utilised, and a fine effect created by suspending all over it plants of Anthurium Scherzerianum, which are just now covered with brilliant spathes. Outside is a nice lot of variegated Phormiums, &c.

A slight détour enabled us to inspect the houses of M. Gaissée, Director of l'Horticulture Brugeoise, in the Rue Louis Fontcastle, which are filled chiefly with Latanias of excellent quality, and a fine lot of Chamærops and other Palms.

COCCIDÆ, OR SCALE INSECTS, WHICH LIVE ON ORCHIDS.

The scale-insects which occur on Orchids are numerous and interesting, but not sufficiently known. An imperfect search in the West Indies has already yielded some new forms; and if the Orchids which are annually received in Europe from all parts of the tropics were even casually examined for these insects, the results would probably be remarkable. Moved by a vision of much good entomological material going to waste, and hoping that some may be prompted to search for Orchid Coccidæ, I give herewith a few notes on those already known, fourteen in number. A few observed by myself are added, bringing the total number of Orchid Coccidæ up to eighteen.

The new species will be described more fully elsewhere later on.

1. *Dactylopius glaucus* (Maskell). Found in New Zealand on hothouse Orchids, and considered injurious. It also lives on a variety of other plants. The adult female is about one-fourteenth of an inch long, oval, green or brownish-red, segmented, covered with a thin mealy secretion. This is a "mealy-bug," not a scale-insect in the literal sense of the word.

2. *Prosopophora Dendrobii*, Douglas (fig. 81, 3).—Found in Demerara on Dendrobium Calceolaria, infesting the stems. The scale is brownish, oval in outline, slightly convex, with a median keel. Length about a quarter of an inch. The substance of the scale is waxy, and dissolves away on boiling in caustic potash.

3. *Vinsonia stellifera* (Westw.) (fig. 81, 2).—Easily recognised by its star-like shape. It was originally found on Cypripedium niveum, a Siamese species. In Jamaica it is common. Dr. Henderson gave me a leaf of Broughtonia sanguinea on which were twenty scales, all along the midrib of the under side. It is not confined to Orchids, being common on the Mango. Mr. C. A. Barber sent me many from St. Kitts, on Ardisia polycephala; and through Dr. Plaxton I received it on Cocoa-nut from Barbados.

4. *Ctenochiton elongatus* (Maskell).—Found on Dendrobium in New Zealand. The female scale is elongated, narrow, rounded at the ends, one-third of an inch or less in length. It is whitish, with a curious fringe.

5. *Lecanium hibernaculorum* (Targ).—Has been found on Phaius (cultivated) in Europe. The scale is about one-ninth of an inch in diameter, nearly globular, reddish-brown. It is very closely allied to the common brown scale, L. hemisphæricum.

6. *L. Angræci* (Boisd.)—Found on Angræcum sesquipedale from Madagascar. It has never been described, but is said to resemble L. cestri, which is a Pulvinaria, and L. filicum, which is allied to L. hibernaculaorum.

7. *L. hesperidum*, L.—The common flat scale, found on many kinds of plants in Europe, America, and New Zealand. It is yellowish-brown or brownish, flat, oval, about one-tenth of an inch long. Mr. Harris sent me what appears to be the young of this species, found on Stelis, at Cinchona, Jamaica.

8. *L. acuminatum*, Signoret.—Found on Orchidaceous plants in hothouses in France. It is like the last, but broader in proportion to its length, with a slight tendency to be triangular.

9. *Conchaspis Angræci* (Ckll.), n. g. and sp. (fig. 81, 1).—Found on a Madagascar Orchid, Angræcum eburneum var. virens, at Hope Gardens, Jamaica. The scale is small, circular at its base, pyramidal or low-conical, with the apex not central. Its colour is white. The insect itself might at first sight be taken for Diaspis, but its structure is very different, and the adult has legs.

10. *Planchonia Oncidii* (Ckll.), n. sp.—First found by Dr. Henderson on Oncidium tetrapetalum in Kingston, Jamaica, but it also infests Broughtonia sanguinea. The scale is minute, about the size and shape of a pin's head, bright yellow, with a pinkish fringe of little rods.

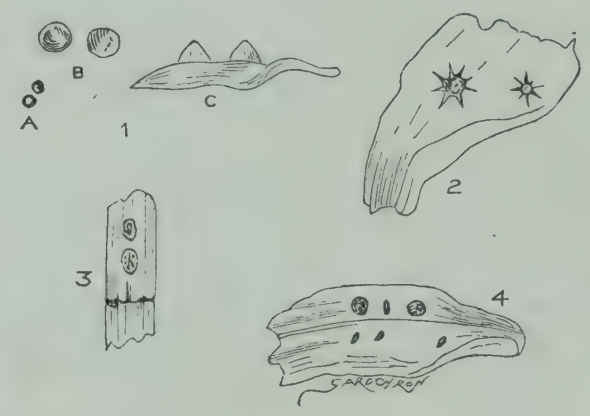

Fig. 81.—Orchid scale insects.

1, Conchaspis Angræci (Ckll.), A, natural size; B C, enlarged; B, from above; C, from the side 2, Vinsonia stellifera (Westw.). 3, Prosopophora Dendrobi (Dougl). 4, Aspidiotus biformis (Ckll).

11. *P. Epidendri* (Bouché sp.)—Found on Epidendrum cuspidatum; the scale is very small, depressed, greenish-yellow, the margin fringed or ciliated. It has never been sufficiently described.

12. *Aspidiotus biformis* (Ckll.), n. sp. (fig. 81, 4).—Found on an Orchid exhibited at a flower show at Kingston, Jamaica; afterwards received from Mr. Hart, who found it on Oncidium Sprucei in the Royal Botanic Gardens, Trinidad. The female scale is about 2 millim. across, broadly oval or circular, convex, brown-black, with the nipple-like exuviæ dark-red brown, and placed away from the centre. The surface of the scale is strongly granulose. The male scale is much smaller, and elongate with parallel sides, the exuviæ placed at one end. Conspicuous white patches are left when the scales are removed from the plant. The female, removed from the scale, is pale bluish, with the terminal segments yellowish. There are three pairs of lobes, the third or outermost pair being more or less rudimentary. A scale found on Cattleya Bowringiana at Hope Gardens, Jamaica, is very similar to A. biformis, but the exuviæ are black. A third form, the scales of which are crowded together and overlapping, was found by Dr. Henderson on Odontoglossum grande in Kingston, Jamaica. In this, the exuviæ are pale, but black when the coating of secretion is rubbed off. Provisionally, these Cattleya and Odontoglossum forms may be distinguished respectively as A. biformis var. Cattleyæ and var. Odontoglossi.

13. *A. Epidendri* (Bouché). — On Epidendrum in European hothouses, and on Orchids in hothouses in New Zealand. The female scale is about one-twelfth of an inch in diameter, circular, flat, dirty-white, or brownish. The male scale is elongated. This insect is allied to the common A. nerii.

14. *A. nerii* (Bouché).—Mr. Maskell states that this is found on hothouse Orchids. The scale is white, small, circular, with the orange-yellow exuviæ not covered by secretion, or at least, only the second-skin is covered.

15. *Aulacaspis Boisduvalii* (Sign).—Infests Orchids in European hothouses; and the same species, or a variety of it, has been found by Dr. Henderson in Kingston, Jamaica, on Oncidium tetrapetalum and Broughtonia sanguinea. The scale is white or pale-greyish, the exuviæ very pale straw-colour, and placed away from the centre, but not marginal. The male scale is elongate, and tricarinated, which distinguishes this at once from any Aspidiotus.

16. *A. Cymbidii* (Bouché).—Found on Cymbidium, and is apparently allied to the last. The exuviæ, judging from a figure in *Timehri*, are marginal. The male scale is tricarinate.

17. *Mytilaspis pinnæformis* (Bouché).—Found on Cymbidium in Europe. This is a mussel-scale, like the well-known M. pomorum of the Apple. The colour is light brown.

18. *Fiorinia stricta* (Maskell).—On Dendrobium in New Zealand. The female scale is elongated, narrow, with the sides almost parallel, length about one-eleventh of an inch. Its general colour is black, with some white secretion. The male scale is white, with the black exuviæ at one end; it is not keeled. *T. D. A. Cockerell, Curator of Museum, Institute of Jamaica, Kingston, Jamaica, January* 31, 1893.

FRUIT PROSPECTS.

As the unique weather-blend of drought, sunshine, and frost continues, it becomes more interesting to note how the fruit trees, now so rapidly whitening into the brilliant prospects of a full harvest, conduct themselves under their rare experience. Up to the 12th day of April, all is well, writing in general terms. The trees are singularly free from blight and insect pests, and the embryo fruits are setting sure and fast. Unlike the fruit-blossoms of last year, which hung shivering so long on the brink of setting, till they had neither heart nor vitality left to do aught but fall ignominiously to the ground, Plums and Pears are now setting fast in the open, in this following close suit to the Apricots, Peaches, Nectarines, and early Plums on walls. In proof of this sure and safe setting, the petals of the fruit-flowers have begun to fall in showers in the warmer localities. Last year they hugged the trees for weeks, thus giving rise to false hopes, that never had any solid basis in fact; for after a certain rather limited time, every day the blossoms of fruit trees lighten up the landscape with their matchless beauty, there is the less and the worse chance for a crop of fruit. The persistence of the bloom is a sign of failure, not the symbol of hope to the fruit-grower. So soon as the pollen fructifies the embryo fruit with new life, the flowers begin to fade and fall; there, in fact, being proof that the second solid step, towards a plentiful fruit harvest, a sure and safe set has been taken.

Last year's fruit failure happened owing to the wet rather than through the cold. It was too slow, and whilst the first blossoms lingered, the change of perfect fructification was lost. The pollen had never been long out enough or vital enough for its functions, or if it did, there were not sunbeams in sufficient number or energy to carry it where it was needed when it was wanted; and thus miserably, and as some might say, accidentally, the fruit crop of 1892 was crippled and lost. This year the sun is in full force, and seems inclined to run full tilt against the frost, and means a rich fruit harvest. The drought so far has powerfully helped the sunshine. The two together indirectly aided, probably through the restraining

powers of the frost and north-east winds, have hardened and consolidated, and ripened and distributed the pollen. Hence, we have as it were, a contest every day in garden and orchard in which the sun and vital powers match themselves against creation, as our American cousins would say, that as against climate and all the crowded chapter of accidents that imperil our fruit crops for the next six weeks. It is early to prophesy, and probably the wish is father to the thought, but I venture with confidence to claim the victory for solar and vital force. A few weeks without blasting and unseasonable cold, and the chief danger will be surmounted. At this moment, the fruit crops are at their chief danger crisis. Even the protection of the floral envelope is being cleared off from the stigmas and embryo fruits earlier than usual. Bright sunshine, perfect and copious fructifications, have cleared or are clearing the petals off with a rush, and the tender embryo fruits are left to withstand as best they may the cutting winds and penetrating frosts. But so far they have withstood all those chilling forces, and the fruit crop is safe. A few more days or weeks and the first battalions—Plums and Pears—will be in leaf, and in less danger. Wood and leaf growth are clean, strong, plentiful. All should be left until danger from a sudden frost-nip is over and gone. Spare growth of leaflets and shootlets will probably suffice to ensure the safety of the yet more delicate fruitlets. Even the latter are hardier than usual this spring; they have not been cradled in sunshine, brought up and out in drought, and roughly rocked by north-easters for nothing. These young fruits of the year 1893 are as different as the same fruits could well be from the poor half-blanched emasculated fruitlets of 1892. Some thousands of those that did set, or seemed to set, last year, succumbed to the first general trial or strain upon them. The ruddy, robust fruitlets of this year seem better fitted to rough anything that our erratic climate may have in store for them. No doubt our fruit prospects may yet be wrecked. But then, they may not, and even a fool's paradise for a few weeks may surely be better than no paradise.

And some of our fruit prospects can hardly be wrecked. Cherries are hardly formed. Amongst Apples generally, assuredly they are not yet in much danger of wreckage. Hardly a bloom is yet opened in Cambridgeshire, notwithstanding the flood-tide of golden sunshine for six weeks, and some fruit crops are almost beyond wreckage. I went into an Apple orchard to-day with the Apple trees forming an arbour of unopened buds over a grand thicket of Gooseberries, fresh and green, with never a brown leaf nor speck of blight, and literally crowded with berries, hastening up to regulation size for first picking. Unless we get a dash of Greenland's icy weather to sandwich our sunny April showers, such crops as these, under such conditions, are already out of the wood. After all, we have no dark wood at all full of ravening wolves of cold, insect pests, fungi, &c., to pass through this year. Surely for once we may, after doing our best to command success and a full fruit-basket from garden and orchard, confidently leave the results to vital force and solar energy, which, so far as we can see, seem working together to give fruit growers a great victory over all their foes. *D. T. Fish, April* 12.

AN APOSPOROUS LASTREA.

I FURNISH a sketch, on a much enlarged scale, of a seedling Lastrea (fig. 82), which in its early stages of growth has developed a large number of prothalli upon the edges and the upper surface of its fronds, in a manner which has never hitherto been recorded. A paper was read on the subject at the British Association meeting at Edinburgh in August last, and evoked much interest, and the plant was subsequently exhibited at the meeting of the Linnean Society in November. A short abstract will therefore probably be of interest to your readers from the fronds (apospores) has hitherto been only observed upon the sites of the sori, or at the apices of the subdivisions of mature adult fronds, while in this case the prothalli developed subsequently to the sketch were mainly produced upon the upper surface, and in such dense masses as to constitute the little fronds literal bunches of prothalli, though the fronds developed normally at the outset. These prothalli appear to be quite normal in outline, and are provided with root-hairs in abundance. Whether they will produce plants remains to be seen, though their vigorous appearance fully justifies the expectation.

Curiously enough, no less than four plants thus characterised have made their appearance, three smaller ones having arisen in immediate contiguity to the first, the last and smallest presenting the extreme form of the phenomenon, the two first fronds arising from the prothallus being simply stalked prothalli of the normal cordate outline, but only distinguishable from primary fronds proper by their shape, translucency, and the presence of root-hairs behind them, the stipe is of normal length,

FIG. 82.—AN APOSPOROUS LASTREA.

and the two fronds (?), with an incipient third one, spring from an obvious axis of growth.

There are several features in this case which lead me to surmise that the plants are of apogamic origin, and not produced by the usual sexual action of antherozoids upon an archegonial embryo. Subsequently to Professor Farlow's discovery of apogamy upon Pteris cretica, it was found that Lastrea pseudo-mas cristata, the common crested male Fern, was frequently, if not constantly, produced from a sexual bud upon the prothallus, and the subsequent growth of the plants under notice establishes it precisely as in that variety. Secondly, the development of all four plants has taken place within the limits of one fair-sized prothallus, but with such a definite distance between each as could not be the case with plants originating from the same cluster of archegonia. In that case, they would be crowded close together. Finally, the intermediate condition between prothallus and Fern proper which the whole phenomenon indicates, points to the same conclusion. Hence the instability may fairly be imputed to the absence of that vital stimulus which the normal mode of reproduction involves, but which apogamy precludes.

Apart from this speculative aspect of the case, three new points are presented by it:—1st. This species (Lastrea) has not been observed hitherto to produce aposporous prothalli. 2nd. Only adult may be termed panapospory, as distinct from apical or toral apospory, the whole of the upper surface, as well as the edges and terminal points, yielding prothalli abundantly.

The plant was a chance seedling in a Wardian case in my fernery. *Chas. T. Druery, Fernholme, Forest Gate.*

PALMS AND THEIR CULTURE.

IT requires but little observation to note what a contrast is afforded in the condition of Palms under different growers. Sometimes they appear in a truly sickly condition, and at others they commend themselves by their vigorous and healthy growth. For this difference there must be reasons, and the following, perhaps, are a few of them. One of the chief causes of Palms assuming a sickly appearance, is that of keeping them too dry at the roots. This they cannot endure for any length of time without showing injury, and ultimately after suffering a loss of foliage, the growth is starved and stunted. Once in this state it will take some considerable time to restore them to health and freshness, even if ever they are really again what they should be. If I am not greatly mistaken the majority of Palms are found growing not on high ground and exposed to drought at the roots, but more frequently in low-lying districts where moisture at the roots is somewhat continuous. In such positions having plenty of moisture, combined with the alluvial soil of valleys and marshes, the Palms find a congenial home. This should give us some idea of their requirements under cultivation by which we may grow them the more successfully. Unhappily, Palms do not show visible symptoms of an insufficient supply of water by flagging as many other plants do, bearing it patiently for a time, and eventually they are suspected of being wrong at the roots and in need of a shift to restore them. This bring us to another error of cultivation, that of overpotting, which also is a grave mistake, and one which any close observer may note for himself if he ever has the opportunity of inspecting either medium-sized or large plants when they are first imported into this country from the continental nurseries. These plants are always remarkable for their health and vigour, compared with the size of the pots or tubs in which they have been grown. Now, if our continental neighbours can manage them thus so successfully, there is no reason why we should not be able to do the same if we will but adopt rational methods. Only those who have taken note of these truly noble plants whilst still confined at the roots will credit what a length of time they will retain their beauties provided they have proper attention in the way of an abundant supply of water.

Over-potting is the source of other evils in the case of plants to be used in rooms. When Palms are used in this way, and the plants happen to be over-potted, the roots must inevitably suffer through not being able to absorb the moisture in the soil so rapidly as they should do; consequently, the soil becomes colder, and the tender or young rootlets perish, not being of that hardy, wiry nature as is the case in pot-bound plants. These plants might get on fairly well as long as they are in congenial quarters; but when in lower temperatures, and exposed to cold currents of air, they cannot be expected to do so. Another result of overpotting, in the case of decorative Palms, is that of inconvenience, a sufficiently large head or mass of foliage not being available for vases of limited size, to say nothing of yet another trouble—that of additional labour in removal.

Shading during the warmer months is advisable when the plants are near to the glass, but it is not so essential when there is a good space between, so that room is afforded for the movement of a larger volume of air. The most injurious of insects are the white scale, thrips, and red-spider in some cases. Reverting to the first failing alluded to, it is necessary to state, that when Palms of medium or large size are watered, it should be done thoroughly, for the proportion of room allowed

that accorded to smaller plants. It should be seen that the plants are soaked through to the base, or the watering may be deceptive, the base of the ball being that part where most of the roots congregate, and requires even more water than the upper portion. When, therefore, there is any suspicion of a plant being dry at the bottom, it is a good plan to stand it in a pan of water for a time; in fact, when dealing with plants that are excessively pot-bound, it is safer to leave the pans under the plants during the summer months. By keeping Palms in proportionately small pots, there is far less danger of souring the soil, and thus rendering it unfit for root-action. It is, at any rate, a very rare occurrence to find a Palm injured by any excess of water, if not excessively overpotted. As an instance of what an amount of moisture a Palm will thrive in, I would quote that of a large specimen of Phœnicophorium seychellarum which I once grew until it touched the glass, and there was no other remedy left but to drop it into the tank of water below which the plant had hitherto stood. I thought that with 6 inches of the ball in the warm water it would suffer; not so, however, for it seemed to delight in it rather than otherwise. When Palms have become pot-bound, and it is unadvisable to put them into larger pots, they should be assisted with some manurial stimulant. Manure-water from a farmyard cesspool is very good as a change, or soot-water will answer very well, but I prefer a concentrated artificial manure to anything. Having tried several, I have never found anything yet to impart such a deep green tint to the foliage as Standen's Gardener's and Amateur's Friend, which, whatever it may contain, consists of ingredients that are readily assimilated by Palms, and but a small quantity is required; once or twice a week is often enough to apply it, just sufficient being used to give a light dusting over the surface. In relation to the soil used for the growth of Palms, two distinctions can be made. Some kinds, as the Seaforthias, the Phœnix, the stronger rooting Arecas, and the same of the Livistonas with the Chamærops and Pritchardias, a larger proportion of loam is advisable by reason of their extra vigour. On the other hand, the Kentias, the finer rooting Arecas, and small growing sorts in general which possess smaller and more wiry roots, will thrive well in a rather peaty soil. Good leaf-soil, such as our continental friends are able to obtain, is a good material undoubtedly. When we can secure it from Oak and Beech-leaves, it is a good substitute for peat, or may be used with it or with the loam. In any case a little loam gives stability to the soil, and the stronger growers I find to thrive better when allowed a fair proportion, say from one-half to two-thirds. Firm and careful potting are quite essential to permanency, for it does not pay to push this work through in a hurry. The white scale, before alluded to, is a tedious insect to subdue, but with patience and a trustworthy insecticide it can be done; it is most troublesome on kinds which are grown in the most heat. Red-spider attacks those with the thinnest leaves as a rule, the Chamædoreas and several of the Cocos family, for instance. Areca lutescens and Thrinax elegans are also liable to it when in dry positions. Thrips will attack the plants in the summer time, the place most susceptible being a dry airy house, such as a conservatory during that period of the year. *H.*

ON THE GROWTH OF THE VINE.

A valuable contribution to the study of the growth of the Vine has been made by Messrs. L. Roos and E. Thomas.

The authors determined, at regular intervals of two weeks, from May 15 to September 20, the proportion of dry-matter, nitrogen, potash, phosphoric acid, sugar, and acid in the year's growth (berries, leaves, and stem) of a Vine of the Aramon variety. The vineyard from which the Vine for examination was chosen was located on a clay-lime soil. It had 1886. The Vine selected had been manured with farm-yard manure in 1890.

For each analysis a sufficient quantity of material was taken from the new growth in different parts of the Vine, and the berries, leaves, and stems, were separated from each other. The results are given as follows:—

Date of Sampling.	Stage of Growth.
May 17 ...	Bunches formed, but very small.
May 31 ...	Berries more distinct.
June 14 ...	Two or three days before flowering.
June 28 ...	Flowering past.
July 12 ...	Berries the size of an ordinary Pea.
July 26 ...	Berries very rich in juice (60 per cent.).
Aug. 9 ...	Berries translucent, seeds visible.
Aug. 23 ...	Bunches beginning to ripen, berries purple.
Sept. 6 ...	As above, but colour deeper.
Sept. 20 ...	Little change in appearance.

Composition (Fresh Material) of the Vine at Different Stages of Growth.

Date.	Dry Matter.			Nitrogen.			Ash.			Potash.			Phosphoric Acid.			Sugar or Glucose.

August 23 ...	10·52	33·30	30·60	0·11	0·60	0·20	0·40	3·66	1·53	0·16	0·31	0·25	0·03	0·12	0·06	4·77	1·63	1·14
September 6...	15·15	36·80	43·86	0·11	0·56	0·22	0·47	3·68	1·73	0·22	0·29	0·39	0·04	0·12	0·07	7·27	2·01	1·60
September 20 ...	16·20	37·00	43·80	0·09	0·50	0·20	0·38	4 58	1·82	0·16	0·27	0·18	0·03	0·04	0·07	9·15	1·30	0·40

The tabulated data show that the phosphoric acid decreased from the time of flowering to maturity in the leaves and berries. It remained very constant ing (June 14), when only traces were found. It is suggested that this may be the result of an error in analysis.

The dry matter increased steadily in the leaves and stems. In the fruit it remained stationary at between 14 and 16 per cent. until the berries began to form, when it decreased to 8·82 per cent. It remained between 8 and 10 per cent. for several weeks, and then increased to 16·2 per cent. by accumulation of sugar in the berries. The acid in all three organs was less at maturity than at the beginning of growth. For the leaves and twigs the decrease was quite regular, but this was not true for the Vines.

In these the amount of acid increased steadily until it was larger than in the other organs, and then decreased as maturity advanced, until it was less than that in the leaves. At the stage when the berries began to mature there was a striking coincidence between the increase of sugar and the decrease of acid in the fruit.

During the first ten or twelve weeks the per cent. of sugar was less in the berries than in the other organs. As maturity approached, the sugar in the fruit increased rapidly, but in the leaves and stem varied only within narrow limits throughout the season.

The increase in dry substance of the Vine material, and the accumulation of plant-food constituents obtained from the soil, are shown in the diagrams. These show a constant increase from the beginning of vegetation to the time of Grape gathering.

The sums (in grains) of the potash, phosphoric acid, and nitrogen, contained by an average branch were as follows:—

June 28	...	...	1·451 grains.
July 12	...	...	1·959 ,,
July 26	...	...	2·363 ,,
Aug. 10	...	...	2·419 ,,
Sept. 6	...	...	3·158 ,,
Sept. 21	...	...	2·977 ,,

As this increase is common to all the organs, the authors conclude that it cannot be laid down as a rule, that the development of the fruit is entirely dependent upon the leaves and Vines.

At the time of harvest, calculating on the basis of 100 parts of nitrogen, there are the following proportions of fertilizing materials abstracted from the soil, in the three organs:—

	Grapes.	Leaves.	Vines.	Total.
Nitrogen	58	32	10	100
Potash	80	13	7	100
Phosphoric Acid ...	70	10	3	83

In view of the facts presented, the authors are inclined to consider nitrogen of considerable importance in a fertilizer of Grapes.

The authors sum up the conclusions applicable to this variety of Grape, and to the conditions of this experiment as follows:—

1. A saccharose is present in the leaves, stems, and Grapes, during the first three months of growth.

2. The absolute decrease of acid is not correlative with the increase of sugar in the plant or fruit.

3. A decrease of acid is observed at the same time that a notable increase of levulose takes place in the fruit.

4. The assimilation of fertilizing materials is continuous up to maturity.

5. The authors are inclined to attribute an important rôle in Grape production to the nitrogenous manures. *J. J. Willis, Harpenden.*

SPRAYING.

Prepare for the year's campaign. Begin early, and do it well. The following are the leading formulas for fungicides and insecticides:—

Bordeaux Mixture is made by dissolving 6 lb. of sulphate of copper in 5 galls. of water; slake 4 lb. of fresh lime in 6 galls. of water, and when cool, strain into the copper mixture; dilute to 22 galls. This can be used half-strength, with about equally good results, if it is applied

o every 40 galls. of mixture. Insects and fungi can nth be combated at the same time.

Ammoniacal Solution of Carbonate of Copper.—Dissolve 5 oz. of carboate of copper in 3 pints of ammonia of a strength of 22°. Stir rapidly until the copper dissolves. Dilute to 40 or 50 gallons when wanted for use. For the same purpose as Bordeaux Mixture, and easier to apply, but probably not so good a fungicide.

Eau celeste is for mildews, rots, blights, &c. Dissolve 1 lb. of sulphate of copper in 2 galls. of water; in another vessel 1 lb. of carbonate of soda, and mix the two solutions. When chemical reaction has ceased, add 1½ pint of ammonia, 22°, and dilute to 25 galls. of water.

Paris Green is the best general insecticide. For most purposes, use 1 lb. to 250 galls. of water, keeping it well stirred when using. *London Purple* can be used in the same way, but it is usually more caustic to foliage than Paris Green.

Kerosene Emulsion.—Dissolve 1 quart of soft-soap, or one-fourth pound of hard soap, preferably whale-oil, in 2 quarts of hot water, and add 1 pint of kerosene. Mix thoroughly while the mixture is still hot, until a perfect emulsion is formed—one that does not separate when cold. For use, dilute with fifteen parts of water.

Lye-wash.—One pound of concentrated lye to one barrel of water, or 1 lb. of potash to 12 galls. of water, to be used for scale-insects like the barklouse. If home-made lye is used, a bushel of good wood-ashes contains about 4 lb. of potash. *American Gardening.*

CULTURE OF TECOMAS.

Although unquestionably some of the most beautiful of indoor climbing plants, the Tecomas are not, at present, much in favour with gardeners. And the reason is not far to seek. They are, when treated as ordinary greenhouse plants, amongst the shyest flowering of that class. Those who have not seen the old species, T. capensis, at its best—as, for instance, it may be seen in the out-door gardens on the French Riviera, can scarcely form an idea of the brilliant picture produced by its bright orange-scarlet flowers from October to December. It is the difference between our climatic conditions, more especially as regards sunlight, and those which obtain in southern France, that renders this south African plant so unsatisfactory in our glasshouses. There is a method of culture, however, first adopted, so far as I know, by Messrs. Low of Enfield, which entirely overcomes its shy-flowering propensity. I can speak from experience of its value, having adopted it myself for the last five years. By this method, this species is no longer a climber, but is reduced to a pot plant for the stages of the greenhouse.

Cuttings should be taken in spring, as soon as the young growth is moderately firm, and struck singly in 2½-inch pots, in a gentle bottom-heat. After having become fairly rooted, they should be grown on in an intermediate temperature, potting them on as required. By the time they have filled a 6-inch pot with roots, they will be from 12 to 18 inches high. No stopping must be done, as it is necessary, in order to obtain flowering strength, that the plant should for the first season be restricted to a single stem. About the middle of July the plants must be taken out-of-doors, and the pots stood on, or partly plunged in, a bed of ashes, in a position exposed to the full sun. Here they should stay until a flower-spike shows at the apex of the shoot. Shortly after the young spike has appeared, lateral growths will push from the axils of the uppermost pair of leaves; these must be at once removed, so that all the strength of the plant may be centred on the flower-spike. When the young spike is about 1 inch long, the plants must be removed to the greenhouse, and kept there till the flowers are developed. Soon after rehousing the plants, a sprinkling of some patent manure, given about twice, helps to increase the size of the flowers, as well as tends to heighten their colour.

Besides T. capensis there is a new hybrid, T. Smithii ×, which is equally beautiful when in flower. It was raised in Australia from T. capensis and T. velutina, and its flowers are bright orange-yellow. It is but little known as yet, it having first flowered in England some three years ago. The treatment detailed above suits it equally as well as T. capensis.

My experience with both the species is, that when treated in this way, nineteen out of twenty flower. Being rarely more than a foot and a half high, such plants are very convenient for the greenhouse shelf, and at the season they flower, November and December, the bright orange and scarlet is especially welcome. Occasionally large plants, grown on the rafters of the greenhouse, flower, but it is only after an exceptionally hot summer—such as that of 1887 or where the lights above the plant can be entirely removed during the summer months. *W. J. B.*

HOME CORRESPONDENCE.

PEACH BUD-DROPPING.—Mr. Temple, in a recent issue, made some reference to particular varieties which are more or less subject to the above evil. I have not found much difference between them, when the fruits are ripened early and about the same time. The American varieties, such, for instance, as Waterloo, Alexander, and Hale's Early, are exceptionally early fruiting, and planted in the same house with Royal George, Grosse Mignonne, and Stirling Castle, &c., the first two usually ripen six weeks and Hale's Early three weeks before the others; and to bring forward the later ones, the houses after the early fruits are ripe, are frequently kept closer than is good for the trees—and further, sometimes the Alexander has poor flavour when ripened in May, owing to insufficient ventilation when approaching ripeness, which is somewhat difficult to prevent when later ripening fruits are growing in the same house. Bud-dropping still puzzles Peach growers, and although we are repeatedly told how to prevent it, we have not been told the cause. In the *Gardeners' Chronicle* for February 25, p. 238, "O. T. F." speaks highly of the practice of root-lifting at intervals of two or three years, according to the age of the trees; and since he adopted that method, there has not, to his knowledge, a single bud dropped. This is strong evidence, and yet I have found trees taken from the open walls and planted under glass drop a portion of their buds the second year, notwithstanding that full attention was paid to the trees. It would be interesting to many if "O. T. F." would give the names of the varieties he forces, and the time when the early fruits are ripe. I do not wish it to be understood that I have little faith in lifting the roots, believing that it is beneficial. But what was the probable cause of the malady? Had the soil of the borders got Peach-sick, and the drainage bad? If this were known, one might better form an opinion. Those who plant Peach trees usually make good preparation in the matter of borders, and the shoots and trees generally appear excellent, and one would hardly suppose it to be the fault of the roots, as it is almost impossible for them to have got out of their allotted space, and trees on the open walls whose roots are allowed to grow in some instances for years undisturbed, rarely if ever shed buds as do early-forced trees. Then, again, some trees indoors, when early forced, whose roots have not been disturbed for years, some seasons scarcely shed a bud, while the following year quite the reverse is the case, notwithstanding the treatment remains the same, and the wood is well ripened. We are also warned against too strong dressings of manure, a too high temperature at starting, over-cropping and crowding of the young shoots; yet, where all these points are carefully attended to, the evil still presents itself. We are, moreover, advised to remove the lights of forcing-houses, and I believe this to be a good practice, and to supply manure-water abundantly at various times, and never to allow the trees to lack water, besides some other precautions—but still the buds drop. If lifting the roots be a preventive, what is then the cause? I am persuaded that the mischief occurs principally in the month of October, as if the buds are cut in half, where bud-dropping is an annual occurrence, it will be found the interior of the individual buds is dead (browned, as if burned). These buds hang on the trees till starting time, when they swell somewhat and then drop. Young vigorous trees whose wood is not well ripened, do not drop their buds in this way, but the flowers open weakly and then drop, while the wood grows rankly throughout that season. Wood is made very early in the season. Of course the wood in early Peach-houses has a long spell of hot weather to pull through before the leaves fall, and it is a question whether or not the buds get burned in some way. I have frequently observed early-forced trees, whose foliage has been kept clean with the free use of the syringe, after a few nights of early frost drop their leaves rapidly. Then a few weeks' spell of very warm weather follows, the buds get forward, while the sun shining on the bare shoots may have something to do with the injury to the buds, or the buds may get a severe check in some other way. Lifting the roots very early would certainly check the trees, and prevent the buds from getting so forward as would be the case if left undisturbed. But be that as it may, I am satisfied that the evil is contracted about this time, and not at the starting period, and that it is not always attributable to dryness of the roots, over-cropping, over-crowding of the shoots, or ill-ripened wood. *H. Markham, Mereworth Castle, Maidstone.*

THE VIOLET PLUM OF EAST ANGLIA.—There need not, I think, be any doubt or mystery respecting this Plum. George Lindley's *Guide to the Orchard and Kitchen Garden*, 1831, accurately describes the Plum in question, p. 444, No. 9:—"Violette Hâtive, syn. Violet, Early Violet. Branches numerous, slender, downy. Fruit small, oval, rather pointed at the apex, and compressed towards the stalk, about 1⅜ inch long and 1 inch in diameter. Suture shallow, in some extending from the stalk to the apex. Stalk half an inch long, slender, inserted in a small cavity. Skin purple, when fully ripe of a deep blue or violet colour, and covered with a thin blue bloom. Flesh green, and adheres to the stone. Juice sugary, with an agreeable acid; ripe the beginning of August. An old Plum, cultivated by John Tradescant before 1629. It is a most excellent bearer, and ought to be planted in the garden of every poor cottager throughout the kingdom; it might then not inaptly be called the cottager's Plum." This gentleman resided at Catton, near Norwich, and would not be at all likely to mistake this popular variety (at that time) in the Norwich market. *East Norfolk.*

HARDY SPRING VEGETABLES.—The planting of autumn and winter vegetables will soon call for consideration, and it is a matter of some moment with cultivators to get intelligence regarding the behaviour of vegetables during the past winter. Among Broccolis, more than a half of the general stock was destroyed, the hardiest this season has proved to be one to which we made special reference as to its excellence last summer, viz., "Methven's June." Two rows, from plants sent for trial late in July, are in good condition; one of the rows (of a few dozen plants) was lifted with roots entire and placed beside the other row left untouched, which had several destroyed, but the plants removed are almost uninjured, sturdy, and healthy, and entire as to numbers, and expected to be ready for use in June. Veitch's Model comes next in point of hardiness, one-fourth having been destroyed; Cattel's Eclipse, a great favourite, is more injured than Model; Downie's Latest-of-All has suffered to the extent of half the crop; Veitch's Main Crop is much the same as the last-named; others, including Knight's Protecting were severely cut down. Celery stood fairly well; Veitch's Rose and Major Clarke's Red having stood the frosts remarkably well. The latest are not large, but they are now, April 25, in good condition, and likely to give useful heads till June. They had a little dry litter placed over the ridges of four rows each during the time of the severest frost, but for most of the winter they were not covered. I always plant Celery in shallow ridges—often on the level—as I have seen practised in London market gardens, and for the latest crops do not favour large growth, and I afford manure but moderately. Spinach was badly injured, but nearly every heart of the plants of the Round variety remained sound, and they are now robust plants; but the Prickly-seeded Spinach has almost disappeared. Brussels Sprouts and Borecole have done good service by supplying plenty of young Sprouts. These on ground not heavily manured stood the winter much better than those on rich land; Cabbage (six varieties), were destroyed, all but their hearts. *M. T., Stirlingshire.*

REMEDY FOR THE GOOSEBERRY SAWFLY.—It may interest your readers in general, and your correspondent, "J. D.," in particular, to know that I have

for many years kept down the Gooseberry sawfly by a vigorous and repeated application of strong clear lime-water applied either by means of a syringe, or overhead with a fine rose watering-pot, giving sufficient at a watering to wet all the foliage and the ground under the bushes. It is easily made, cheap and safe. *D. Davis, Kyre, Tenbury.*

ELLAM'S EARLY CABBAGE.—I have never seen a better stock, or a truer or finer piece of this capital early Cabbage than Mr. Sage has in the gardens of Ham House, Richmond. What a contrast does this present to many other breadths I have seen, where either the plants of diverse sorts have all bolted off to seed, or else are just leaves without hearts. Ellam's Early, as seen at Ham House, has scores—indeed, hundreds—in perfect solid-hearted condition. Nothing could be better, and a big breadth of several acres would now be worth a little fortune to a market-grower. The soil is sandy, and it dries very rapidly. Probably large sorts of Cabbages would not do at all. In the Cabbage tribe nothing could be more tender and delicious than are these small heads. *A. D.*

GENTIANA ACAULIS.—In a conversation I had with Mr. Pope, of the King's Norton Nurseries, Birmingham, he said that this plant was blooming profusely in his nursery, and he gave what he supposed was the reason for its blooming so well. From a hint given by a lady who was familiar with the Swiss Alps, and had observed that this Gentiana throve best when it could receive the thawing snow-water on to the plant, Mr. Pope, to test the value of such waterings, used iced, or the coldest water he could get, and it was dropped into the hearts of the plants during the summer, even under hot sunshine, and plants with an extraordinary number of blooms are now to be seen in his private garden. *W. D.*

SPRING BEDDING, ETC., IN HYDE PARK.—In Park Lane very noticeable are some good beds of the well-known Dielytra spectabilis, carpeted with Viola Blue Bell, and having a band of white Daisies—a happy combination; two beds of the same, carpeted with Viola Mrs. Turner, will have a very pleasing effect when the latter gets fully established; one bed of purple Stocks, having an edging of white Daisies, is pretty. A series of beds of mixed Pansies, with an edging of red Daisies, will make a grand show later on. One bed is just now particularly good. Two beds near Grosvenor Gate planted entirely with Daisies, one white, the other red, at the present time are making a good show. A bed planted with Pansies, having purple flowers flaked with white, after the style of the Countess of Kintore, is charming. The Wallflower beds, twelve in number, running through the grass plot between Grosvenor and Mount Street Gates, planted with yellow and dark alternately, are now at their best. The Auriculas, in four beds at the Mount Street Gate, have Wallflowers planted in them for the sake of the shade they afford, and these will soon be in bloom. The Flower Walk in Kensington Gardens still affords pleasure to all those who admire an old style of gardening. In the way of herbaceous plants may be seen in full bloom, noble clumps of Solomon's Seal, Polemonium rupestris, Iberis correæfolia, one of the finest of the evergreen Candytufts, with white flowers; a clump of Doronicum plantagineum excelsum, bright golden-yellow flowers on a carpet of white Tulips, is pleasing. In the way of trees and shrubs flowering in this quarter at present may be specially mentioned the Lilacs and Pyrus floribunda which are in full bloom. The Hawthorn and the Laburnum are just ready to burst into bloom, as is also the pretty Spiræa prunifolia. *J. B.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

APRIL 25.—Present: Mr. McLachlan (in the chair); Mr. Blandford, Professor Green, Rev. W. Wilks, Mr. Wilson, Dr. Bonavia, Professor Müller, and Rev. G. Henslow, Hon. Sec.

Eucalyptus Galls.—Mr. Blandford reported upon his examination of the large woody galls sent to the last meeting by Baron von Mueller from Australia (wrongly referred to Acacia). They appeared to be formed at the base of the leaves. The gall was occupied by a large solitary coccid, the head being turned away from the orifice by which the larvæ escaped. Mr. McLachlan observed that coccids usually live externally on plants; but for some time a group has been known, including several species, which form galls on Eucalyptus in Australia, the coccids being sometimes upwards of 1 inch in length.

Bardfield Oxlips changing Colour.—Rev. C. W. Dod sent a clump bearing several umbels of yellow, and one of red flowers with the following communication. Referring to the specimens brought to the last meeting by Dr. Masters, he writes: "I have during the last few years investigated many of these cases in which I used to believe, but I have come to the conclusion that if a plant growing in the same soil and position, and not having been drugged, seems to have changed the colour of its flowers, *aliquis latet error*. In the particular case of the Bardfield Oxlip, which I grow in many spare corners of my garden, I find the duration of life of the plants to be about four years. Seedlings take the place of those that die, and are often amalgamated with them, flowering all together; so that it seems that one with dull red flowers (always the first departure from the typical colour in the Primula veris, L., class) appears to be part of the same plant, which is bearing yellow flowers. By the next year the yellow-flowering plant is probably dead, and the red-flowering one has quite superseded it." On carefully washing the mould away from the "clump" sent by Mr. Dod, it was readily resolved into seven perfectly distinct plants, six bearing yellow flowers, and one being dull red-flowered, thus entirely corroborating Mr. Dod's account of the origin of a change of colour being by seed only.

Erythronium grandiflorum, giant form, &c.—Mr. Wilson exhibited a flowering spike of this plant, 16 inches in height, with leaves proportionately large. It appeared first in 1892 among some seedlings, and is considerably larger in the present year, He also showed a specimen of Narcissus triandrus, remarkable for its strong growth, bearing four instead of the usually two flowers; also an umbel of a Primula, with the flowers dissociated along the peduncle.

Myosotis Proliferous and Many-petalled. — Dr. Bonavia exhibited sprays of this variety, which is now in the market. The petals are often as many as nine or ten in number, though no flower appears to be "double." Two or three flowers are sometimes fused together, as in Tomatos. An examination of this variety made by the Secretary showed that instead of the separate flowers along a common peduncle, as in the ordinary Forget-me-not, each flower is represented by a raceme, a proliferous condition sometimes seen in Solomon's Seal, Bluebells, &c. The individual flowers were characterised by "symmetrical increase," the sepals, petals, and stamens being multiplied uniformly. The pistil was malformed, consisting of a conical structure, the stylar tube being open above, with a rudimentary stigmatic border. About eight ovules were arranged in a circle at the base of the ovary, the placentation being thus free central. The terminal flower on the main axis was very remarkable, recalling somewhat similar malformations often seen in Foxgloves, Larkspurs, &c. It consisted of a whorl of many sepals, within which were five clusters, consisting of oval scale-like carpels, with a row of glands outside them; then followed in succession within the scales a mass of petals and stamens. Five similar carpellary scales then were seen around the axis, within which all round were numerous abortive ovules. The central axis consisted of a flower turned inside outwards, the members of which being in a reversed order—viz., stamens on the outside of the tube of the corolla, the corona being thus on the exterior surface, the petal lobes over-arching them outwards, while the centre was occupied by a tuft of erect sepals. Information as to the origin of this remarkable variety, and the name of the raiser, is greatly to be desired.

Peach Leaves Malformed.—Rev. F. C. Dillon sent leaves which were curled, and with a blistered appearance, the lower epidermis peeling off. It was thought to be due to a chill by east winds, and not to the presence of fungus or insects. They were referred to Professor Green for further examination.

NATIONAL AURICULA

(Northern Section).

APRIL 25.—This exhibition was held in the Town Hall, Manchester, in conjunction with the Manchester Royal Botanical Society Show. The Auriculas formed the principal part of the exhibition, and here, as was the case in the South, the season was about three weeks earlier than usual. In consequence of the recent hot dry weather, the plants shown were not quite up to the usual standard. The premier Auricula in the show was the Rev. F. D. Horner, shown by Mr. T. Lord of Todmorden.

For six dissimilar Auriculas, the 1st prize went to Mr. Irving Hind, Halifax; and for four dissimilar kinds to Mr. T. Lord, Todmorden.

Mr. B. Simonite was 1st for a pair of Auriculas, and again for a single plant of the green edge type.

Mr. T. Lord was successful with a single plant of the grey edge type, and Mr. W. H. Midgley, in the white edge section. For a single plant of the self-coloured Auriculas, Mr. Irving Hind was 1st. For four dissimilar alpine shaded Auriculas, there was considerable competition, the 1st prize being awarded to Mr. J. Beswick, and to the same exhibitor for a single plant of this type, but with a yellow centre. Mr. J. Clements was equally successful with the white centres. Mr. S. Barlow, Castleton, was 1st for twelve dissimilar fancy Auriculas, for twelve dissimilar Polyanthuses, and for twelve Primroses.

Miscellaneous exhibits were numerous and good, and were contributed by most of the nurserymen of the district, and from the garden of the Society at Old Trafford.

YORK SPRING FLOWER SHOW.

APRIL 26 AND 27.—In connection with the exhibitions held under the auspices of the Ancient Society of York Florists, the first spring show was instituted on the above date. It is hoped that the spring show will prove an unusual attraction to lovers of flowers and admirers of horticultural produce in York and its immediate neighbourhood. The display provided in the Exhibition Building on this occasion was a good promise of success in coming years. Some fine exhibits were arranged in the two great halls, producing a beautiful effect. The centre of the largest hall was occupied with groups of plants, in or out of bloom, arranged for effect. In this department, Mr. J. Sinclair, of York, carried off the premier prize, with a tasteful and light arrangement of Ferns and flowering plants, Mr. H. Leetham being a good 2nd. The last exhibitor was 1st for six stove and greenhouse plants, one Palm, and six plants suitable for dinner-table decoration. Mr. W. B. Richardson was 1st for three Azaleas, shown as naturally grown. The same exhibitor was also awarded a 1st prize for one Azalea. Exceptionally fine specimens of Spiræa (Hoteia) japonica were shown by Miss Stewart, Mr. T. Lambert, and Mr. S. Wright, and awarded prizes in the order named.

Mr. J. Sinclair was a conspicuous winner of prizes in the classes for cut flowers and forced Strawberries. Messrs. D. Richardson, H. Leetham, J. Kirk, J. Hall, Miss Barstow, Mr. T. Lambert, and Mr. J. Sinclair carried off the principal prizes for vegetables.

BIRMINGHAM BOTANICAL AND HORTICULTURAL NARCISSUS EXHIBITION.

APRIL 26, 27.—A liberal schedule offered by the Birmingham Botanical and Horticultural Society would have brought an extensive display of these flowers to their exhibition at the Edgbaston Gardens on April 26 and 27, but the hot weather of the end of the month had driven many collections out of flower, so that the display was of a very limited character, and in the cut bloom classes Mr. Wilson, South Cave, East Yorkshire, had a walk over in the classes in which he exhibited; in his collections were leading kinds, including some of Henry Collins, very fine and distinct.

For plants in pots, Professor Hillhouse was the only exhibitor.

Messrs. Pearson, of the Chilwell Nurseries, Nottingham, had a good honorary exhibit of Narcissus, amongst them, Madame de Graaff, very fine white; Mrs. Vincent, another lovely white; Mrs. John Pope, white, quite new; Mrs. J. B. M. Camm, Glory of Leyden, a grand yellow, the trumpet golden yellow, the segments rather lighter in colour, and remarkable for breadth and solidity. A First-class Certificate was awarded to this very fine variety; N. Bicolor Grandee and N. B. Empress were also very fine in this collection, also N. incomparabilis King of the Netherlands, a superb variety; N. i. Princess Mary, creamy white, with orange stained spreading cup is also a gem; and N. i. Goliath and N. i. Frank Miles, creamy yellow, with bright yellow centre, an acquisition. N. P. R. Barr, is a beautiful yellow, of the Empress type. N. Leedsi Duchess of Brabant and Leedsi Mrs. Langtry, varie-

es of poeticus, and N. Burbidgei Model, N. B. Falstaff, and N. B. Agnes Barr, were conspicuous in this ollection.

Mr. Robert Sydenham, Birmingham, staged a ood collection of bright well-coloured flowers not or competition, including N. Nelsoni major, very harming; N. Burbidgei in very fine character; N. Mrs. . B. M. Camm, very fine; N. Barri conspicua, highly oloured; N. Johnstoni, N. Queen of Spain, very lovely, nd quite distinct; N. Leedsi Duchess of Westminster, hite, with pale cream centre, and N. Princess Mary, reamy-white, with rich yellow perianth. Mr. ydenham had also a good display of Parrot and ther Tulips.

The Birmingham Botanical Gardens set up a mall collection of Narcissi, amongst them N. Poeticus ngustifolius, Burbidgei Robin Hood, B. Mary, incomparabilis varieties, John Stephenson, Cynosure, Glow, marginata, and varieties of Leedsi, and thers.

Mr. Jannoch, Dersingham, King's Lynn, had a ery fine display of Lily of the Valley in various esigns, to which a Silver Medal was awarded; and Messrs. Hewitt & Co., The Nurseries, Solihull, set p a bank of hardy cut flowers, with a group of Narcissus blooms. *Correspondent.*

WHITE EAST LOTHIAN STOCKS IN POTS.

For some weeks past, a quantity of plants of this retty variety have been in full bloom in one of the ouses at the Moseley Botanical Gardens and College Grounds, Birmingham. Mr. French, the gardener here, has for several years past made this his avourite plant, and sows the seed at the end of April or early in May, and as soon as the plants are it, plants them out, and pots them up into 48-pots arly in the autumn, afterwards shifting them into arger pots. They are grown quite hardily until January or February, and then they are brought nto the houses, and fully 80 per cent. come with louble flowers. The plants are about 15 to 18 inches igh, with clear white flowers, invaluable for cutting. When well done, this stock is an excellent subject for early winter blooming. *W. D.*

THE BIRMINGHAM BOTANICAL GARDENS, EDGBASTON.

On the occasion of the Narcissi Exhibition, April 26 and 27, the bright summer weather tempted many to have a good look round out-of-doors, and many gems amongst our early spring-blooming plants were met with. On a narrow border running in front of the glasshouses which front the terrace many interesting plants were to be found, including a small group of Opuntia vulgaris, O. Rafinesquii, and O. senilis, which have stood several winters without protection. Close by is a strong plant of a species of Amsonia, a North American herbaceous plant, with corymbs of pale lavender-coloured flowers, and well deserving a place in any collection of herbaceous plants. The procumbent Phloxes, plants of much beauty for rockwork, bordering, and very early blooming, such as Nelsoni, divaricata, and others, are in full bloom; and against the low wall of the greenhouses there is a species of Cotoneaster, an evergreen shrub of great beauty, well fitted for covering a low wall. The leaves are round in shape, and it carries a profusion of small pink and white flowers.

On the south side of the terrace are beds for spring-blooming plants, one of which is filled with La Candeur double white Tulip, standing on a carpet of Myosotis. Another has a carpet of the True Blue Viola, and an edging of Arabis albida variegata and bright-coloured Tulips. Another bed has a carpet of the white and yellow Polyanthus, Dean's variety, with a border of the Cerastium tomentosum, in the whole of which Hyacinths were in bloom. Masses of the Early Harbinger Wallflower perfumed the garden.

In the greenhouses were observed some Orchids and other plants in flower, of which a large plant of the Sikkim Himalayan Rhododendron Dalhousieianum was in full bloom; and close by was a large specimen of Brachyglottis repanda, a greenhouse shrub which had flowered profusely, and is now clothed with a profusion of fluffy seeds. Several fine flowering plants of Cineraria cruenta, the original species, were interesting objects. A large carpet of the dwarf Veronica serpyllifolia was a striking object, a mass of small white flowers. *W. D.*

Obituary.

Mr. Edwin Sanderson.—This well known Chrysanthemum cultivator, for the space of thirty years President of the Old Stoke Newington and Borough of Hackney Chrysanthemum Society, died at his residence, St. Mary's Road, Harlesden, on the 27th ult., at a good old age, having been in ill-health for a few years past. He retired from the post of President when the Borough of Hackney Society was changed to that of the National Chrysanthemum Society. From the year 1846, almost up to the time of his death, he had been a cultivator of Chrysanthemums. Originally the secretary of the Stoke Newington Society, he passed through various offices until he was made president, and at the time *Gossip of the Garden* was published, about forty years ago, he contributed many papers on the culture of the flowers he loved so well. It was the incurved section to which he gave his attention, and he grew them with remarkable success. He was buried in Willesden Parish Churchyard on the 2nd inst., in the presence of a large number of old friends, Messrs. R. Ballantine and R. Dean, chairman of the committee and hon. secretary, representing the National Chrysanthemum Society, and a magnificent wreath from the Society was laid upon the coffin.

Enquiry.

"He that questioneth much shall learn much."—Bacon.

Would some of our readers kindly inform W. Anderson where he can obtain terra-cotta labels suitable for Orchids?

The Weather.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.

Districts.	Temperature. Above (+) or below (—) the Mean for the week ending April 29.	Temperature. Accumulated. Above 42°, for the Week.	Below 42°, for the Week. 0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; (* Channel Islands.)

THE PAST WEEK.

The following summary record of the weather for the week ending April 29, is furnished from the Meteorological Office:—

"The *weather* was again fine, dry, and warm over England and the greater part of Ireland, but in Scotland the conditions, after being fine during the earlier days of the period, became unsettled towards its close, and falls of rain and hail set in; in the extreme north some snow showers were experienced. By the end of the week, the unsettled weather was extending gradually to England and Ireland, and slight rain had occurred at nearly all stations.

"The *temperature* continued above the mean in all districts, the excess varying from 3° to 5° in the north and west, to 6° or 7° in most parts of England. The highest of the maxima were registered on the 24th or 25th, when the thermometer rose to 82° in 'England, E.,' 81° in 'England, S.W.,' 80° in 'England, S.,' and to between 72° and 78° in the other districts. Towards the end of the week, the maxima were much lower, the thermometer in many places failing to reach 60° in the warmest part of the day. The lowest of the minima occurred on the 28th over England, on the 29th in Scotland, and on irregular dates in Ireland, and ranged from 31° in 'Scotland, E.' and 'England, S.W.,' and 32° in 'England, S.' and 'Scotland, W.' to 38° in 'Ireland, S.,' and to 46° in the Midland Counties.

"The *rainfall* was less than the mean in all districts. Over England the fall was scarcely appreciable, and in Ireland the amount was only one to two-tenths of an inch, while in Scotland the fall was larger, varying between two and four-tenths.

"The *bright sunshine* was very prevalent over the entire kingdom, and greatly exceeded the mean. The percentage of the possible duration ranged from 44 to 63 in Scotland, from 50 to 57 in Ireland, and from 51 to 73 over England. In the Channel Islands the percentage was as high as 81."

Markets.

COVENT GARDEN, May 4.

Market heavily supplied; Grapes and Strawberries being a complete drug, with business slower. *James Webber, Wholesale Apple Market.*

SEEDS.

LONDON: *May* 3. — Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write, that numerous sowing orders still come to hand. Red Clover-seed in particular being much wanted and astonishingly scarce, is firmer. Alsyke, White and Trefoil are also strong. There is no change in grasses. Tares, for lack of rain, have recently been slow. Sanfoin is in short supply. Canary seed exhibits a marked recovery from its late depression. Little attention is at present given to Hemp seed. Blue Peas are decidedly better. In Rape seed the tendency is upwards. Mustard keeps firm. Linseed dull.

FRUITS AND VEGETABLES.

BOROUGH: *May* 2.—Quotations:—Spinach, 2*s.* to 2*s.* 6*d.* per bushel; Kale, 1*s.* 3*d.* to 1*s.* 9*d.*, do.; Greens, 3*s.* to 5*s.*; Parsley, 3*s.*; Carrots, 2*s.* 6*d.* to 3*s.* 6*d.* per dozen bunches; English Onions, 8*s.* to 10*s.* per cwt.; Horseradish, 2*s.* to 2*s.* 6*d.* per bundle; Apples, 4*s.* 6*d.* to 6*s.* per bushel.

SPITALFIELDS: *May* 2.—Quotations:—Apples, Tasmanian, 8*s.* to 12*s.* per box; American Apples, 10*s.* to 20*s.* per barrel; Spinach, 1*s.* 6*d.* to 2*s.*; Curly Kale, 1*s.* 6*d.* per bushel; Sprouting Broccoli, 2*s.* to 2*s.* 6*d.* per sack; Seakale, 1*s.* 3*d.* per punnet; Cauliflowers, 6*s.* to 10*s.* per tally; Greens, 4*s.* to 5*s.* long Radishes, 1*s.* 3*d.*; round do., 8*d*; Parsley, 4*s.* per dozen bunches; Endive, 1*s.* to 1*s.* 6*d.*; Cabbage Lettuces, 8*d.* to 1*s*; frame Cucumbers, 2*s.* 6*d.* to 5*s.* per dozen; Mustard and Cress, 2*s.* per dozen baskets; Horseradish, 2*s.* 6*d.* per bundle; Spring Onions, 5*s.* to 6*s.* per dozen bundles; forced Rhubarb, 1*s.* 3*d.*; natural do., 1*s.* 3*d.* to 1*s.* 6*d.* per dozen bundles; Carrots, 60*s.* per ton; Egyptian Onions, 7*s.* to 8*s.* per cwt.

FARRINGDON: *May* 4.—Quotations:—Cauliflowers, 2*s.* 6*d.* per dozen; Cabbages, 1*s.* do.; do., 5*s.* per tally; Spinach, 2*s.* to 2*s.* 6*d.* per bushel; Carrots, 60*s.* per ton; Beetroot, 50*s.* per ton; English Onions, 9*s.* to 11*s.* per cwt.; Asparagus, 2*s.* per bundle; Horseradish, 2*s.* 6*d.* per dozen; Apples, Tasmanian, 10*s.* 6*d.* per box; do., Nonpareils, 11*s.* do.

POTATOS.

BOROUGH: *May* 2.—Quotations:—English Magnums, 40*s.* to 60*s.* per ton. New, 10*s.* 6*d.* to 25*s.* per cwt.

SPITALFIELDS: *May* 2.—New Canary Island, 11*s.* to 16*s.* per cwt.; old do., 45*s.* to 90*s.* per ton.

FARRINGDON: *May* 4.—Quotations:—Bruce's, 55*s.* to 60*s.* Magnums, 50*s.* to 55*s.*; Main Crop, 80*s.* to 90*s.*; Imperators, 50*s.* to 55*s.* per ton.

LONDON AVERAGES: *May* 3.—Magnums, 40*s.* to 50*s.*; Hebrons, 58*s.* to 70*s.*; Imperators, 50*s.* to 60*s.*; Belgians, 35*s.* to 45*s.* per ton. New:—English, 2*d.* to 4*d.*; Jerseys, 1*d.* to 3*d.*; Guernsey Kidneys, 2*d.* to 3*d.* per pound.

NOTICES TO CORRESPONDENTS.

AWARD AT THE ROYAL HORTICULTURAL SOCIETY MEETING ON THE 25TH ULT.: *J. C.* The matter is of no public interest. Why not write to the secretary if you feel that justice was not done?

CARNATIONS FOR FLOWERING IN NOVEMBER: *Foreman.* Do not stop the points of shoots later than the last week in June.

CARPET BEDS, AND PLANTING THEM: *O. J.* With four beds 21 yards long and 4 feet wide in each instance, planted with the ordinary carpeting plants, your four assistants will spend half their time in trimming the plants, and otherwise keeping them in order during the summer months, so that the fifteen glass-houses that you have will perforce get but little attention. If the beds were partly filled chiefly with hardy little shrubs, say, Box, Euonymus japonicus, E. radicans in green and variegated forms, Thuia Lawsoniana erecto-viridis, small Irish Yew, Osmanthus, green and gold Hollies, Aucubas, Juniperus communis, Retinospora obtusa and its varieties albo-picta, aurea, nana, and pygmea aurea, R. plumosa argentea and aurea, and others, Widdringtonia ericoides, Cryptomeria elegans, some portion might be reserved for such hardy plants as could at this season be obtainable, and which might be planted with some chance of doing well. These dwarf hardy things are Ajuga reptans, Antennaria tomentosa, Arabis albida variegata, Artemesia frigida, Herniaria glabra, Mentha pulegium, Santolina incana, Saxifraga Aizoon, S. intacta, S. oppositifolia, Sedum brevifolium, S. rosularis, S. Ewersi, S. lividum, Sempervivum arachnoideum, S. arcuarium, and S. soboliferum. Of tender plants, there are Iresines Herbsti and Lindeni, Echeveria glauca metallica, E. retusa glauca, E. secunda glauca, Pachyphytum bracteatum, Mesembryanthemum cordifolium variegatum, a number of Alternantheras, green, crimson, orange, and other colours, Pyrethrum Golden Feather. We cannot say here how you should plant the beds, beyond advising you to group round-headed evergreens, and use pyramidal forms chiefly as dot plants, the dwarf hardy and the tender dwarf plants being employed for dividing lines, edgings, and panels. It would be best to have a plan drawn on paper, or on the beds themselves.

EXCRESCENCE ON APPLE-BARK: *H. J. C.* This is probably due to the puncture of some kind of mite. Stove-Pine next week.

GENISTA OVERRUN BY A PARASITIC PLANT: *Waterjug.* Cuscuta europæus; destroy every bit of it by fire.

INSECTS: *A. R.* Red-spider—Tetranychus telarius. Wash the Gooseberry-bushes, &c., with soft-soap, flowers-of-sulphur, and warm water; or make a sulphuret of 1 lb. of sulphur and 2 lb. of quicklime in 1 gallon of water, boil for 10 minutes. Take 2 oz. of this fluid, and 4 oz. of soft-soap, mix well together, and add 1 gallon of hot water; when moderately warm, use with the syringe. In slight attacks, thorough daily syringings and good root-watering have a beneficial effect.

LILIUM LONGIFLORUM VAR. HARRISII: *M. J.* Assuming that you buy the bulbs in August, pot them without delay in sandy loam, a little peat, and dry cow-dung, affording fair drainage, and only half filling the pots with mould. Plunge in the soil in a warm spot, say, the foot of a south wall, covering the pots with slates, and some mould over all; or put them in Cocoa-nut fibre in a garden frame. If the soil was moist when used, no water should be necessary before the bulbs push up their growth; when that is visible, put them in a greenhouse, and later, in an intermediate-house. When approaching bloom, these Lilies will stand a temperature rather higher than that of this house, but the blooms are then rather flimsy, and do not last long either on or off the plants.

NAMES OF PLANTS: *J. W. F.* Cantua dependens.—*T. B., Nottingham.* Saxifraga muscoides.—*W. E. C.* Prunus padus.—*W. H.* Kerria japonica fl.-pl.—*M. I.* 1, Magnolia conspicua; 2, Heuchera glabra; 3, Saxifraga rotundifolia; 4, Saxifraga capillaris; 5, Claytonia sibirica; 6, Saxifraga hypnoides.—*F. K.* 1, next week; 2, Sparaxis grandiflora; 3, Clematis montana.—*E. M. C.* Abortive flower of Dendrobium Wardianum.—*A. B., Birmingham.* 1, Pellionia Daveauana; 2, Pellionia pulchra.—*G. McKenzie.* Next week.—*N. F. B.* Menyanthes trifoliata, Bogbean or Buckbean.—*G. H. S.* 1, Cytisus biflorus; 2, Limonia trifoliata; 3, Hibbertia Cunninghamii, probably petals dropped; 4, Metrosideros floribunda; 5, Illicium floridanum; 6, Jasminum heterophyllum; 7, Boronia elatior.—*Delta.* 1, Cœlogyne corymbosa; 2, Bifrenaria inodora var. xanthina; 3, Maxillaria sp.—send bulb leaf, and description of growth; 4, Dolichos lignosus.—*Ripley.* 1, Found on Laurel root is Lathræa squamata; 2, Prunus Padus, Bird Cherry; 3, Berberis Darwini; 6, Blechnum polypodioides; others next week.—*R. Scott.* 1, Pteris longifolia; 2, Aspidium sp.; 3, not recognised in absence of fertile fronds; 4, Lastrea serra; 5, Asclepias Curassavica; 6, Adiantum Ghiesbreghtianum; 7, Adiantum tenerum.—*U. C. C.* 1, Lonicera; 2, Symphytum asperrimum; 3, Phlox setacea var. The others next week.

NOTICE TO LEAVE EMPLOYMENT: *Newmarket.* In your case a quarter's notice.—*Gardener.* We do not know the terms under which you took service with the lady, but a month's notice or money in lieu thereof is customary, unless there has been gross misconduct on your part.

PEACHES: *J. Hogan.* The fruits sent are mildewed, and nothing can now be done to save them. Use one of the many remedies for mildew given in these pages. Read "Spraying" in the present issue.

PEAR CATERPILLAR: *E. R.* The fly sent is not the parent of the caterpillar. For a remedy see the answer under "Small White Maggot on Flemish Cherry," in this column.

PRUNING OF MARÉCHAL NIEL ROSE AFTER FORCING: *M. J.* The plant, when the bloom for the season is on the wane, should be kept rather dryer at the root for a fortnight, and then receive a severe pruning, that is, cutting back well down to the older parts of the branches generally, but of course bearing in mind desirable extensions in any direction, the shoots for this purpose being left of considerable length; but these should be few in number in any one season. Some top-dressing of rich soil or manure will perhaps be necessary when the Rose breaks.

SMALL WHITE MAGGOT ON FLEMISH CHERRY: *W. H.* The minute grubs in your Apple blossoms are those of a small weevil known as Anthonomus pomonum. The perfect insect hybernates under the bark and in the crevices, and in early spring deposits the eggs in the young buds. Those in Cherry are, in all probability, the same, or, at any rate, are closely allied. The young grubs commence to eat the reproductive organs of the flower as soon as hatched, so that most of the mischief is done before the flowers are ready to open, and in most cases the infested buds never properly open, but become brown, as in your sample. This being the case, spraying is of little use, because the liquid cannot reach the inside of the buds, but spraying would kill the larvæ of the Tortrix, winter moth, &c. It has been found useful to place a sheet under the trees, and then, in the first warm days of early spring, to tap the trees sharply; this causes the beetles engaged in laying eggs to fall on to the sheet, where they can be collected and destroyed. Washing or scrubbing the trunks and larger branches with some insecticide during late autumn and in the winter might destroy a certain proportion of the weevils. Tarring the trunk has also been recommended. It is an insidious pest, and one very difficult to get at. Fortunately, it is ordinarily abundant only in certain years. *R. McL.*

VINES: *H. J.* Died of old age and bad treatment. They had this year sufficient life to push some weak shoots on fire-heat being applied, and that was all. Clear them out; make a border with an impermeable bottom; let it slope to a drain of rubble at the front; and, if there be an inside border, let that have a drain to itself, say, just inside the front wall of the vinery, and conduct these drains to a dry well or a garden drain. Do not have a greater depth of soil than 2 feet; make the border piecemeal, the first section being about 5 feet wide. It can be kept moist whilst of narrow width by means of a lining of strawy stable-litter, leaf-mould, &c., piled against the sides. It is not too late to make a border, and plant growing Vines. In the border use only turfy loam, lime-rubbish, charcoal, and Thomson's Vine-manure. Other aids to growth can be afforded when they are called for, and that is not at first. Use a small quantity of rich compost on planting the Vines, but no fresh or strong manure.

WORMS IN POTS: *E. W. R.* The worms do harm to plants in flower-pots by carrying the fine particles of the soil down to the bottom, which in time almost or quite prevents the egress of water. The soil then gets waterlogged and soured, and unfit to support healthy plant life. When the presence of worms is noticed, carefully turn out the ball of soil, and the worm or worms may be picked out. If the soil has been carried down to the bottom of the pot, clear away the dirty crocks, and carefully crock a new pot or wash the old one quite clean, and when it is dry crock it anew, placing a little moss or rough bits of soil on the top of the crocks, and then the old ball. If the ball is very soddened, it may be found desirable to pick off carefully the soil round the sides and bottom of the mass, and repot in new soil, affording no water for several days. Sometimes more radical measures are necessary, and the whole of the old soil has to be shaken off, the roots washed, and then carefully repotted. This should only be done with plants just emerging from their winter's rest. If the plant is a large one, and cannot well be repotted or even examined owing to its being in growth, water the soil with clear lime-water, which will have the effect of bringing the worms to the surface, when they must be caught.

COMMUNICATIONS RECEIVED. — R. Smith. — M. T. M.—J. R. J.—W. G. S.—W. G.—A. K.—F. H. E. (next week).—C. A.—M. C.—N. C. F.—G. B.—G. J.—J. O'B.—D. T. F.—M. T.—H. E.—W. S.—J. D.—B. W.—J. B. W.—C. M.—N. E. B.

GARDENING & FORESTRY EXHIBITION, EARL'S COURT, LONDON, 1893.

SCHEDULES OF PRIZES,

AND ARRANGEMENTS FOR

SPECIAL FLOWER SHOW (Opening Day), May 13. **SHOW OF ORCHIDS**, &c., May 18 & 19. **SHOW OF ROSES**, &c., June 28. **SHOW OF ROSES**, &c., July 12. **SHOW OF CARNATIONS, PICOTEES**, &c., July 26 & 27. **SHOW OF FLOWERING and FOLIAGE PLANTS**, &c., August 9 & 10. **SHOW OF GLADIOLI**, &c., August 23 & 24. **SHOW OF DAHLIAS and AUTUMN FLOWERS**, &c., September 13 & 14. **SHOW OF HARDY FRUIT**, &c., September 27, 28, & 29.

ADDRESS—Mr. H. E. MILNER, *Chairman*, GARDENING AND FORESTRY EXHIBITION, EARL'S COURT, LONDON, S.W.

REGULATIONS TO BE OBSERVED BY EXHIBITORS.

1.—The prizes offered are open for competition amongst home and foreign cultivators.
2.—Specimens not provided for in the Schedule may be exhibited, marked "Not for Competition." Extra prizes in the form of Cups, Medals, Money Prizes, &c., will be awarded for exhibits of merit. Exhibitors entering in this section are **specially requested to state definitely the amount of space required**, in order that proper arrangements may be made.
3.—Every exhibit must be legibly labelled.
4.—Every exhibitor must give at least four clear days' notice of the class or classes in which he intends to compete, on the Entry Form herewith, addressed to Mr. H. E. Milner, Chairman, Gardening and Forestry Exhibition, Earl's Court, S.W. **Under no circumstances** will entries (in the competing classes) be received on **the mornings of the Shows.**
5.—Every exhibitor must specify the amount of space (in square feet) his exhibits will occupy, in order that proper arrangements may be made.
6.—Exhibitors are SPECIALLY REQUESTED to give notice OF ANY WITHDRAWAL OF ENTRIES AT LEAST two days previous to each show.
7.—All specimens must be the *bonâ fide* property of the exhibitor or of his employer, or they will not be eligible to compete for prizes.
8.—No exhibits will be received after 10 o'Clock on the mornings of the exhibitions, and all persons (except such as may be officially retained) must retire at 10.30 a.m., at which hour the Judges will proceed to make the awards. The decisions of the Judges will be final.
9.—Cards corresponding with the entries will be furnished on the mornings of the Exhibitions at the Secretary's office.
10.—Exhibitors will be responsible for the proper placing of these cards, and they are requested to satisfy themselves that the cards correctly describe the objects exhibited.
11.—The Committee have instructions to refuse all exhibits which they consider unworthy of being shown.
12.—The Judges have the right of withholding the prizes where the specimens exhibited may be considered unworthy of them.
13.—Any prize improperly obtained will be forfeited, and the exhibitor may, at the discretion of the Committee, be excluded from competing at future exhibitions.
14.—No exhibitor can take more than one prize in any one class.
15.—Exhibitors, with their necessary assistants, will be admitted for the purpose of giving the requisite attention to their Plants between the hours of six and ten each morning.
16.—Exhibitors' Pass Tickets and Breakfast Tickets, for necessary attendants only, will be supplied by the Secretary.
17.—The Executive will not be responsible for loss of, or damage done, to plants, &c., during the Exhibitions; but all ordinary care will be taken of them.
18.—The prizes awarded will be paid within a month after each Show.
19.—In order to encourage high-class culture in Plants, Flowers, Fruits, &c., a limited number of valuable Gold Medals will be awarded to exhibits deemed so worthy by the Judges appointed to adjudicate on their merits. It is not necessary that such exhibits be displayed at the competitive shows; they may be arranged at intermediate dates, notice of intention to exhibit being given **seven days previously.**
20.—The Committee reserve the right of deciding in all cases not specially provided for by these regulations.

SPECIAL FLOWER SHOW, May 13.

Group 1.—PLANTS. *Open Classes.*

		1st Prize. £	2nd Prize. £	3rd Prize. £
Class 1.	9 Stove and Greenhouse Plants in flower, distinct	8	5	3
,, 2.	Group of 25 Roses, in any size pots—may include Standards	8	5	3
,, 3.	12 Show or Fancy Pelargoniums, in flower, in 8-inch pots	5	3	2
,, 4.	18 Greenhouse Azaleas, in any sized pots	6	4	2
,, 5.	Group of miscellaneous Flowering and Foliage Plants, arranged in a space not exceeding 150 square feet	7	5	3
,, 6.	9 Fine Foliage Plants	6	4	2
,, 7.	18 Herbaceous Calceolarias	3	2	1
,, 8.	24 Auriculas	3	2	1
,, 9.	Group of Malmaison Carnations (18 specimens)	4	3	2
,, 10.	12 Cliveias. Open	4	3	2
,, 11.	12 Amaryllis. Open	40/-	30/-	20/-

Group 2.—CUT FLOWERS. *Open Classes.*

		1st Prize.	2nd Prize.	3rd Prize.
Class 12.	3 Stands or Vases of Flowers and Foliage, suitable for the decoration of a dinner-table	40/-	30/-	20/-
,, 13.	3 Hand Bouquets	40/-	30/-	20/-
,, 14.	Basket of Cut Flowers, for table decoration	30/-	20/-	10/-
,, 15.	1 Bride's Bouquet	20/-	15/-	10/-

Meritorious Exhibits not named in the Schedule will be recognised. Exhibitors *must state definitely* amount of space required for these exhibits.

Certificates of Merit will be awarded to New Plants, Flowers, Fruits, and Vegetables of superior merit.

SHOW OF ORCHIDS, &c., May 18 and 19.

Group 1.—PLANTS.

		1st Prize. £	2nd Prize. £	3rd Prize. £
Class 1.	Group of Orchids and Foliage Plants, arranged for effect, to occupy a space 15 ft. by 10 ft. Open	10	7	5
,, 2.	Group of Orchids and Foliage Plants, arranged for effect, to occupy a space 12 ft. by 8 ft. Amateurs	7	5	3
,, 3.	Group of Crotons, arranged for effect, to occupy a space 12 ft. by 8 ft. Open	4	3	2
,, 4.	Group of Dracænas, arranged for effect, to occupy a space 12 ft. by 8 ft. Open	4	3	2
,, 5.	Group of Greenhouse Azaleas in flower, to occupy a space 12 ft. by 8 ft. Open	4	3	2
,, 6.	Group of Pelargoniums in flower, to occupy a space 12 ft. by 8 ft. Open	4	3	2
,, 7.	Group of Roses in flower, to occupy a space 12 ft. by 8 ft. Open	4	3	2
,, 8.	Group of Malmaison or other Carnations in flower, to occupy a space 12 ft. by 8 ft. Open	4	3	2

Group 2.—CUT FLOWERS. *Open Classes.*

		1st Prize. £	2nd Prize. £	3rd Prize. £
Class 9.	12 Bunches of Cut Orchids, distinct	3	2	1
,, 10.	Basket of Cut Orchids, for table decoration	30/-	20/-	10/-
,, 11.	3 Bouquets of Orchids	40/-	30/-	20/-
,, 12.	1 Bouquet of Orchids	20/-	15/-	10/-
,, 13.	12 Cut Roses, distinct	20/-	15/-	10/-

Group 3.—FRUIT. *Open Classes.*

		1st Prize. £	2nd Prize. £	3rd Prize. £
Class 14.	3 Bunches Black Grapes, any variety	40/-	30/-	20/-
,, 15.	3 Bunches White Grapes, any variety	40/-	30/-	20/-
,, 16.	3 Dishes Strawberries, distinct, 25 fruits to a dish	30/-	20/-	10/-
,, 17.	1 Dish Strawberries, 25 fruits to a dish	10/-	7/-	5/-
,, 18.	1 Dish Peaches, 6 fruits	15/-	10/-	5/-
,, 19.	1 Dish Nectarines, 6 fruits	15/-	10/-	5/-
,, 20.	1 Dish Cherries, black or white	15/-	10/-	5/-

Meritorious Exhibits not named in the Schedule will be recognised. Exhibitors *must state definitely* amount of space required for these exhibits.
Certificates of Merit will be awarded to New Plants, Flowers, Fruits, and Vegetables of superior merit.

SHOW OF ROSES, &c., June 28.

Open Classes.

		1st Prize. £	2nd Prize. £	3rd Prize. £
Class 1.	48 Roses, distinct, single trusses	4	3	2
,, 2.	24 Roses, distinct, 3 trusses of each	4	3	2
,, 3.	24 Roses, distinct, single trusses	40/-	30/-	20/-
,, *4.	24 Roses, Teas and Noisettes, distinct, single trusses	3	2	1
,, *5.	18 Roses, Teas and Noisettes, distinct, single trusses	40/-	30/-	20/-
,, 6.	18 Bunches Garden Roses, distinct, not less than 3 trusses to a bunch	3	2	1
,, 7.	12 Trusses, any dark Rose	30/-	20/-	10/-
,, 8.	12 Trusses, any light Rose	30/-	20/-	10/-

GARDENERS AND OTHERS WANTING SITUATIONS. 26 *words, including name and address,* 1*s.* 6*d.*, *and* 6*d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.*

Births, Deaths, and Marriages, 5*s. each insertion.*

NOTICE TO ADVERTISERS.—*In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.*

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSITION.—*Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.*

POSTAL ORDERS.—*To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No.* 42, *DRURY LANE, to* A. G. MARTIN, *as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.*

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST *reach the Office not later than Thursday noon.*

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements,
41, WELLINGTON STREET, STRAND, W.C.

Testimonials.

"Shirburn Castle, January 5, 1890.

"SIR.—As you requested my opinion of the houses which you erected for me some 4 years ago, I beg to inform you that I consider them a perfect success, and I have recommended them to many of my neighbours.—Yours truly (signed) MACCLESFIELD."

"Hornby Castle, Lancaster, February 1890.

"Major FOSTER has much pleasure in stating that the vineries and forcing-houses which were erected by Mr. Helliwell in 1884, continue to give perfect satisfaction, both to himself and his gardener."

"Estate Office, Ripley, Yorkshire, January 23, 1890.

"Sir HENRY INGILBY has much pleasure in stating that the glazing work executed by you, under your patented system, at the Ripley Castle Gardens, has been in every respect entirely satisfactory. The work has stood its 8 years' wear and tear extremely well, and has hitherto cost nothing to keep it in repair."

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"

ESTABLISHED 1794,

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let, would do well to advertise in the "WORCESTER HERALD," the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation, Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

GARDENER (HEAD WORKING, or good SINGLE-HANDED).—Married; experienced in all branches, including Vines, Melons, Cucumbers, Tomatos, Fruit, Flower, and Kitchen Garden. Good references from present and previous places.—W. E., Tufton Road, Rainham, Kent.

GARDENER (HEAD WORKING); age 40, married, small family; five years good character; practical experience in requirements of good establishment, Forcing Hardy Fruits, also Mushrooms, Tomatos, &c.—HORN, The Lodge, Ceader Lawn, Hampstead Heath, N.W.

GARDENER (HEAD WORKING), where two or more are kept.—Nine years in last place as Second. Thorough character. Total abstainer. Small family.—C. WEBB, Elmhurst, Woodford.

GARDENER (HEAD WORKING).—Age 27; thoroughly experienced in all branches, including Growing and Staging Roses for exhibition. Excellent characters.—HENRY WELLER, Gardener, Loudwater House, Rickmansworth, Herts.

GARDENER (HEAD WORKING).—Age 42, married, no family; twenty-five years' experience, seventeen as Head. Vines, Cucumbers, Melons, Stove and Greenhouse Plants, Fruit, Flower and Kitchen Garden, also Forcing of Flowers and Vegetables. Good reference from present employer. Wife thorough Laundress, if required.—F. PAY, Barrow Point, Pinner.

GARDENER (HEAD WORKING).—Over twenty years' experience in all branches. Wife can do Laundry, if required. Excellent character.—RICHARDSON, The Lodge, Drinkstone, Mayfield, Sussex.

GARDENER (HEAD WORKING), where two or more are kept.—Age 25, married when suited; well recommended. Good experience in Stove and Greenhouse Plants, including Orchids, Flower and Kitchen Garden.—G. T., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

GARDENER (HEAD WORKING).—Age 27, married when suited. Thoroughly experienced in all branches of Gardening. Excellent character.—GARDENER, Home Farm Cottage, Langley, Slough, Bucks.

GARDENER (HEAD WORKING), where five or six hands are kept.—Age 33, married, two children. Earl STANHOPE wishes to strongly recommend a thoroughly practical man; five years his Foreman.—Mr. SUTTON, Chevening, Sevenoaks.

GARDENER (HEAD WORKING, or good SINGLE-HANDED).—Age 30, married. Thirteen years' good reference from late employer.—H. LAWRENCE, 7, Cockburn Street, Romsey Town, Cambridge.

GARDENER (HEAD WORKING).—Age 37, married; thorough practical all-round man. Ten and a half years' good character from last place. Six previous.—H., 48, Bedford Road, Ealing Dean, W.

GARDENER (HEAD WORKING).—Age 29, married; thirteen years' experience in all branches. Five years as Head. Good characters, personal if required.—W. P., Branch Hill Lodge, Hampstead, N.W.

GARDENER (HEAD WORKING), where two or three are kept.—Thorough good all-round general experience Inside and Out. Vines, Peaches, Melons, and Cucumbers, Stove and Greenhouse Plants, Flower and Kitchen Garden. Four years' excellent character.—GARDENER, Effingham Park, Crawley Down.

GARDENER (good WORKING, SINGLE-HANDED, or thorough KITCHEN GARDEN MAN).—Married; good experience. Willing to be useful; two years' excellent character.—W. S., 154, May Street, Basingstoke.

GARDENER (HEAD WORKING); age 42, no family.—The Hon. A. TALBOT wishes to recommend his late Head Gardener to any Lady or Gentleman requiring the services of a good practical man, experienced in all branches. Wife recommended to Poultry or Lodge.—H. G., 29, Langdon Road, Upper Holloway, N.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 33, married. Thoroughly experienced; ten years present situation.—ROGERS, 50, Newington Green Road, Islington.

GARDENER (HEAD, SINGLE-HANDED, or JOBBING).—Experience in Vines, Cucumbers, Stove and Greenhouse Plants, Flower and Kitchen Gardens. Four years and a half good character.—J. E. BULL, Tackley, OXON.

GARDENER (SINGLE-HANDED, or where help is given).—Age 30; thirteen years' experience. Can be well recommended from Head Gardener of late employer.—C. ALDER, Nutley Grove, Reigate, Surrey.

GARDENER (SINGLE-HANDED, or SECOND).—Age 24; good character. Abstainer.—A. CUTCHEE, The Gardens, Shalimar, Ewell, Surrey.

GARDENER (SINGLE-HANDED, or otherwise).—Age 25. Eleven years' practical experience Inside and Out. Well recommended.—W. HUNT, High Trees, Redhill, Surrey.

GARDENER (SINGLE-HANDED, or where help is given).—Age 26, single; experienced in Greenhouse, Flower and Kitchen Garden. Good character. Now disengaged.—T. B., 131, Dennett Road, Mitcham Road, Croydon, Surrey.

GARDENER (SINGLE-HANDED, or where help is given).—Age 28, married, one child; thoroughly experienced in all branches. Six years' good character. Disengaged May 13.—W. WISCOMBE, Hollandsfield, Chichester.

GARDENER (SINGLE-HANDED, or otherwise).—Age 20; five years' good character.—C. PARSONS, Kingston-by-Sea, near Brighton, Sussex.

GARDENER (SINGLE-HANDED, or good SECOND).—Age 24; abstainer. Well experienced in all branches, Inside and Out. Good characters from present and previous employers.—L. P., 28, Finchley Park, North Finchley, N.

GARDENER (good SINGLE-HANDED); well up in all branches. Highly recommended by Mr. J. R. Bird, Head Gardener, also present employer.—H. D., 32, South Croxted Road, West Dulwich, S.E.

GARDENER (SINGLE-HANDED or SECOND).—Single; experienced in Vines, Flowers, and Kitchen Garden. Good references.—D. NEWNS, 29, Mill Street, Aylesbury.

GARDENER.—Age 28, married, no family; good all round man; practical experience Inside and Out. Good character. Abstainer.—H., 7, Beaconsfield Road, Tolworth, Surbiton.

GARDENER, where two or three are kept.—Age 33; thoroughly understands Gardening Inside and Out, including Orchids. Nine years' good character from present employer.—A. CROUCHER, Grove House, Westgate-on-Sea.

GARDENER.—Age 25; good knowledge of Propagation of all kinds, and of Culture of Stovehouse Plants. Can be well recommended. Near London preferred.—H. S., 1, Paddock Road, Bexley Heath, Kent.

GARDENER.—Situation wanted, by a young Man (age 20) in the Garden, under a good Gardener. Good character.—F. BLISSETT, Road, near Bath.

GARDENER, where two or three are kept.—Age 24; understands Grapes, Cucumbers, Greenhouse, Flower and Kitchen Garden, &c. Abstainer. Three years' good character from present situation.—H., The Gardens, Laverstock Hall, Salisbury.

GARDENER (SECOND, or otherwise).—Age 26, unmarried; experience both Inside and Out. Eight years in present situation, three years previous.—FRANK LOVE, Gorringe Road, Bemerton, Salisbury.

GARDENER (SECOND), where six or more are kept.—Age 26; ten years' experience, principally under Glass, in good Establishments. Good character and testimonials from present and previous employers.—W. HILL, The Gardens, Mousehill Manor, Godalming, Surrey.

GARDENER (SECOND).—Age 24; eight years' experience Inside and Out. Good characters from present and previous places.—S. B., West End, Brampton, Hunts.

GARDENER (SECOND), where four or five are kept; age 22; two years' character.—The Gardener at Ickworth Park, Bury St. Edmunds, can recommend a young man as above.

GARDENER (SECOND), where three or four are kept, in a private Establishment, or good SINGLE-HANDED place.—Age 22; well up in Vines, Peaches, Nectarines, Melons, Strawberries, Cucumbers, Tomatos, Chrysanthemums, Stove, Greenhouse, and Bedding Plants. Eleven years' good character, five Out and In, and six Inside. Abstainer. State wages.—Mr. G. WELLS, Mrs. Rice, Selsfield, near East Grinstead, Sussex.

GARDENER (SECOND).—Age 25; nine years' experience Inside and Out. Good character.—L. TWIFF, The Gardens, Netherwitton Hall, Morpeth, Northumberland.

ARDENER (Second), where four or more are kept.—Age 24; ten years' experience in both Plant Fruit Growing, and Conservatory Decoration. Good ences.—E. R., 20, King Street, Chelsea, S.W.

ARDENER (Second), in a large Establishment.—Age 26; thirteen years' good practical erience, six in present situation as Second. Excellent rences and character.—Mrs. LLOYD, Caythorpe Hall, tham.

ARDENER (Under); age 20.—Mrs. Curteis Norwood can recommend the above. Emed with her two years.— The Hewitts, Willesborough, ford, Kent.

ARDENER (Under).—Age 22, single; four and a half years' good character from last situation. . ROBINSON, Queen's Road, Royston, Cambs.

ARDENER (Under).—Age 21. Eight years' experience Inside and Out. Good characters. tainer.—G. MILLS, Chapel Street, Llandaff, South Wales.

ARDENER (Under).—Age 24. Used to Kitchen Garden and Pleasure Ground. Help Inside if uired. Good character from last employers.—C. C., Street bham, Cobham, Surrey.

ARDENER (Under), in a Gentleman's Establishment.—Age 20; good characters. Four years' erience.—H. COTTERILL, Greenford Road, Sudbury, dlesex.

ARDENER (Under), Inside and Out preferred.—Three years' good character.—SMITH, Finchpstead Road, Wokingham.

ARDENER (Under), or otherwise.—Age 25, married when suited. No objection to Cows. Abstainer. n be well recommended. Disengaged.—W. H. W., Bishopurne, Canterbury.

ROOM, GARDENER, or UNDER GARDENER.—Age 21; understands Cucumbers, Tomatos, elons, &c. Can have good reference; five years' experience. tal abstainer.—A. DUDLEY, Quainton, near Aylesbury, cks.

MANAGER.—Advertiser, lifetime experience in Growing in quantity for Market, Grapes, Cucumbers, ushrooms, Tomatos, choice Cut Flowers, Palms, Ferns, &c., ilding Greenhouses, &c., is open to engagement as above. rst-class references.—FRUIT GROWER, 41, Wellington reet, Strand, W.C.

MANAGER.—Life experience in Growing large quantities of Fruit and Flowers for Market, as rapes, Tomatos, Cucumbers, Strawberries, and Mushrooms. ive years in last place; excellent references.—D. N., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

FOREMAN, or SALESMAN and GROWER.—W. Wells, Earlswood Nurseries, Earlswood, Surrey, ishes to recommend his son, age 23, as above, in a Nursery. ine years' experience in all branches. State wages.

FOREMAN, Inside or General.—Age 27; eleven years' practical experience in Plant and Fruit rowing Inside and Out; two years Foreman in last situaion; excellent references.—F. DEAVES, Great Honkesley, Colchester, Essex.

FOREMAN, in a good establishment.—Age 27; twelve years' experience in all branches. Twelve months present situation. Can be well recommended.—J. CRANE, Hall Place, Bexley, Kent.

FOREMAN.—Age 24. Mr. Carr, Hawkstone Gardens, Shrewsbury, can with every confidence ecommend William Sutton as a painstaking and persevering nan.

FOREMAN, Inside.—Age 27; twelve years' experience in all branches. Good Decorator. Firstlass testimonials. Now disengaged.—GEO. WENHAM, 8, Castle Yard, Highgate, N.

FOREMAN, or FIRST JOURNEYMAN.—Age 23; has had good experience in Grapes, Peaches, Cucumbers, and in General Indoor Work. Highly recommended.—A. WEST, Glentworth Hall, Lincoln.

FOREMAN (age 25).—Charles Jennings, three and a half years Foreman to Mr. C. Blick, The Warren Garden, Hayes, Beckenham, Kent, seeks a situation as above. Good references.—37, North Road, Highgate, N.

FOREMAN, or good Second.—Age 26; ten years' experience in good places. Well up in House and Table Decorating, and general work of good place. Three and a half years Foreman in two good places.—J. G. R., The Gardens, Farnham Castle, Surrey.

NURSERY FOREMAN.—Used to Decorating, Making-up, and Table Decorations.—ADAMS, 3, Clark's Place, Bishopsgate, London, E.C.

FOREMAN.—Age 27. Twelve years' experience in all Branches. House and Table Decorations. First-class testimonials. — D., Mr. Dixon, 6, Priory Road, Kilburn, N.W.

FOREMAN, Inside.—Age 24; eleven years' experience, chiefly under Glass. Good testimonials.—E. T., Mr. Thos. Lecar, Husbands Bosworth, Rugby.

FOREMAN (Inside).—Age 27; ten years' experience in Plant and Fruit Houses, &c. Good references.—GEO. THOMPSON, Park Gatehouse, Westwell, Ashford, Kent.

TO HEAD GARDENERS.— A thorough practical FRUIT and PLANT FOREMAN offers his services. For references, &c., please apply to FRUITING, *Gardeners' Chronicle* Office, 41, Wellington St., Strand, W.C.

To Nurserymen.

PROPAGATOR.—Age 30; fifteen years' practical experience in Roses, Rhododendrons, Clematis, Conifers, Stove and Soft-wooded Stuff.—PROPAGATOR, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

To Nurserymen.

PROPAGATOR, or GROWER.—Age 26; eleven years' experience, six of which in London Market and Trade. Good references.—H. P., Low's Nurseries, Clapton, London, N.E.

ASSISTANT.—Age 20, requires situation in Seed and Florist's Shop, used to Wreath Making, &c. Good Salesman. Nearly six years last place.—BRADLEY, New Road, Peterboro'.

COWMAN.—Situation wanted by a respectable young man as above; willing to help in garden; age 21, single. Two years' highest reference.—COLEMAN, Marden Park, Caterham Valley, Surrey.

HANDY MAN, in Garden or on Estate, Painting, Glazing, Sash-lines, &c.—Age 27; good character. Country.—M. A., 5, Cheap Street, Newbury.

GLAZIER, PAINTER, REPAIRS.—Used to Old and New Greenhouses, Conservatories, and Showhouses. Job not objected to; any district.—BISNEY'S, 36, Cornwall Street, Moore Park Road, Fulham, S.W.

COLLECTOR of RENTS in the Country.—Age 33 years; fourteen years' character. Highest references; security if necessary.—X. O., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

HOLLOWAY'S PILLS.—In general debility, mental depression, and nervous irritability there is no medicine which operates so like a charm as these famous Pills. They purify the blood, soothe and strengthen the nerves and system, give tone to the stomach, elevate the spirits, and, in fact, make the patient sensible of a total and most delightful revolution in his whole system. They may be commenced most unreservedly as the very best family medicine in existence. Though so powerfully efficacious, they are singularly mild in their operation, and might be given with perfect confidence to delicate women and young children. They contain not a grain of mercury, or any other noxious substance, and cannot do harm. Delicate females and all persons of sedentary habits will find these Pills a blessing.

Send for ILLUSTRATED LIST of

JOHN BLAKE'S

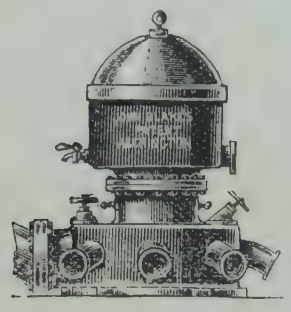
PATENT SELF-ACTING HYDRAULIC RAMS,

For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms, &c.

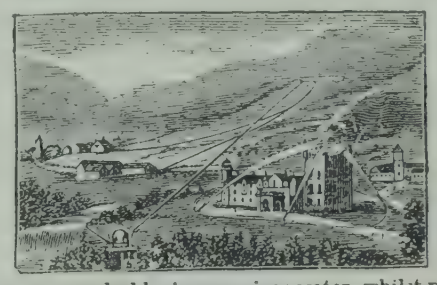
No Cost for Motive Power, which is obtained from the Stream of Water passing through the Ram.

NO OILING OR PACKING REQUIRED.

MADE IN SIZES TO RAISE FROM 300 TO 200,000 GALLONS PER DAY. WILL FORCE TO A HEIGHT OF 1500 FEET.



This ram works with no metal in motion.



This view represents a ram worked by impure river water, whilst pumping pure water from a well or spring and forcing it to a small reservoir on the hill, at an elevation of 295 feet, and a distance of 1 mile, from which reservoir the water is gravitated for fire extinguishing and general requirements of mansion, stables, farm, and village.

TESTIMONIALS.

From CHARLES HART, Esq., A.M.I.C.E., 3, Avenue Road, Leamington, March 13, 1893.

Brixworth Union Rural Sanitary Authority, East Haddon Water Supply.

DEAR SIR,—Since the opening of these works, in May, 1891, the two Double-acting "B" Rams supplied and fixed by you have done their work with a minimum of attention, uninterruptedly and satisfactorily. Pure spring water obtained from a gathering ground on the side of a hill is carried along iron pipes a distance of 548 yards, down to a cistern fixed in the ram-house. From this cistern it flows to the rams, which are driven by impure water—drawn from an adjacent brook, with an available fall of 12 feet—and thence by them forced along an ascending delivery pipe, a distance of 1520 yards, to an iron reservoir, at an elevation of 204 feet. From this reservoir mains are laid which supply the hall with its stabling, the rectory, six farm houses, two dairies, and twenty-four wall fountains for the villagers' use.

The average daily consumption exceeds 4000 gallons, which one ram easily delivers, thus exceeding your guaranteed quantity by more than 1000 gallons per ram per 24 hours. Generally the two rams are regulated to divide the work between them, but occasionally it devolves upon one only.

If more widely known, this means of supplying villages and small towns with a limited quantity of spring water, forced to a suitable elevation by means of your rams, driven by impure water, would most certainly be more generally adopted.—Yours faithfully,

CHARLES HART.

From the Right Honourable the EARL of HARROWBY, 44, Grosvenor Square, London, February 21, 1893.

SIR,—I have pleasure in stating that the two Hydraulic Rams, which you supplied and fixed for me last autumn, at Sandon, have proved so far most successful, and that the work gives every promise of durability, while the economy, compared with the former much smaller and intermittent supply by steam pump, will be considerable.

With a fall of about 14 feet from a previously existing mill pool, the rams supply reservoirs 168 feet above the brook whence the water is forced, through pipes of 1½ mile in length.

They sent up, as long as I required it, about 41,000 gallons per day.

I now generally work the two rams alternately (for a fortnight or so each), but can at any time work the two together, if the full supply of 41,000 gallons should be needed.

The business of this somewhat complicated water-supply was conducted by you with singular promptness and punctuality; and no local difficulties arose in the execution of the work, owing to the excellent and efficient men whom you sent from your works at Accrington.

I am, Sir, your very obedient servant, HARROWBY.

From Mr. J. A. RUTHERFORD, Agent to C. F. H. Bolckow, Esq., Estate Office, Marton Hall, Middlesbrough, September 26, 1883.

DEAR SIR,—I am glad to say that the Rams you put down on the Hambledon Estate, for Mr. C. F. H. Bolckow, are working very well. You undertook with 16 gallons per minute, to send up 1500 gallons a day, and with enough water to work the Rams at full power, 2000 gallons a day. With a supply of 11¾ gallons per minute they are lifting 2200 gallons, and when working full power, 3105 gallons per day are sent up to a height of nearly 400 feet. They made a clear start, and have gone well since. The delivery pipe in the above case is 9000 feet in length.

From THOMAS ROBERTS, Esq, Estate Surveyor to His Grace the Duke of Sutherland, K.G., Surveyor's Office, Trentham Hall, Staffordshire, April 13, 1886.

DEAR SIR,—I am pleased to say that the Hydraulic Ram you supplied and fixed at Tittensor (the residence of the Marquess of Stafford, M.P.), does its work very satisfactorily, with a fall of 9 feet 6 inches, raising 9000 gallons daily to a height of 150 feet. The Duke of Sutherland, K.G., inspected the working of the Ram, and expressed his entire satisfaction with it.

I am, yours faithfully, THOMAS ROBERTS.

From Sir S. M. MARYON WILSON, Bart., London, November 17, 1891.

SIR,—I have much pleasure in stating that the two "A" Rams you supplied and fixed for me at Searles, on my Sussex estate, have proved a great success, especially when the small supply of driving water is considered, as with a supply of 7 gallons per minute only, they have daily thrown 3000 gallons to a height of 96 feet, and through a service of pipes over a mile in length; and testing them recently (with plenty of driving power) found they lifted 7000 gallons per day.

The economy effected by their use is considerable, as they have entirely superseded a steam pump. S. M. MARYON WILSON.

From HENRY MORTON, Esq., Agent to the Most Honourable the Marquess of Ripon, K.G., Ripon, April 12, 1886.

DEAR SIR,—The Patent Ram, with 1½ mile of service pipe, a large galvanised tank, and other fittings, which you fixed for the Marquess of Ripon, for the conveyance of water from Hutton Moor Springs to Blows Hall and Copt Hewick Hall, are highly satisfactory to all concerned, both as an engineering success and the intrinsic merits of the materials supplied. About 6000 gallons of water per day are forced into the tank at Blows Hall, nearly a mile distant, and 127 feet above the Ram, the overflow falling into a 20,000 gallon underground tank, from which it gravitates through the 4-inch main 800 yards long, with a fall of 70 feet, to the service-cocks and fire-plugs at Copt Hewick Hall, where, in case of fire, two or three powerful jets of water can be thrown on to the roof of the Hall.

I consider your method of carrying out the work is everything that could be desired, and, whilst the waste-power water from the Ram is less than you specified, the quantity elevated is just what you guaranteed. I am, dear Sir, yours very truly, HENRY MORTON.

From T. H. SIDEBOTTOM, Esq., Etherow House, Hadfield, February 22, 1882.

Induced by the good report of my cousin, Mr. J. A. Sidebottom, as to the working of the Hydraulic Ram he had from you, I ordered the one you fixed here a year ago, which I am pleased to say has since worked well night and day. Yet the two Rams you fixed at Snow's Hill Manor, Gloucestershire, for my brothers and myself, are, I think, a still more remarkable example of your success. We had a Ram fixed by a well-known firm, which proved a miserable failure, and which your Rams displaced. They are forcing the water through three-quarters of a mile of delivery-pipe, a little in excess of the quantity you guaranteed, to an elevation of 340 feet, and without the slightest hitch to the time of the last report from our tenant.

From Mr. HENRY ROBINSON, Engineer to the Stockport District Waterworks Company, September 8, 1883.

DEAR SIR,—I can now report well of the two Hydraulic Rams we have fixed to your instructions for the supply of Disley village; 40,000 gallons per day was the quantity you promised they would force to a height of 68 feet, but, on testing them, I am convinced that 50,000 gallons is not the limit of their power, whilst the quantity of waste water used in driving them is not equal to half the capacity of the 6-*inch pipe by which they are fed, and I am inclined to the belief that a more simple and efficient pump cannot be found.*

B. S. WILLIAMS & SON,
VICTORIA AND PARADISE NURSERIES,
UPPER HOLLOWAY, LONDON, N.

TO NURSERYMEN AND OTHERS.
TUBEROUS BEGONIAS.
Finest quality, in every known colour, Double and Single, for pots or bedding, carefully selected in separate colours.
Doubles, 3s. to 10s. per dozen.
Singles, 15s. to 30s. per 100.
E. EDWARDS, Holmeside, Leighton Buzzard.

NEW COLEUS, "DISTINCTION."
INTRODUCED 1892.
To the Trade, 9s. per dozen, in Small Pots.
This is undoubtedly the finest introduction in the way of Coleus yet announced, and will prove a most valuable acquisition for Bedding or Decorative Purposes, the foliage being of a striking reddish rich maroon, and darker in colour than any other variety; it is also of a very sturdy growth, and hardy character.
Award of Merit from the Royal Horticultural Society, August 23, 1892.
J. A. MORRIS, Nurseryman, Church Road, Acton, W.

BOUVARDIAS.—Strong young Stuff, with balls of roots, will almost fill 60's, in 12 best-named sorts, including the grand new White Paniculata jasminoides, Flavescens, fl.-pl., Neuner, Garfield, Cleveland, &c., 2s. 6d. per dozen, 12s. 6d. per 100.
NEW WINTER-FLOWERING CARNATIONS, REDUCED PRICES, to clear, good stuff, ready for potting; La Neige, most profitable white for winter bloom, 4s. per dozen, 12s. 6d. per 100; Miss Joliffe Improved, by far the best pink Carnation for winter-flowering, 20s. per 100, 4s 6d. per dozen.
BORDER CARNATION GERMANIA, best yellow, 5s. per dozen, 35s. per 100 out of 60's.
LEMON VERBENAS, 2s. 6d. per dozen, 10s. per 100.
COLEUS, splendid coloured vars., 1s 6d. per dozen.
FUCHSIAS, choice, including the grand new Duchess of Edinburgh, 1s. 6d. per dozen.
TUBEROUS BEGONIAS, unsurpassed strains, large flowers, mixed colours, 2s. 6d. per dozen, 15s. per 100, fit for 60's.
BOUVARDIA PURITY, the best white for cutting, large and free, 3s. per dozen, 15s per 100. For cash only.
CRANE AND CLARKE, Hillside Nursery, March, Cambs.

FOR SALE, Cheap, a few Hundred of Six Kinds of ALTERNANTHERAS; also a few Dozen of ECHEVERIA PEACOCKII, E. METALLICA, and PACHYPHYLLUM.—E. CLEMENTS, London Road, Coventry.

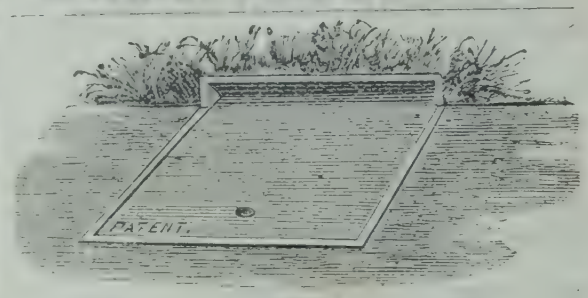
2 DUKE ST LONDON BRIDGE



FIXED.
THE IMPROVED GARDEN-GULLY
(VINCE'S PATENT).
This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—
6-in., 1s. 6d.; 8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d. 15-in., 8s.
(*The larger sizes are very strong for carriage drives.*)

The best of all variegated Dracænas—bright, decorative, free-growing. It was the sensational new plant at the great International Show in Ghent last month. Unanimous First Prizes and First-class Certificates wherever shown. First-class Certificate at the International Exhibition, Earl's Court. First-class Certificate, Royal Horticultural Society, this week. It formed one of our six new plants with which we won the First Prize at the Earl's Court International Exhibition last year, and also at the great International Exhibition in Ghent this year.

Price on Application.

ALOCASIA WATSONIANA.

A handsome new species. One of the six new plants with which we won the First Prize at Ghent.

Price on Application.

RANUNCULUS CORTUSÆFOLIUS.

The giant Buttercup. A splendid foliage and flowering plant for the conservatory. Has been awarded First-class Certificate.

STROBILANTHES DYERIANUS.

Brilliant-foliaged bedding and greenhouse plant, bluish-metallic coloured leaves. It received a First-class Certificate. It formed one of the six plants which received the First Prize at Ghent.

THE

Gardeners' Chronicle.

SATURDAY, MAY 13, 1893.

ENGLISH STYLE OF LANDSCAPE GARDENING.

SINCE the beginning of the eighteenth century the art of landscape gardening has made such strides, that not only is it now recognised as a profession having exponents other than architects, but also a distinct form of landscape gardening has been reached, called, and rightly so, too, "the English, or gardenesque style."

Up to the eighteenth century, this art was generally, if not entirely, practised by architects, and was characterised by formal art features, by the introduction of duplication of lines, by intricacy of design, and by treating the ground as a plane surface, and was called the geometrical, or formal style. The distinctive features of this style, besides what I have mentioned above, are, straight walks, or walks branching off at right angles; beds formed in circles, segments of circles, ovals, oblongs, angulars, or parallelograms, flights of steps, balustraded walls, terraced banks, raised platforms, sunken panels, exotic forms of vegetation, symmetry and gaiety of tone; while the forms of Nature, which are used in this style are those which are the most artificial in their appearance. This artificiality in laying-out gardens, which sometimes resulted in a feeling that Nature had been dragged into the effect, was due, no doubt, to, firstly, the influence of the exponents of architecture; and secondly, to the love of the wealthy, in courting the admiration of the spectator by the costliness, design, and labour bestowed on the garden, and showing in every possible way the presence of art, in contradistinction to the natural scenery around.

Then there came a revolution in landscape gardening, about the period that "genre" painting in art, and the modern novel in literature became fashionable, and out of it arose a style called the "natural or picturesque," the chief feature of which was to copy Nature in the garden as closely as possible, and to sacrifice utility and convenience to glorious wildness, which recognised no kind of symmetry or order, but dealt with broken ground, curious and bold forms of vegetation, rushing water, sham ruins stained as it were by time and age, and which possessed an indescribable wild grace, very pleasing to the eye.

After the beginning of the nineteenth century, however, newer influences began to be felt, the freedom of continental travel, peace at home, and the accumulation of private as well as public wealth, resulted in a broader conception of the art of landscape gardening, called, as above said, the gardenesque or English style.

Before proceeding further, I would ask my readers this question, viz., What was the agent by means of which Nature formed her hills, her valleys, &c.? The answer is, "Water." [ED. Frost?]

Water, by its constant yet gentle action, or by its sweeping violent force, has been, without

question, as a great landscape gardener writes, a principal agent in forming the natural surface of our earth. Therefore, it is right in forming a restricted landscape to bear in mind Nature's grand agent in the formation of her greater landscapes, wherein are presented endless varieties of form, of line, and of colour, far-stretching level plains rich with herbage, hill-sides and tops covered with foliage, as well as swelling downs with their great sweeping curves.

The English or gardenesque style then has, as one of its most characteristic features, curved or serpentine lines; smoothness and freedom from angles are among its numerous indications, while the beauty and variety of its lines is its object. This style, however, does not entirely forbid the use of straight lines, but they must be in connection with the house or some subordinate building, such as a greenhouse or conservatory.

It is a style that blends and interfuses art with Nature, which prunes nature of its roughness by means of art, drawing from each their most appropriate and agreeable elements, the grace of nature without its roughness, the refinement of art without its stiffness.

Turning to the general principles of this style, one almost wonders whether it is possible to tabulate any given rules for one's guidance, for it is a recognised fact, that a student in this art with a truly artistic spirit feels more than he can describe.

There are, however, certain principles which should always be borne in mind, viz:—

Simplicity with some degree of intricacy is perhaps the first point to be aimed at in laying out a garden. A design can be essentially simple without being crude and bold, intricate without being mazy. Simplicity is an element of pure beauty, and of the highest taste. A garden should be more or less simple in its arrangements, according to its size and position, the lines all graceful, the decorations elegant. Intricacy brings into play a something beyond, a something more to explore, a newness of scenery brought about by the clever grouping of plants, whether in masses or specimens, thus giving a charming variety of aspect, that entices one on to higher beauties, from "Nature on to Nature's God."

Convenience, again, is another principle which should be carefully studied and thought over. However tastefully a garden may be laid out, it loses all its charms, if comfort and convenience have not been provided for. Compact composition of its various parts, seclusion, and agreeable transition from one part of the garden to another, without any decided break to disturb the harmony of the design, are further principles which should always be borne in mind in carrying out successfully this English style of landscape gardening. There is, however, one principle which must be remembered by designers of a garden, and that is adaptation, for without adaptation no rules, no principles that can be given, will be of any real value. Every plot of land, whether it be half an acre or whether it be a hundred acres, has its own peculiar characteristics, which should influence the disposal of its various parts, and give colour and variety to the whole design. It is, in fact, the delicate adaptation of the various rules, styles, and principles of treatment to the peculiarities and existing objects of each place, that brings credit to the landscape gardener and satisfaction to the owner.

It is all but impossible to do anything more than merely touch upon the chief principles of this all-interesting style in a short paper like this, but I hope in future papers not only to write more fully about these principles, but also with the help of diagrams to treat of planting, water, and other highly-important materials connected with landscape gardening in general, and especially with the English or gardenesque style. *Arthur M. Kettlewell, Southsea.*

New or Noteworthy Plants.

SCILLA (LEDEBOURIA) BUCHANANI, *Baker, n. sp.**

This new species of Scilla has just flowered at Kew. The bulbs were obtained in Nyassa-land by Mr. John Buchanan, C.M.G., who has sent home very large collections of dried plants from that region, which have been widely distributed. The Scillas of this section are very numerous, both in tropical Africa and at the Cape.

Bulb globose, 1 inch in diameter. Produced leaves three, lanceolate, bright green, unspotted, erect, the largest 1 foot long, under 1 inch broad. Scape green, flexuose, 6 to 8 inches long. Raceme dense, oblong, about 2 inches long; pedicels spreading, ½ inch long, the upper pale mauve, the lower cernuous. Perianth oblong, green, ⅛ inch long, the segments reflexing from below the middle. Stamens rather shorter than the perianth; filaments dark purple; anthers small, globose, yellow. Ovary shortly pedicellate, globose, truncate and dilated at the base; style dark mauve-purple. *J. G. Baker.*

FRITILLARIA (AMBLIRION) ZAGRICA, *Stapf* in *Verhand Zool. Bot. Ges. Wein*, 1888, p. 351.†

This is a new species of Amblirion, which has been imported by Leichtlin from the Rashand Mountains in western Persia, where it was gathered by Dr. Polak, in a collection that was worked out by Dr. Stapf. It is nearly allied to F. tulipifolia and F. armena, both of which have been figured in the *Botanical Magazine.*

Bulb small, globose; leaves about 8, alternate, glaucous, the lower oblong, 2 inches long, the upper growing gradually narrower, the central lanceolate, the uppermost linear; stem one to three headed, a span long; perianth oblong, ⅝ inch long, dark lurid untesselated purple, glaucous outside; segments ⅛ inch broad, the inner with a small green oblong nectary at the base; stamens ⅓ inch long; filaments pubescent; anthers small, dark purple; style entire, as long as the ovary. *J. G. Baker.*

RICHARDIA LUTWYCHEI, *N. E. Br., n. sp.*

This is the fine and distinct Richardia that has been in cultivation during the past few months under the name of "Pride of the Congo," and is now flowering with Mr. S. G. Lutwyche, of Oakfield, Eden Park, Beckenham, after whom I have the pleasure of naming it. It is stated to have been imported from the region of Lake Nyanza in tropical Africa, and is one of the much-admired yellow-spathed kinds, allied to R. Elliottiana and R. Pentlandii, but is abundantly and easily distinguished from them and every other known species, except R. melanoleuca, by its setose petioles; other well-marked differences may be found in the mottled coloration of the petioles, and in all the adult leaves having the basal lobes overlapping one another in the sinus. The following is a description of the plant:—

The petioles are 12 to 16 inches long, terete, pale green, densely marked with longitudinal lines, and, on the basal part, with indistinct, irregular, transverse bars of a darker green, the basal half beset with numerous stiff hairs or bristles; the blade is 8½ to 13½ inches long, 4 to 7½ inches broad, triangular-sagittate acute, the basal lobes broadly ovate, very obtuse, overlapping one another in the sinus, the midrib with about six or seven primary veins on each side; the colour is bright green on both sides without spots; the scape is about 1 foot long, terete, light green, with darker green lines like the petioles, but not mottled; spathe 3½ inches long, convolute, forming a deep cup obliquely truncate at the top, shortly and abruptly subulate-pointed, bright yellow, slightly tinted with green outside, and having a large purple-black blotch at the base inside; the spadix is about half as long as the spathe, the male and female parts about equal in length; ovaries dense, angular-globose, with a short conical style, light green; anthers of a rich deep yellow, emitting pale yellow pollen. Native of tropical Africa.

Of all the genera of Aroideæ, Richardia is, beyond a doubt, the one that has the greatest popularity, even the various richly-coloured and highly-esteemed species of Anthurium are not such general candidates for public favour as the familiar Arum Lily (R. æthiopica) is, the pleasing shape and purity of its flowers, and the ease with which the plant can be cultivated, causing it to be a favourite with every one. Richardia æthiopica was introduced into cultivation by the Dutch in 1687, and remained in sole possession of the field for one hundred and seventy-two years, since it was not until 1859 that another species became known to horticulturists, in which year R. albo-maculata and R. hastata were simultaneously introduced into cultivation. Now, however, there are no less than eight species in our gardens, namely, R. æthiopica, R. hastata, R. albo-maculata, R. melanoleuca, R. Rehmanni, R. Elliottiana, R. Pentlandii, and the present novelty. Judging from the eagerness with which the yellow-spathed species have been sought after, in all probability the three last-named species will become plants of great popularity, and in the immediate future are likely to figure largely at our horticultural shows. But besides the above, there are others yet to come. On the western side of Africa there is a species, in Angola, awaiting introduction, which I think is distinct, and appears to have yellow spathes; whilst on the south-eastern side there is R. macrocarpa yet to come, and, in all probability, there remain some others to be discovered in that vast and little-explored area extending from the Equator southwards to the latitude of the Orange River. I know of a yellow-spathed species, which may, however, be the same as R. Elliottiana, and one that has the margins of the spathe more or less tinted with rose, this I have reason to believe is just being introduced into cultivation, but I have not seen an actual specimen of it, unless it should prove to be R. Rehmanni, which was sent to the Cambridge Botanic Gardens some years ago as a rosy variety of R. æthiopica, although under the English climate no rosy colour was developed, at least in the only specimen I have seen. Looking at the improvement that has been achieved in the development of the spathes of Anthurium Scherzerianum, there would seem to be equal possibilities for the future of these plants in the hands of horticulturists, especially when hybridisation has been made to play its part; and we may perhaps at no distant time see plants with bright yellow spathes as large and showy as those of a fine R. æthiopica, for at the present time the spathes of these yellow-flowered species appear to me too convolute and too cup-shaped to be entirely satisfactory, but possibly by crossing them with R. æthiopica something very desirable from a florist's point of view may be obtained. *N. E. Brown.*

* *Scilla (Ledebouria) Buchanani*, Baker, n. sp.—Bulbo parvo globoso; foliis productis tribus lanceolatis erectis pedalibus immaculatis; scapo flexuoso foliis duplo breviori; racemo denso oblongo pedicellis elongatis; bracteis deltoideis minutis; perianthio parvo oblongo viridulo; filamentis styloque saturate purpureis; ovario breviter pedicellato basi truncato dilatato.

† *Fritillaria (Amblirion) zagrica*, Stapf. in *Verhand Zool. Bot. Ges. Wein.*, 1888, p. 351.—Bulbo parvo; caule brevi 1—3 cephalo; foliis 7—8 alternis glaucescentibus, infimis oblongis superioribus angustioribus; perianthio parvo oblongo atropurpureo haud tesselato, segmentis interioribus basi foveolatis; staminibus flore brevioribus; stylo integro.

A TRAVELLER'S NOTES.

(*Continued from p.* 387.)

Yokohama, April 22, 1892.—Whilst at Tokio, I was able to visit some private gardens, two of which belonged to the Emperor. They were both pretty, though not large. The first-named contains a large

pond, over which stretches a wooden bridge, shaded by flat-trained Wistarias. The Oaks, Pines, Maples, Podocarpus, Sciadopitys, and Camellias formed by far the greater part of the vegetation.

Tokio.—One of the prettiest gardens I saw at Tokio belonged to a friend of Mr. Tashida, a young lawyer. The whole of the centre was occupied by a pond surrounded by uneven sloping banks, on which were trained Pines, clipt red Maples (just sprouting), Retinosporas, whilst on the highest points were stone lanterns. The whole arrangement was very effective. These lanterns (see fig. 85, p. 575)—corresponding to the mandarin's umbrella of China, and still in use there—were a sign of nobility, and were also borne in front of Daimios in former times. Each bears the crest of its owner, and it was customary for wealthy men to present stone images of their family lanterns to temples and shrines. The temples in Shiba have many hundred such, standing in rows, about 7 feet high.

A horticultural exhibition in Uyeno Park was rather interesting. Amongst the most noteworthy objects was the cultivation of the Acorus gramineus. In low flat trays, from 6 to 24 inches long, are small stones covered with water to represent a lake and rocks; in this is a big piece of stone, often red or white, though more usually of a greyish tinge. On this big piece are one or two clumps of Acorus, of the brightest Pea-green, living and growing thick and straight in the barest film of soil. The stone chosen is often of varied and curious shape, heightening the effect.

Another curiosity, which promises to be pretty later on, is Davallia bullata (see fig. 84, p. 571). The roots of this Fern are bound together by wire into all sorts of shapes—balls, anchors, ships, birds, &c. These shapes are strong solid masses of living root and moss, tightly and firmly held by wire. I am told, when in leaf, nothing is seen but the image in Davallia foliage. Pyrus spectabilis is very pretty, and much cultivated in porcelain pots; it flowers with the greatest freedom, as does Pyrus japonica and its fine varieties, though I do not fancy the Japanese have any finer than we have.

European flowers, Petunias, Mimulus, Hyacinths, Primulas, Polyanthus, Pansies, Geraniums, Cinerarias, &c., are comparatively new, and much admired. The first two named are extremely well cultivated, and produce enormous flowers, but the remainder of those named are not over bright. Hyacinths, single bulbs, fetch a good price—wretched varieties, imperfectly grown, 1*s.* to 1*s.* 6*d.* Rhapis and Cycas are both largely and well grown—the way the former is done could well teach us a lesson. It is kept closer, many more shoots are obtained, the foliage is reduced in size and rendered more graceful, and all in a smaller pot than with us—which is possibly the cause. Clipped Retinosporas and miniature Pines are, of course, in great force, and cheap. One Pine I saw, about 18 inches high, was startlingly like a real tree growing wild. It was thought a good deal of, and placed apart from others—it was one of the most successful bits of training I had seen. Of course, chance has a good deal to do with these things. Magnolia Soulangeana nigra is very fine; I recently saw two rows flowering profusely. Some of the Camellias in nurseries are also good, particularly a large red and white one—the ground beneath the trees was almost hidden by the large number of flowers fallen. The single red form grows wild, often forming largish trees, though I do not remember to have noticed any above 30 to 35 feet.

Aska-Tama is the name of a public garden on the outskirts of the city. It is situated on the top of a hill, from which a fine view of the country beyond is obtained. The landscape chiefly consists of a few large factories, with regular tall smoking chimneys; fields of Rice, now fallow, and many large patches of Rape, now flowering well in solid yellow patches. The Rice is annually sown, but the old stumps are left in after the harvest—a thing I have not seen before, probably because in the tropics another crop is put down as soon as one is off.

Tokio is a huge place, the distances are great, and the means of locomotion slow, and by no means cheap. For long distances one must have two men to a rickshaw, costing nearly 5*s.* per day. As a rule, however, one can manage with one man, though if the day be hot and the journey long, the pace is very slow.

Round the imperial palace, legations, the hotel, and one or two of the principal streets, it is fairly easy to find one's way, but once in the side streets one soon gets lost—they all look exactly the same, and there is in reality very little difference between them. One curious thing is how all eastern nations, amongst themselves, are like each other. I have to meet a Jap at least twice or three times before I should know him again amongst others; with Chinamen it is still worse, and the same in India.

White men, on the other hand, equally resemble each other to Easterns—they rarely recognise a European until they have seen him several times. The other day a Jap told me I was in his place only on the day before—a startling assertion, as I had never been near the place. All Englishmen find the same thing, unless they have resided some time in a country, and got to notice more trifling details about persons than casual visitors are able to do. One cause of the difficulty is that all young Chinese and most young Japs are clean-shaven, only elderly men wearing, especially in China, even a moustache.

In this district I saw no Abies. Sciadopitys and Retinosporas, nearly always obtusa, and perhaps aurea, pisifera, and filifera are to be seen; in one place were some fine rows of the latter genus, well filled with plants 10 to 12 feet high. I may here mention R. pisifera is here wild, sometimes reaching 35 feet, its stem is straight and looks strong. Cryptomeria japonica is also cultivated, and much used for hedges, when it forms a thick strong mass; old plants in the parks and temples, &c., are very fine, often 120 feet, and higher. Cryptomeria elegans, so common under cultivation in hedges, &c., at Yokohama, I have not noticed represented by a single specimen at or round Tokio. Small Rhapis are much grown in jars for decoration, though other Palms are seen occasionally; this is the only one I have noticed in general cultivation or in quantity. Amongst some of the prettiest variegated plants are a very finely silver variegated Illicium religiosum, and a yellow varie-

*

Fig. 83.—Alocasia watsoniana.

(See New Plants from Hort. Sander, *Gardeners' Chronicle*, April 15, 1893, p. 442.)

gated Ilex latifolia. A double pink Plum, the colour of Paul's Thorn, is now extremely pretty, if not so useful for forcing as Cerasus Watereri, it would yet make a fine grafted standard. Corylopsis spicata is very fine in flower. I recently saw a large round bush, some 10 feet high, covered with its pendulous yellow flowers; it does well round Tokio. An elongated form of Citrus japonica looks to me good, though it does not make the neat little plants the small Oranges we now sell do. The fruit is long, of this shape, ○; I think distinct, but the foliage is the foliage of the ordinary Orange. Pæonies, both planted out and in pots, are coming on fast, having now attained a height of from 6 to 9 inches. Stauntonia hexaphylla is common, and grows freely; it is often trained along fences, which it sometimes does not fail to hide. Camellias in the nurseries, clipped plants, are good, the ordinary red one is mostly seen. In one place I saw several rows of neatly-clipped pyramidal plants, some 10 to 12 feet high, covered with flower.

The price of Rhodea japonica, selected varieties, is surprising. Young Mr. Tashida told me good varieties fetched 500 yen—a yen being equal to 3*s*. (£1 = 6½ yen, is a fair estimate). I was much interested, and with an introductory aid, called on Mr. Shino, a well-known grower of only this plant. The place did not look like a nursery, and was quite enclosed from public view. On entering, I was received by a very superior-looking Jap, who lived in a house far above the ordinary state, and who was evidently well-to-do. Immediately behind the house was a long case of wood, the sides being of wire. In this were three rows, one above the other, of small Rhodea japonica, in the neatest and prettiest little porcelain pots. The plants were small, some green, and some curiously variegated. The soil was in very small lumps, not bigger than the smallest beads, and had been lightly and carefully pressed down round the plant, looking very neat; the whole, pot, soil, and plant, looked like a toy. One very pretty variegated form had the tips of the leaves for about 2 inches of the purest ivory-white—not a suspicion of green in it; there were four leaves about 9 inches long—price 50 yen = £7 10*s*. Another had an irregular bar of the purest white across the leaf; but this was of no great value. A fine yellow variegated form was also for sale at only 3 yen. On my asking to see the best variety, I was shown a plant streaked with white. The plant had eight leaves, and one small off-shoot; it was a dwarfed form, some 5 inches high and 12 inches wide—price 2000 yen. Of course, this may have been a prohibitive price for an exceptional variety. I heard afterwards that the prices were fair. Another handsome variety, but not dwarfed, was variegated with white, and had four stiff, upright leaves, 15 inches high—price 100 yen = £15 at the present rate. Some of the dwarfed forms had very broad foliage, quite oval, such as I had not seen in England. I tried to stop and watch a man potting, but he promptly stopped, and I was marched off to tea—doubtless, very polite, but there was considerable method in the politeness. I, however, noticed the plants were watered by immersion—doubtless, so as not to disturb the neat appearance of the soil. It is curious that a plant on which we set so little store is so highly prized here. There were many score of plants besides those in the case mentioned, all in neat rows in the same blue-and-white porcelain pots, all spotlessly clean and neat.

Curiously-trained Pines, a small pond, paths formed of stone slabs, a few inches above the soil, that one might always walk cleanly; small undulating grass banks; two sheds of Rhodea, the costly case referred to in front of the open-matted floor of a large room; the whole certainly within half an acre—all far away from the town, in absolute stillness and tranquillity, was very delightful the evening I was there, but brought forcibly to my mind what I had recently read about—the monotonous, uneventful life of the average Jap.

On my way back, I passed a high bank covered with Bamboo—the same species I had seen in a garden at Yokohama, but different to anything I had seen elsewhere. It makes apparently but one long, strong, straight shoot, no offshoots, as in other Bamboos here and in the tropics. It is very handsome, but looks peculiar.

The Cherries are magnificent. Tinted photographs, which I will forward at the termination of my visit, will give you a most complete idea of their beauty; one looks up, and walks under a ceiling of the softest pink. At Mukojima, a row along the river bank, a mile long, in some places faced by a row on the opposite side of the road, is a sight it will be difficult to forget.

Most temples, and they are legion, have a row, and so have many private houses. Cherries are to be seen everywhere in and around Tokio. It would be difficult to find anything more beautiful for the few days they are in flower.

Thiba and Uyeno Park have several avenues and open spaces planted with these Cherries, now thronged with many thousand people daily to see them. Thiba is chiefly famous for its temples built by the Tynwoga Shoyums, full of wonderful lacquer and carving-work. The Pines and Cryptomeria japonicas are very fine in this park, especially immediately in front of the temples. In front of one is a much finer, though possibly not so old, Weeping Sciadopitys, than in Uyeno.

Kerria japonica is a very fine thing here, quite different to what I have seen it in Europe. It is by no means uncommon, many gardens having one or several good bushes, the ends of the long shoots bearing many flowers each, of a rich golden-yellow. It is here freer-flowering and more showy than I have seen it in England.

April 25.—Three days later. Things have much changed since I was last at Yokohama. The grounds of the Gardeners' Association are now pretty with young Maples and other plants. Wistarias, both the blue and the white, are just commencing to flower freely in pots, though those outside will require some weeks more. Daphne Genkwa, Amelanchier canadensis, and Enkianthus japonicus, are now very good, the two latter forming nice bushes covered with flower. Pæonies will now soon open; those in pots in about seven days, those outside in about three weeks. I have seen a few out; they were not striking. *James H. Veitch.*

(To be continued.)

CHEMICAL CONSTITUENTS OF THE CARNATION.

At least one carefully-made analysis of the Carnation has been given already, including separate analyses of the root, stem, leaves and flower. It was made by Rudolph Andreasch in the laboratory of R. Maly, at Graz. The flowers were taken from two and three year stocks of a full, red-flowered variety of the Carnation (D. Caryophyllus); the roots and stem were taken about the middle of March, just when the leaves were budding out; and the leaves and flowers at the beginning of June; of the flowers only the petals were taken. The roots were one-tenth to three-tenths inch in diameter, and the stems 5 to 6 inches high. Of the flowers, 10,000 were required, giving 180 grammes of air-dry matter. Unfortunately, the data given do not enable us to compute the ash contents of the whole plant, the analyses having been made with a different end in view. However, they may be of interest, so give the figures (per cent.).

	Root.	Stem.	Leaves.	Flower.
Pure ash	5·64	5·26	4·44	5·59
Potash	23·33	23·00	35·51	49·41
Soda	0·85	...	...	...
Lime	45·26	45·16	27·69	5·85
Magnesia	4·43	5·48	8·27	3·68
Oxide of iron ...	3·83	7·95	6·42	7·19
Oxide of manganese	...	...	Good traces.	
Alumina	2·56	Traces.	...	...
Phosphoric acid ...	11·22	10·25	10·91	14·84
Sulphuric acid ...	2·59	6·46	4·59	4·04
Silica...	5·34	0·61	3·71	4·25
Sodium chloride ...	0·59	0·44	0 71	2 35
Potassium chloride .	...	0·65	2·16	8·39
	100·00	100·00	100·00	100·00

So that the flower has much more potash, iron, phosphoric acid, sulphuric acid and alkaline chloride than the rest of the plant, and very much less lime.

However, this knowledge is not enough to tell us what fertilizer we should apply.

In the first place, the soil will supply a portion of these needed foods, and the amount supplied will depend upon the nature of the soil, and its treatment.

In the second place, there is no doubt that under identical conditions of soil and climate, two different plant species will exhibit different powers of taking up from the mineral and other soil constituents what they need.

In the third place, a difference in the excess of food supplied, and especially in that of the several ingredients supplied, often exerts great influence on the development of special organs, both as to the rate, earliness and extent of their development.

You will at once perceive that while the average composition of a plant may enable us to judge of its exhausting tendencies, and what plant elements must, in the end, be most rapidly removed, it will not serve to inform us exactly what is needed for the present growth of the crop, outside of the supply that is already provided by the soil.

To determine this for given soils will require exact experiments, and experiments having in view the peculiar needs of the plant, and the special developments required. *Wm. Frear, in The American Florist.*

VIOLAS AND VIOLA CULTURE.

The wonderful popularity of the flower has been the direct result of the labours of such workers as W. Dean, John Baxter, Mr. Jas. Grieve, Dr. Stuart, M. G. McLeod, Mr. W. Cuthbertson, and also in a great measure on account of the unanimous advocacy of the horticultural press.

The Viola has many qualities to commend it to the great flower-loving public. It is of easy growth; it is moderate in price; it is effective in lines, masses, or clumps; it is charming in a cut state; and it appeals to all classes. The Viola is used in tens of thousands to adorn the great public gardens and parks of our country. It is equally suited, and very largely used, to beautify the villa and cottage homes in the suburbs of all our large towns. For such purposes as we have just mentioned, the most suitable varieties are the self-coloured ones, like Archie Grant, Bullion, Countess of Hopetoun, Ardwell Gem, Lord Elcho, Holyrood, Duchess of Sutherland, Wm. Neil, and to them may be added Bluecloud, Countess of Kintore, and The Mearns. These are varieties which will grow anywhere, and almost under any conditions, provided they are planted out early in the season. Of course, the number could be very largely extended, but we select these meantime, as illustrating our argument. It has always appeared to us, and doubtless to many others, that the more chaste and fancy varieties have not the same remarkable strength of constitution as is characteristic of the selfs. This can, no doubt, be accounted for by their being removed further from their original progenitors, and by many of them having been too much crossed with V. tricolor and its descendants—the show and fancy Pansies.

Culture.—On the Alps in Central Europe, as well as in our British fields and hedgerows, Violas of many species grow and flourish—true "wildlings of Nature;" and many of our modern garden varieties retain a robustness of constitution and a regardlessness of extremes which they must have acquired and inherited from progenitors who were wanderers by flood and field. This will almost serve to show that their culture is an easy matter. In any good ordinary garden soil which has been enriched with manure, Violas will grow, and grow well. They are not particular as to situation or exposure, provided they are planted out early, and get thoroughly established before the warm weather sets in. Autumn planting is very much practised in England, and with very good results. Even in Scotland, it is a capital plan if a proper regard be had to the selection of varieties for the purpose. The grower who is anxious to have perfect individual blooms for the purposes of exhibition or table decoration will naturally take more pains than he whose sole object is to have telling and effective masses or borders, and he will also work with many different varieties requiring more careful culture. Such varieties should not be planted out in autumn, but should be wintered in a cold frame, and carefully planted out in prepared beds in March. A site for such beds should be selected in the autumn—one, if possible, which is sheltered, and slightly shaded from the noon-day sun. The ground should be deeply dug in autumn, and in January or February it should be dug over again, and a liberal quantity

of well-decomposed manure incorporated with the soil, and also a quantity of soot—say, a spadeful spread over every 10 square yards. Just before planting, the surface should be broken up with a rake, and made firm and fine, a good dry day being chosen for the work. After planting, unless slugs or green-fly attack the plants, they will not want much attention. They will be improved by having a top-dressing of old manure or leaf-soil, which has been passed through an inch sieve, worked in among the plants by the hand. The beginning of June is a good time to do this. From the beginning of May, they will be in continuous bloom for months. All Violas are easily propagated by cuttings, and nearly all varieties seed freely.

Exhibiting.—For this purpose, large, clean, perfect blooms are requisite, and such can only be obtained if the plants are in good health and have not been allowed to exhaust themselves by over-blooming. Should wet weather precede the day of the show, the plants will require to be covered to keep the flowers from getting soiled. This can be done, as it is only a temporary expedient, by placing sashes or even bits of board over the plants on which the best flowers are, and, strange though it may seem, the dark self varieties are the first to be injured by excessive damp, and should, therefore, be the first protected, although heavy rains spoil light-coloured flowers by splashing dirt upon them. The art of making sprays for exhibition can only be learned by experience. The number of blooms required — usually six or nine—should be selected, all of one variety, of course, and each individual flower should have a fine wire carried alongside the stalk, the upper end being pushed into the spur or calyx of the flower, and the wire itself bound gently to the stalk by means of a piece of knitting cotton soaked in water. This much being done, no great difficulty will be experienced in making the blooms into a spray and working in some small pieces of foliage. The best way to learn the process is to get a well-made spray from an exhibitor after a show, and when at home, take it carefully to pieces; or, what is better still, get a practical lesson from one who is an experienced hand. Endeavour always to have every spray neatly named, and all arranged on a nice stand. This goes a long way oftentimes to secure the prizes. Another hint which should prove of some value to beginners is—do not have too many sprays of dark-coloured varieties in one stand.

Selections of Varieties.—We can only go into this in a comparatively limited way here:—

The best bedding varieties.—Whites: Countess of Hopetoun, large pure white flowers, free blooming and of good habit; Crofthouse, a remarkably hardy and free-flowering variety, pure white medium-sized flowers. Lady Dundonald, clear white, delicately pencilled with light purple, remarkably free blooming—the earliest white. Yellows: Ardwell Gem, sulphur-yellow, dwarf habit, profuse bloomer. Bullion, bright golden-yellow, one of the best for any purpose; very early. Grievei, pale yellow, a remarkably good bedder; hardy everywhere. Lord Elcho, deep orange-yellow, with beautiful glossy-green foliage. Dark Blues: Archbald Grant, rich indigo blue, large flowers on long stalks; indispensable for bedding or exhibition. Holyrood, dark blue, free-blooming, compact habit. Max Kolb, bright ultramarine blue, pleasing and distinct, also early and free. Mrs. C.

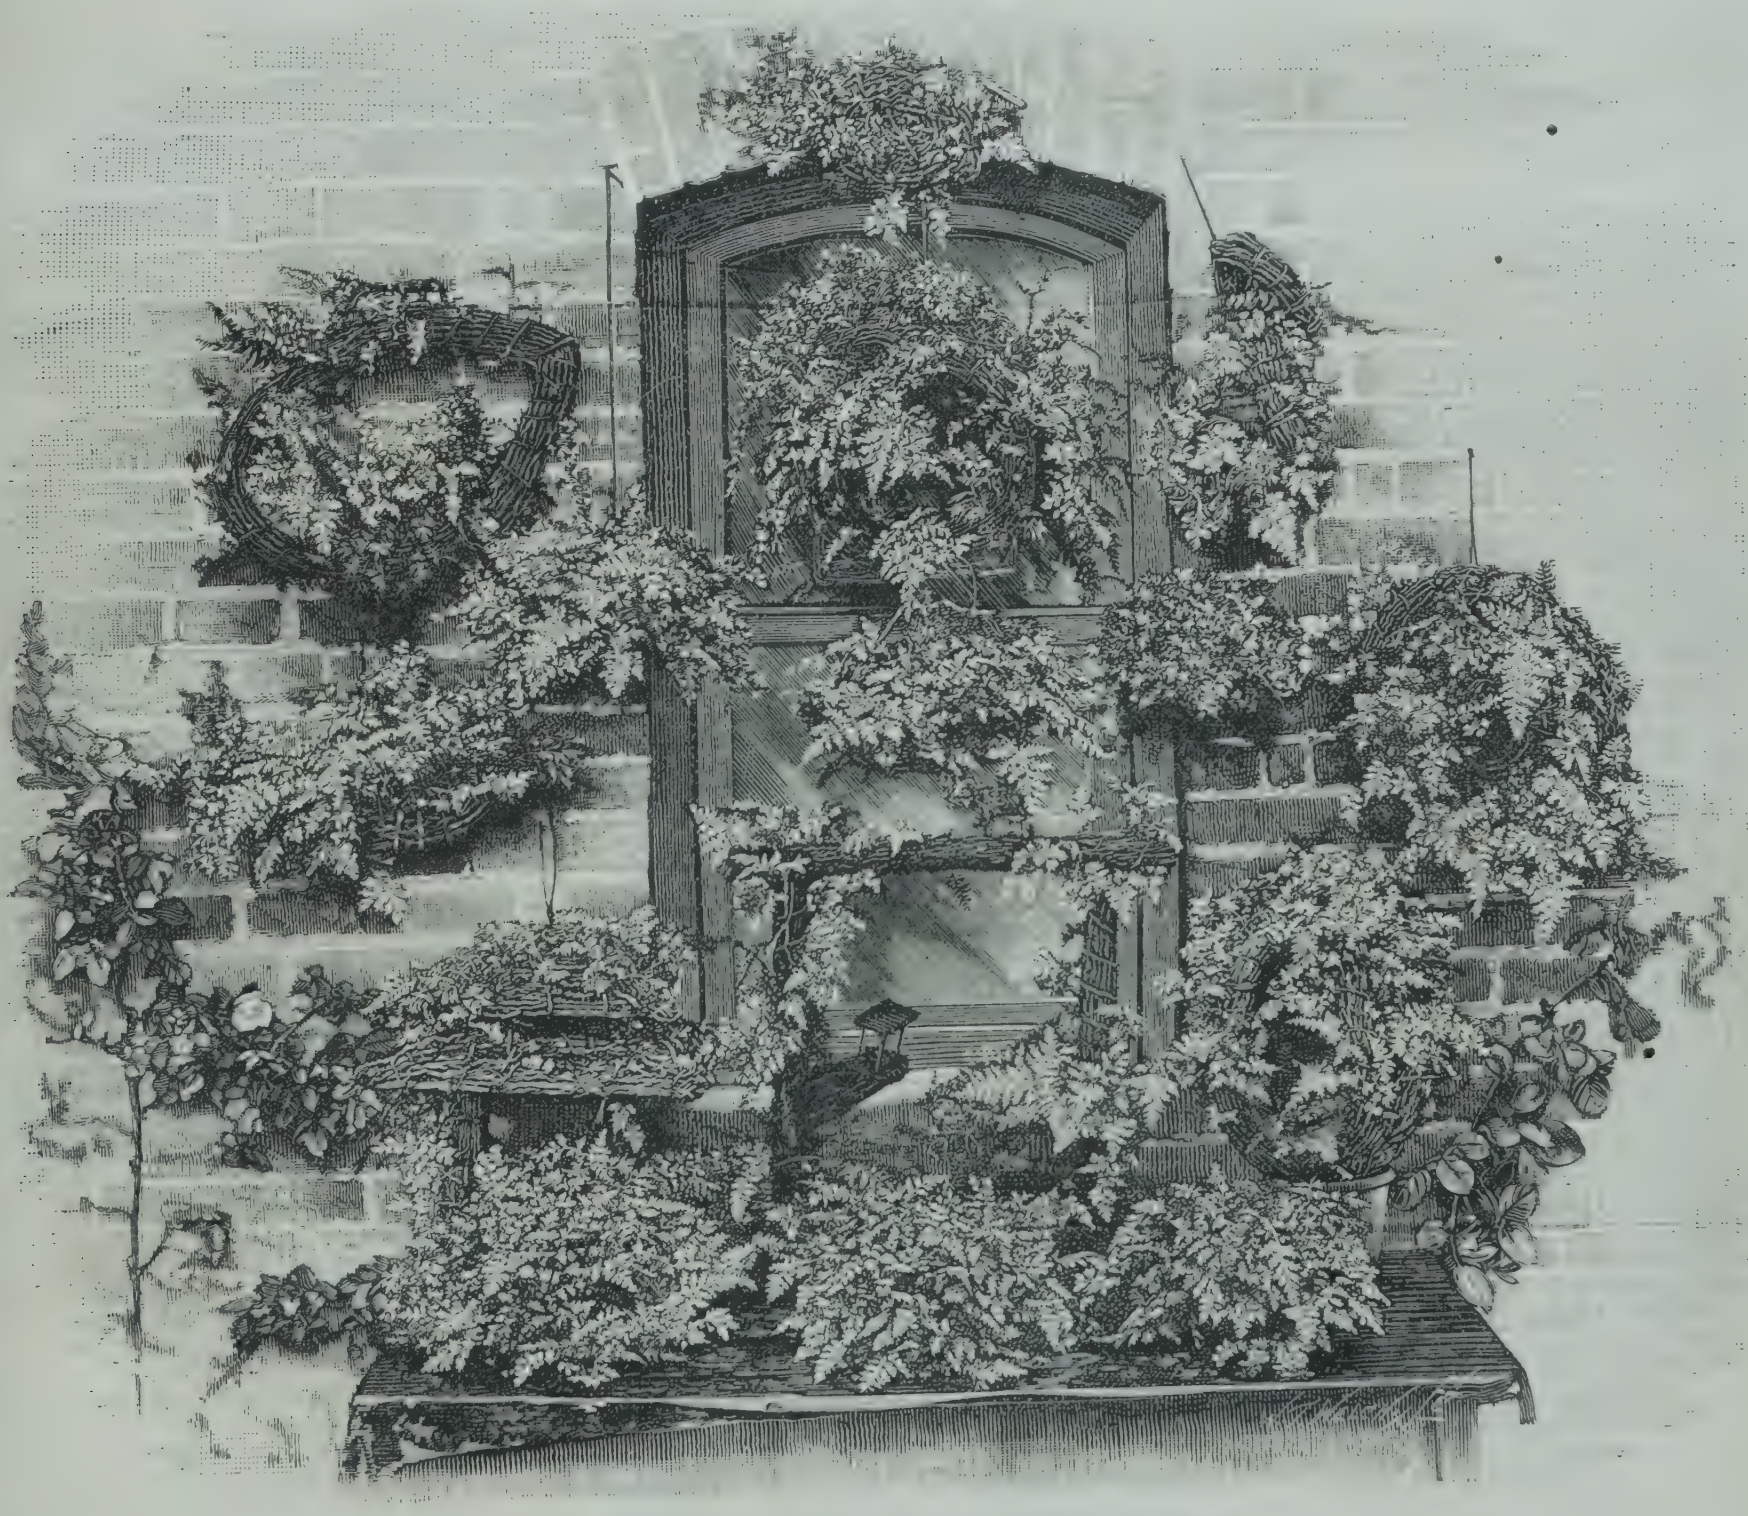

FIG. 84.—DAVALLIA MARIESII, IN GROTESQUE FORMS.

(Previously figured in *Gardeners' Chronicle*. See p. 568.)

Turner, purple self, a most effective bedder. True Blue (Deans), unsurpassed for bedding, the plants being usually smothered with blooms. Light Blues: Duchess of Sutherland, bluish-mauve self, free and useful for bedding or cutting. Favourite (1893), a new variety, a light blue bedder. William Neil might more correctly be described as pale rose than pale blue; a very free, beautiful, and distinct variety.

Varieties of Recent Introduction.—Edina (Dobbie), a dark Countess of Kintore, finely-formed flowers, very free; effective in all sorts of weather. Favourite (Dobbie), a light-blue bedder, of first-rate habit; very early—a decided acquisition. Laverock (J. D. Stuart), a vastly improved Blue Cloud; pure white ground, laced with blue all round. Lemon Queen (Dobbie), a very large lemon-coloured self, with a good habit; extra fine. Mrs. Hay (Hay), ground colour lavender, striped with rich purplish-crimson. Peter Barr (Barr), the most distinct Viola ever introduced; yellow, with broad margins of pale violet. Rob Roy (Dobbie), a large yellow flower, with chocolate-coloured blotches on the upper petals. White Duchess (Baxter), white, distinctly edged with blue; after the style of the Duchess of Fife, but an improvement even on that fine variety. White Flag (Baxter), large pure white flowers, produced on very long stiff stalks; fine for cut flowers. Sylvia (Dr. Stuart). Described by the raiser as the finest cream-coloured bedder out. This we can cordially corroborate; every one will want it after it has been shown. Violetta (Dr. Stuart). This charming miniature Viola gives its name to the new section, and is the best that has yet appeared. It is very hardy and almost truly perennial. The foliage grows into great tufts of glossy dark green, and the blossoms, which are white, are raised above it on short, stiff footstalks; it is truly a joy to behold when in good bloom. The perfume is very sweet, resembling V. odorata. *Dobbie & Co.*

SELECT DECORATIVE PLANTS.

(*Continued from p.* 477.)

COCOS FLEXUOSA.—Where tall plants are required, and the space does not admit of the use of more-spreading Palms, this is a most useful subject. Perhaps it can hardly be recommended as a single specimen, but it is most effective in groups, and deserves to be more extensively grown than it is. In the culture of all Palms it is very essential that the roots should be kept in a healthy state; the drainage should be good, and the plants potted firmly in the best kind of fibrous loam, to which plenty of sand and a small quantity of rotted stable manure are added. The manure should be well dried, and freed from worms, &c., as should all the rest of the soil used. If the loam be of a heavy kind, some peat or leaf-mould may be used with it, but I like it best without peat, it being a substance which gets soured from the frequent syringing that is necessary. I have alluded to the desirability of keeping Palms in pots of moderate size, and this cannot be too strongly insisted on. Plenty of atmospheric moisture will assist growth, and it goes a good way towards keeping the plants free from insects.

It is now the custom to use many of the stove Palms in the summer beds, and although they will stand such treatment for a considerable time without any apparent harm, mischief will be seen later, when, after a little bad or wet weather, they are taken indoors, the new leaf will come up weak and sickly, and frequently be much disfigured. *O.*

CULTURAL NOTES.

HYBRID AQUILEGIAS.

FROM a packet of seeds of the above I have raised plants of several shades of colour, some of which are really very pleasing. There are few flowers which when sparingly arranged in vases have a better effect than Aquilegias. If the purpose is to have plants that will flower next year, the seed should be sown during the present month in pans, or in the open on a sheltered border. I prefer pans, pricking the seedlings off when large enough to be well handled, and transplanting them on to well-prepared beds, as by this method one may make sure of a good strong lot of plants. Aquilegias are hardy, and look well in beds or in patches in the borders of herbaceous plants. *H. Markham.* [They are excellent for brightening up Rose beds, and incommode the Roses but little. ED.]

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By BAILEY WADDS, *Gardener, Birdsall Gardens, York.*

CLETHRA ARBOREA (Lily of the Valley tree).—This interesting evergreen produces racemes of pure white sweet flowers, somewhat resembling those of Lily of the Valley. They are useful for cutting purposes, and the trees grow well in pots or tubs in a compost of peat, loam and sand. It is a strong grower, and requires plenty of air and water during the summer, and it is easily increased by seeds or cuttings. It requires to be well pruned-in at times after flowering, and it flowers best on short well-ripened shoots.

PITTOSPORUM TOBIRA.—This bright foliaged sweet-flowering Evergreen is worth growing for cutting purposes. It produces clusters of white flowers resembling Orange blossom, and is very easy to cultivate in pots, or planted out against a wall or pillar. A mixture of loam and leaf-mould is all that it requires, and cuttings strike freely in heat.

THE FERNERY.—The plants will need careful attention in the matter of watering, syringing, and ventilating, and the bright weather of the past month having caused rapid growth, much water will be necessary by those plants which are growing in pots, as well as in a somewhat lesser degree by those planted out. Care should be taken that the drainage is efficient, and that specimen plants in large pots do not get too much water. If possible, use only soft water, and that at the same temperature as that of the house. It is well to have a basin in some part of the house for the cultivation of aquatic plants, and for immersing baskets and pots when dry. This basin is useful for softening unsuitable water by exposure; moreover, the vapour arising from it has a beneficial effect on the Ferns. The floors should be sprinkled twice daily, but heavy syringing of the Ferns should be avoided. Afford air to the inmates in the early morning if the weather be fine, and shut them up in the afternoon with a slight damping overhead. All ferneries facing either north or south will require to be well shaded, span-roofed houses needing a heavier kind of shading than others. If the collection of Ferns is large, two houses should be devoted to them, one for the tropical or stove species, which succeed best in a temperature of from 45° to 65° during the winter, and from 55° to 75° during the summer; the other for the temperate or greenhouse varieties, with a temperature of from 45° to 55° in winter, and 55° to 75° in the summer.

LYCOPODIUMS and SELAGINELLAS that are growing vigorously should be afforded a good supply of water at the root, which will demand good drainage of the pots, &c. They do well with the same treatment as Ferns. Avoid crowding specimen plants, and afford the panfuls of plants plenty of room to show off their natural beauty. A sharp look-out must be kept for woodlice, cockroaches, and slugs, which devour the young fronds of Ferns and mosses, especially the Birds-nest Ferns, which, if injured at starting, remain unsightly. Place pieces of Carrot about the fernery, and visit them at night with a light, destroying all that can be caught by this means. Phosphorus-paste is likewise an excellent means of ridding the house of cockroaches. Aphis can be kept under with Quassia-water, and thrips and scale by judicious syringing, or dipping in solutions of petroleum or Lemon-oil insecticide. Avoid fumigating ferneries. Suitable plants for growing with Ferns in the exotic-house are the Rex or ornamental-foliage varieties of Begonias, which, if planted out on rockwork at the foot of a wall, in rustic-work, or in pots on brackets, are very attractive. Attend to hardy and British Ferns in pots, and those planted out in houses, potting any that may require it in a compost consisting of peat, leaf-mould, and sand. The evergreen varieties are indispensable for winter decoration in cold rooms. Do not over-water the deciduous species, but afford them plenty of air, and shade them from bright sunshine. Where no hardy fernery exists, these species should be grouped during the summer under the climbers in the conservatory or the greenhouse. Ferns planted in baskets will need almost daily attention, and when they are not too large, they should be dipped in the water-tank, instead of being watered with a water-can, sprinkling them overhead in the afternoon. Blank spaces in baskets amongst Selaginellas should be filled as they occur, and strong-growing species not allowed to push out the more delicate ones.

THE ORCHID HOUSES.

By W. HOLMES, *Gardener, Pickering Lodge, Timperley.*

GENERAL HINTS.—The greater number of the plants are making growth, and from now onwards the following temperatures may rule, viz., East India-house, 70° at night, and 75° to 80° by day; Cattleya-house, 65° at night, and 70° by day; Dendrobium-house, 70° at night and 75° by day, running up at closing time, which should be early in the afternoon to 80° or 90°, with the atmosphere well charged with moisture. Some difficulty will have been experienced in keeping the cool Odontoglossum-houses cool enough for the past month, even with plenty of air afforded at the top and bottom, the roller-blind let down, and the floors, &c., well damped three times a day. I do not fear any ill-consequences if the thermometer should reach 70° at mid-day, provided the houses are well looked after. Should the weather become colder, a few degrees less will do no harm, but fire-heat must still be used in some of the houses. Blinds should be let down early in the forenoon over Phalænopsis, Cypripediums, Odontoglossums, Vandas, Aërides, and, in fact, all Orchids with tender leaves. Aërides odoratum, A. crispum, A. Lobbii, A. Fieldingii, A. Veitchii, also some of the Saccolabiums, such as S. ampullaceum, S. Blumei, S. præmorsum now showing bloom-spikes, are apt to suffer from the attacks of cockroaches, and need careful watching, the insects devouring these whilst still small, and in the axils of the leaves. Vanda tricolor in flower or approaching flowering, needs similar treatment to that afforded the Aërides, and should have a good supply of water at the roots, and the house kept well moistened. Vanda Denisoniana, a plant just pushing up its flower-spikes, is not often seen in good health, but if it be grown along with V. tricolor, it does fairly well. Vanda teres, V. t. Andersoni and V. t. alba, if they were suitably treated last season and well rested afterwards, will be approaching the flowering stage, needing to be well watered and syringed three times a day, and have full sunshine. Our plants never get any shading whatever. Vanda t. Andersoni is a freer bloomer than the type. Vanda Hookeriana, V. Kimballiana and V. Amesiana grow well under the same kind of treatment as V. teres.

THE FLOWER GARDEN.

By T. H. CRASP, *Gardener, Canford Manor, Wimborne.*

ROSE GARDEN.—Examine at regular and short intervals the young shoots upon the Roses, destroying all caterpillars and injurious insects found thereon. Even at this early date many young shoots will be found which are "blind," that is flowerless, especially on Tea Roses trained to walls, &c. Should the Rose-mildew appear on the leaves, dust the plants with flowers-of-sulphur, or syringe them with Gishurst's Compound-soap in solution with water, at the rate of 2 to 3 oz. per gallon. The Rose-aphis also, if not quickly destroyed by dusting the shoots with tobacco-powder, does much harm. When the shoots get longer and more pliable, they can be dipped into a weak solution of tobacco-water, or any other approved insecticide. The application of strong manure-water to the roots of outdoor Roses at this season has a beneficial effect, particularly if exhibition blooms are wanted.

HINTS ON WORK IN GENERAL.—Now that most of the beds of spring flowers are past their best or finished, the beds may be cleared in preparation for their summer occupants. Plants of Arabis, Myosotis, Primroses, Daisies, &c., should be lifted, divided, and planted on a piece of well-prepared ground in a half-shady situation, copious supplies of water being afforded whilst the weather continues

dry. By this means good plants are obtained for next year's spring bedding. Previous to bedding-out anything, the Box and other edgings should be put in order, then the ground may be dug and otherwise prepared for the summer bedders, the planting out of which may be begun in about the third week of this month, first planting the hardier kinds and holding tender ones back for a week or two longer.

HERBACEOUS BORDERS.—These have begun to be gay, plainly showing the value of such hardy perennials as Pyrethrum roseum and its varieties, Pæonies, Doronicums, Papaver nudicaule, P. orientale, Asphodels, Iris germanica, Erigeron, &c., which are now making a fine show in southern gardens in spite of the trying weather. All plants which have made tall growth should be neatly staked before they come into bloom, and Pæonies which have heavy heads of flowers should have each flower-stem separately staked and secured; but Pyrethrums, and similar weak growers, may be secured by means of two or three twiggy pieces of Birch stuck round each clump. The herbaceous borders will stand in need of being occasionally heavily-watered with weak manure-solution. Where hardy annuals have been sown where they are to flower, thinning out the weaker plants, and giving them plenty of space in which to grow, will need early attention. If slugs are troublesome, make use of a mixture of soot and quick-lime. The blooming season of spring-flowering bulbs is drawing to a close, with the exception of a few Narcissi poeticus and p. fl.-pl., and the proper labelling of bulbs that are to be left in the soil should at once be done.

FRUITS UNDER GLASS.

By M. TEMPLE, *Gardener, Carron House, Stirlingshire.*

PINES.—Those plants which were started at the beginning of the year will be approaching the ripening period, and till they show signs of changing colour, will require a judicious application of moisture at their roots; especially will this be the case if the pots are undersized; and liquid manure may be given at every alternate watering. A check to the fruit when swelling, causes premature ripening and very inferior quality. Shut up with 95° to 100° with bright sunshine, and moisten every part of the beds and floors—but heavy overhead syringing should be avoided. As soon as the fruit is cut, let the soil be well moistened, in order to keep suckers unchecked. Not more than one or two should be allowed to remain on each plant. A liberal shift may be given to young stock at this season when well rooted, as they have the growing season before them; be careful that the balls of soil are moist when potted, and afterwards but little watering will be required till the roots have got well into the new soil. Bottom-heat need not exceed 85°; ventilate early in the morning, and the maximum temperature need not exceed 85° by sun-heat. Reduce fire-heat as much as is practicable. In span-roofed houses more attention to atmospheric moisture is necessary than in flat-roofed brick-pits. If strong suckers only are potted, it will tend to maintain a regular succession of fruit.

VINES.—Those canes in pots which have grown to their full size, and are to supply early fruit next season should be carefully stopped, and exposed freely to the sun and air, and watered regularly till the rods are brown and hard. The foliage must be maintained in good health. Newly-planted Vines may have a high moist temperature till growth is free and vigorous, then an increase of air. Allow laterals to grow freely till the space is filled, but do not let them become crowded. The thinning of late Grapes must be done severely, so that when the fruit is ripe, the berries will not press against each other. Large varieties, like Gros Colman, should be severely thinned; we never think 1½ inches apart too much for those which are to keep till March. Crowding of foliage prevents proper maturation of the fruit, and is attended by bad keeping. Dustings of soot at shutting-up time over the surfaces does much to check red-spider, and seems to nourish the foliage. Watering at the roots now requires special attention, especially if the soil is light, and the position elevated.

FIGS.—Attend well to stopping and thinning the shoots; expose the ripening fruit well to the sun and air; and water the soil moderately at this stage. Moderate cropping is essential to fine fruit of high flavour. Syringe later crops freely after bright sunshine, and shut them up with a temperature of 85° to 90°; give liquid manure liberally to trees which have their roots confined. Mulching may do much to keep roots healthy, and to draw them upwards, but gross unfruitful growth must be avoided.

THE HARDY FRUIT GARDEN.

By T. TURTON, *Gardener, Maiden Erlegh, Reading.*

PEACH AND NECTARINE TREES.—Those trees which have been kept free from aphis, and are making a healthy growth, will require early attention in the matter of securing leading shoots to the walls; and disbudding should be completed, as well as the pruning-back of gross-growing shoots to a lateral growth at the base of the shoot, so as to throw vigour into weaker shoots. All trees should be encouraged to make early growth by watering the soil and syringing the tops daily when the weather is genial. Early growth in any kind of season has a better chance of being matured than late growth. These remarks apply to young trees which may not have come into full bearing. Old trees which have set heavily should now have the crop lightened by thinning out, first the badly-placed fruits, and then the gradual removal of others. The use of the syringe or garden-engine will clear the trees of yellow leaves, &c. For the present, defer the finishing of the disbudding of these fruit-bearing trees till growth is freer. In the south, coping boards which have been used to ward off frost may now be removed, and so long as the nights remain cool, as at present, the syringing of the trees should only be performed in the morning. The weekly syringing of the trees with soap-suds and tobacco-juice should not be omitted where either green or black aphis are present.

PLUMS ON WALLS.—All Plum trees which I have observed this season have set heavy crops of fruit, and timely thinning of the fruits will be much required, especially the free-bearing Denyer's Victoria, Pond's Seedling, and Early Orleans. Early thinning is always a benefit, those fruits left growing to a good size before they commence to stone. A strong pair of grape-scissors is a suitable instrument for thinning all kinds of fruit, but it must be a strongly-made pair—the ordinary Grape-scissors obtained from the seedsmen are not strong enough for this purpose. Prune back gross shoots not required to be laid-in, and examine the trees carefully for grubs or any chrysalids which may still be left on them, afterwards affording the trees a heavy syringing with a weak solution of soft-soap 2 oz., tobacco-juice half-pint, to a gallon of water, and keep the soil of the border moist. By-and-by, the trees that are heavily cropped should have a few applications of liquid manure.

PRUNING AND TRAINING YOUNGER TREES should have early attention in the matter of securing the leading shoots, but avoiding overcrowding. The few shoots trained in from each branch when forming the framework should now be reduced to one, except where space admits of two shoots being taken from a branch here and there. Prune back the remaining shoots to two or three leaves, at intervals of about a week, first taking the strongest of these, and encourage a kindly growth in the trees by keeping aphis in check, as advised in the case of older trees.

BUSH APPLE TREES.—Look over these regularly for grubs and caterpillars, examining each truss carefully; also removing all dead bloom or that which has failed to set, thus depriving the insects of their hiding-places. It is only by labour being thus spent in a season like the present that a crop of perfect fruit is likely to be obtained.

THE KITCHEN GARDEN.

By H. C. PRINSEP, *Gardener, Buxted Park, Uckfield.*

GENERAL HINTS ON CURRENT WORK.—One of the most time-consuming tasks of the gardener during the summer, when the family goes to town for the season, is packing produce for town consumption. Those who have to send long distances by goods train are often hard pressed to be in time, if the train starts at an early hour. And one likely consequence of this is, that the packing does not get the proper amount of attention, and the various items do not arrive in town in the most satisfactory condition. Green vegetables are often cut in the heat of the day, when their leaves are flabby and warm. They are then taken to a shed, where perhaps they lie for an hour or two, and lose still more of their juices. Where supplies have to be despatched by evening trains, Cauliflower, Cabbage, Lettuce and Spinach should be collected in the early morning, whilst the weather is warm, and taken to a cool cellar or shed, with an earthen floor, sprinkled lightly with clean water and covered with a mat. These kinds of vegetables should be gathered with a few outside leaves, and slightly bound together with bast. Peas are likewise better eating if gathered before the pods get heated by sunshine, whilst such things as Turnips, Carrots and small salads should be reserved till the very last. In packing, be careful to place bundles of Asparagus, Cauliflowers and Cucumbers, and the like, so as to avoid their being crushed by the harder kinds. Take particular care to have the hampers well filled, so as to prevent displacement in transit, for they are often dropped down, or turned over and over by the porters without the least regard being paid to their contents. It will be seen that unless the packing be well done the contents of the hampers will not arrive in a condition creditable to the gardener. Packing may seem a simple performance, but much unpleasantness so often arises through supplies not arriving in a satisfactory manner, that it would be well if all gardeners would give the matter their best attention.

VEGETABLE MARROWS.—The Custard and other varieties of Vegetable Marrows are much in demand in some places, and those who know this would do well to make preparations for obtaining a continuous supply for as long a time as possible. Plants which were raised in March, and grown in frames, will now be in fruiting, and others later raised should be in readiness for transplanting. If no heaps of warm manure are available for giving the plants a start, a trench can be taken out on a piece of ground, filled with manure, which may be covered to a depth of 6 inches with soil, and on this the Marrows may be planted, one or two under a hand-glass. If space be limited, the plants may be trained to rough lattice-work, where the flowers, being exposed to the sun, will set freely. Seed may now be sown in the open ground, or in any sunny corner where the plants may have room to freely ramble. Copious supplies of water are needed in dry weather, to keep the plants when strong and growing fast in a flourishing state.

TOMATOS.—Owing to the warmth and sunshine, plants raised with a view of being grown against walls out-of-doors have grown apace, and the space allotted to them seems to be insufficient. It is not yet safe to transfer them to the open, and it will be better to repot them, still keeping them in the frames or houses till all danger from frost is passed. Heavily-cropped plants will be benefited by liberal supplies of manure-water at the roots, the foliage and the atmosphere of the houses in which they are growing being kept dryish.

SUCCESSIONAL CROPS.—The unusual weather conditions have greatly interfered with work in the kitchen garden, and seeds of Carrots, Parsnips, Beet, and the like do not germinate unless the ground be watered, and if rain does not soon fall, there will be gaps in the supply. Celery, Cauliflower, and other vegetables that have been well supplied with water, have grown fast, and are ready for planting before the ground is prepared for them.

THE APIARY.

By EXPERT.

THE EARLY SEASON.—The extraordinary forwardness of this season will be long remembered by the number of swarms in the month of April. The earliest that has been recorded was at Cole Green, Hertford, on the 9th of that month, others being reported at various places on the 20th and subsequent days. Honey has been literally pouring into the hives lately from Apple, Horse-Chestnut, and Hawthorn blossom, and supers are in many cases full, and ready for removal. It will be well for bee-keepers to examine the brood chambers of hives, and remove from them as much honey as possible, as it will be found in many instances that the brood combs are so full that the queen is crowded out, and has not sufficient space for depositing eggs. There at present appears to be every indication of a good season for honey, the only immediate danger being that if rain does not come soon aphides and the consequent honey-dew will be in the ascendant. Weak stocks have had every chance this year, owing to the splendid weather and abundant natural stimulation, to get at full working strength by the time white Clover is in bloom, and may be expected to yield a profit.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—*All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for contributions, or to return unused communications, or illustrations, unless by special arrangement.*

PLANTS, &C., TO BE NAMED.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.*

LOCAL NEWS.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

NEWSPAPERS.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

SATURDAY, MAY 13—Opening of the Gardening and Forestry Exhibition, at Earl's Court.

WEDNESDAY, MAY 17—Royal Botanic Society's First Summer Show.

THURSDAY, MAY 18—Orchid Show, at Earl's Court.

FRIDAY, MAY 19—Royal Botanic and Horticultural Society of Manchester Grand Orchid Exhibition, from 19th to 25th inclusive.

SALES.

TUESDAY, MAY 16—Langton House collection of Orchids at Protheroe and Morris' Room, (three days).

FRIDAY, MAY 19—Orchids from Messrs. F. Sander & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—54°.8.

The Dropping of the Buds of Peaches, &c.

THIS is a calamity to which the Peach tree, as raised and grown in gardens in this country, is particularly liable, and as to which the best gardeners are at variance in regard to the cause and the remedy. It will occur in trees in a forcing-house, in pots in the orchard-house, and on open walls. The mechanical conditions of the soil, apart from its special nature, may, and do seem to offer a probable cause, in so far as at one time the soil may become exhausted of its humus by the previous heavy draughts on its store of food supplies by a tree in luxuriant growth, or from an inadequate amount of water present in it, especially when the buds are nearing their full development in the autumn.

To go into the woods and forests for an illustration, we see something of this kind of effect in the sickening of, say, Oaks in a plantation that have been greatly thinned out, where previously the trees have grown healthily and well. The excessive thinning has let in the sun; there is no dense canopy of foliage to prevent rapid evaporation of moisture from the soil, and the exposure hastens the decay of the covering of leaves and leaf-mould, and other soluble plant-food on and in the soil, with the effect of hastening growth at the top. After a few years the vigorous growth of the crown and stem-growths has exhausted the stores of plant-food in the soil, the upper layer being without sufficient protecting covering, dries out quickly in the summer season; and then follows a course of starvation, with the subsequent result, if there is no undergrowth coming on to supply the shade that has been lost, that the trees die back at the top, and sometimes a whole plantation will die out.

Is there not in the case of our Peach trees something that in its initial stages resembles the unfortunate results of inordinate tree thinning? In the case of trees on a wall, or those exposed to the full blaze of the sun in a Peach-house, we have something that is analogous to the over-thinned trees with an uncovered soil, exposed to the fierce rays of the sun, evaporating its moisture, and causing a rapid decrease of the manurial portions of the same, at the same time that a large amount of growth of shoot and stem is encouraged, and an exhausting crop of fruits taken.

The gardener who considers all these points, can, and does try to mitigate the evils that are likely to arise from his special, and we may say unnatural, or at least artificial, proceedings; for he copiously waters the soil, not only during the season of growth, but afterwards, when the trees are about to enter their winter's rest; and if it be a light soil, and therefore readily parts with its moisture, he mulches it with stable manure in sufficient quantity to prevent undue loss by evaporation, but not to seal it against the entrance of air.

Loss of buds may arise from a crowded state of the shoots, in which case only those shoots which are least crowded, such as those at the extremities of the longer branches, would develop good fruit and wood buds. The crowded shoots would produce buds small in size, deficient in vigour, and certain to be ill-matured at the end of the season, and this would be equally true of trees in houses and on walls. It will be obvious to anyone that crowding the shoots cannot pay, and the best growers have for many years past advocated a judicious thinning of the shoots, and an early commencement of the operation, together with its gradual performance. This year the lessening of the number of shoots on a Peach tree was begun, owing to the extreme earliness of growth, so early as the second week of April in southern parts of the country, and a finish will be made of the heavier portion of the work before the end of the present month. Of course, there is some thinning and cutting back of over-strong shoots to be performed even so late as the beginning of August.

Another cause we may advert to as affording a reason for bud-dropping, is a soil with inefficient drainage, or none at all. There, the excessive moisture present prevents the ingress of air, consequently keeps the soil cool, tends to prolong growth to a late period, and prevents its attaining to full maturity. In such soils the Peach seldom pays to grow, for unfruitfulness is sure to intervene when the roots have penetrated to any depth; and in such cases, nothing short of thoroughly draining the border and replanting the trees, perhaps renewing some of the staple, is of any use.

There is one aspect of the case which we may here say a few words about, and that is the stock on which the Peach and Nectarine should be budded when the tree is to occupy a place on a south wall on warm dry land, or in the peachery. The Peach and Nectarine differ from most other kinds of fruit in being "worked" on a plant which in many points differs greatly from themselves. In the case of the Apple, we make use of the crab, the progenitor of all Apples, or of the Doucin, the Burr Knot and seedling Apples taken from all sorts of sources, without regard to suitability, because, perhaps with the exception of the Doucin, a "dwarfing stock," it does not much matter, they being all of them Apple trees, and, therefore, nearly related. It is the same with the Plum, only Plum stocks are employed; and the Pear, with the exception of some score or two of varieties which grow on the Quince, is not happy if not united to another Pear. With the Peach this is different, for in this country it has become the mode, because found the best adapted to our climate in general culture, to work it on the Plum stock, a near relation probably some long ages since, but now widely dissimilar in fruit, foliage, root-formation, and many other points.

The usual stocks for the out-of-doors culture of Peaches, &c., are the Muscle, which comes pretty true from seed, but is best raised from stools, the St. Julien and the Damson, this last the worst. As is well known, the Plum stock tends to fruitfulness in the Peach or Nectarine, and in our moist climate is preferred to the Almond or the wild Peach stock. It is, however, not so certain that in our Peach-houses, where artificial conditions necessarily prevail, that the Plum stock is as well suited as those stocks that are found to suit the plants in countries with climatic conditions, closely resembling those we maintain in our forcing-houses. And may not this, under certain conditions of soil and treatment, account for the untimely fall of wood and fruit-buds?

In the Plum we have a plant that possesses abundance of small roots, but these naturally lie in the greater number near to the surface, and good fruit-growers endeavour to have them there, and transplant or lift the trees at intervals of three or four years with that intent. So far so good, but the bringing up of the roots of the Plum near to the surface of the ground where any drought prolonged for only a few weeks might act injuriously on the roots, and, consequently, on the stepchild drawing its nourishment from them, seems to be a practice that is not without some element of danger. It is a question whether the Peach or Almond would not, at least for trees in forcing-houses, and very warm porous soils in the open air, be the more suitable stocks to make use of. Both of them are found to succeed better as stocks for the Peach in France, where the hard-shelled sweet Almond, *Amandier doux a coque dure*, is preferred; the warmer parts of the Peach-belt in the United States of North America, Austria, Hungary, and south-eastern Europe generally, all of them countries in which the Peach is grown as an orchard tree.

The roots of the Peach and Almond are few in comparison with the Plum, and have a natural tendency to stretch downwards in search of moisture, hence their greater adaptability for countries with warm dry summer climates. In all of these the trees are cropped to their utmost capacity whilst they are young and vigorous, and last but a few years, say, ten to twelve; in the United States of America, not so long, on account of that much-dreaded disease, the yellows. At about that age the fruit crop becomes smaller, and the trees are cleared out, young plantations taking their place. Here, there are often qualms about destroying old trees, and in spite of the obvious incurability of the weakness of old age, trees are kept alive long after they should have found a place on the rubbish-heap. In fact, the retention of old and worthless fruit trees amounts, in some gardens, to a superstition, and if any one who reads this note has doubts of its correctness, let him visit the old gardens in his neighbourhood, and judge for himself.

The roots of the Peach and Almond must not have their natural downward tendency curtailed by cutting off tap roots, as is practised with the Plum stock, or its capacity to support a tree in the comparatively dry soil and dry air of the Peach-house would be reduced below that of the surface-rooting Plum, and ill-health follows; nor should it be done when these stocks are used in dry soil and sites out-of-doors, for the same reason. At the most, the tap roots whilst at a pliable age, may be bent as much in a horizontal direction as may be without breaking them; but this will not effect much, and the points of these roots—of which there are always several on a tree, will again soon take a downward direction. This fact will determine the depth of the Peach border. It should not be less than 3 feet where the trees stand; although there is no reason that it should be so deep over the whole area, and it may slope off to 18 inches at the sides or front, or the top may be nearly level, and the bottom of the border slope downwards towards the wall, or that part where the trees stand, and be provided with a drain at that side to carry off the water. In fact, in making borders for Peaches and Vines, there are good reasons for elevating the artificially made border-bottom at the point farthest from the plants, and placing the drains where the soil is the deepest, not where it is, in most cases, shallowest. By so doing, the extending roots, instead of ever tending downwards away from warmth and air, would be kept at a short distance from the top of the border, a part in which gardeners mostly like to find them.

Fig. 85.—Japanese garden. (see traveller's notes, p. 568.)

Linnean Society.—At the meeting of this Society, held on Thursday, May 4, Professor Stewart, President, in the chair, Messrs. W. B. Bottomley, John Percival, and R. S. Standen, were admitted, and the following were elected, John Buchanan, C. H. Nicholls, and as Foreign Members, C. Claus and C. de Candolle. Professor J. B. Farmer exhibited under the microscope some preparations showing attraction spheres in Hepatic spores, and gave the results of his recent researches on the subject. Mr. Thomas Christy exhibited some curious variations in foliage in plants of Sterculia from Brazil, reared from the same pod; and showed also a specimen of Erythroxylon coca in fruit. Mr. W. B. Hemsley showed two British plants which were interesting on account of the localities, namely, Empetrum nigrum from Dorset, where Mr. C. B. Clarke had seen it growing on Poole Harbour Spit, though it had not been included hitherto in the county flora.

Royal Botanic Society.—The first of a series of summer lectures on botanical subjects was given on Friday, May 5, in the gardens of this Society by Professor Groves, F.L.S. Taking the subject of "Ferns and their Structure," the lecturer dealt, in a popular way, with the peculiarities of growth which separate this family from other plants, and enable us to combine the three thousand, or more, species known, into an easily-recognised and distinctive natural group. The succeeding lectures will be given on the Fridays in May and June, and are free to all visitors to the gardens.

The Gardeners' Orphan Fund.—The monthly meeting of the committee took place at the Horticultural Club on the 5th inst. The chairman, Mr. William Marshall, presiding, there being as usual a good attendance. The hon. secretary announced that the dinner receipts amounted to £492 6s. 6d., in addition to the promise of £100 from the directors of

the Gardening and Forestry Exhibition at Earl's Court. Hearty votes of thanks were passed to Baron F. de Rothschild, M.P., for presiding at the dinner, also to Sir Trevor Lawrence, Bart., Sir J. T. D. Llewelyn, Bart., and N. N. Sherwood, Esq., and to those who furnished flowers for the decoration of the dinner-table—Messrs. Wills & Segar, B. S. Williams & Son, H. Cannell & Sons, J. Walker, J. Laing & Sons, J. Smith (Mentmore), G. Wythes (Syon), and W. G. Head (Crystal Palace).

DUNDEE HORTICULTURAL ASSOCIATION.—The monthly meeting of this Association was held in the Y.M.C.A. Rooms on Friday evening, May 5, Mr. JAMES MOIR, Vice-President, in the chair. A paper was read to the meeting by Mr. ROBERT GROSSART, Binrock Gardens, on "Cool Orchids." At the close of an excellent paper, Mr. GROSSART received a hearty vote of thanks. A variety of flowers in season were shown, including some Orchids from Mr. GROSSART, the gardener at Binrock.

HOW PLANTS ADAPT THEMSELVES TO CIRCUMSTANCES.—The forms of vegetable life are capable, just as animals are, of adapting themselves to a greater or less extent to altered circumstances or conditions. A curious experiment illustrative of this fact has recently been made by J. BOKORNY (vide *Chemiker Centralblatt*, 1892, ii., p. 80), who has shown that plants which have been deprived of starch, and placed in an atmosphere that contains no trace of carbonic acid gas, are capable of forming considerable quantities of starch if they are fed with the sodium hydrogen sulphite compound of formaldehyde. In order, however, that this experiment may succeed, the plants must be placed in a strong light; in the dark no formation of starch takes place. A detailed account of this work is given in the *Landw. Jahrbuch*, xxi., pp. 445—465.

SCOTTISH HORTICULTURAL SOCIETY.—At the examination held at the close of the lectures in science and hardy fruit, held by the Scottish Horticultural Association, the leading prize for science was gained by Mr. ERNEST WALLER, of Messrs. METHVEN & SONS, Leith Walk Nurseries, Edinburgh; Mr. OSWALD CLARK, Halliburton Gardens, Cupar-Angus, being the winner of the 1st prize for hardy fruit. Mr. E. WALLER also gained the Silver Medal given by the Scottish society to Dr. WILSON'S horticultural class at the Heriot-Watt College.

BRESLAU BOTANIC GARDEN.—Dr. PAX, hitherto engaged at the University of Berlin, will assume the Directorship of the Botanic Gardens at the University of Breslau, rendered vacant by the death of Professor Dr. PRANTL.

SODIUM AS A PLANT FOOD.—In pure chemistry the properties of sodium and potassium are very closely related, but in the practical application of compounds containing these elements great differences are observed. However, some recent researches by A. ATTERBERG (*Expt. Stat. Rec.*, iii., p. 554) show that in regard to the food of plants, sodium and potassium, though not capable of mutual substitution with equal advantage, possess some properties in common. In short, sodium compounds may be of considerable advantage where potassium is deficient. This observation has an important commercial consequence, since the large amount of sodium present in many of the standard manurial salts can now no longer be considered as useless.

THE EARLY SEASON.—We have received from Mr. WILLIS, of Hollowmead Gardens, Bishopsteignton, Devon, some Peas, William the First, rather over than under ripe. Also a shoot from a Peach tree on outside wall with fruits stoning, and several other indications of the unusual character of the season. Mr. ELY NITTLEBED, Henley-on-Thames, also sends very fine samples of Pea, Sutton's Ringleader, with a few notes which we hope to publish next week.

M. LINDEN'S PROTEST.—We have received a copy of the letter addressed by the President and by the Secretary of the Société Royale d'Agriculture et Botanique of Ghent to the Managing-Director of the "Horticulture Internationale" of Brussels, with reference to the protest against the unanimous decision of the jury at the late Exhibition at Ghent. The official reply to M. LUCIEN LINDEN states, that the decisions of the jury are beyond appeal. A copy of this letter has been sent to each member of the jury in the section in question, and M. LINDEN'S protest has been deposited in the archives of the Society.

DRACÆNA SANDERIANA.—We are requested to publish the following letter relating to this plant:—"Will you have the kindness to publish, as soon as possible, the following notice on Dracæna Sanderiana."—The Professor of the Royal Botanical Garden, A. ENGLER.

"In 1888, Mr. JOH. BRAUN was sent by the Imperial German Government to explore the flora of the German Cameroon boundary. He gathered several specimens of a Dracæna named provisionally Dracæna thalioides, a specimen with green leaves, and a single specimen with variegated ones, which he succeeded to bring home alive. By the contract made with the Imperial Government, Mr. J. BRAUN could reclaim one specimen as his legitimate portion of every species he had gathered in several specimens; all the 'Unica' were in possession of the Government, which charged the Royal Botanical Garden at Berlin to cultivate all the Cameroon plants. The Dracænas were doing so well, that some time later cuttings were made which grew very quickly. Mr. BRAUN, then returning from his journey to the Comoro Islands and Madagascar, asked and obtained, in exchange of other plants, several of the cuttings, which he could dispose of as he liked, which he sold to Mr. FRANZ BLUTH, nurseryman, Steglitz, Berlin, who sold on his part the whole stock to Mr. F. SANDER & Co., St. Albans. Some time afterwards, Mr. BRAUN demanded for a second time a few specimens of the variegated Dracæna in exchange for a collection of leaf-funguses and Mushrooms from Madagascar; also these specimens were purchased by Messrs. F. SANDER & Co. In this manner, and only by the mediation of the late Mr. J. BRAUN, and only in exchange of objects of our scientific collections, specimens have found their way in private collections. That these plants were purchased by Mr. SANDER, and that these plants were named Dracæna Sanderiana, were not known to the officers of the Royal Botanic Garden before May 1. After the last Ghent Exhibition, where Mr. F. SANDER obtained the 1st prize for a little collection of new plants (one of which was the said Dracæna thalioides fol. variegat. = D. Sanderiana hort.), a traveller of Mr. M. LINDEN, who had visited our Botanic Garden, asked fifteen different species (including our Dracæna), and offered to pay 500 marks for the whole. I declined to take money, because it is use [the custom] that the Royal Botanical Garden takes plants for plants, and I mentioned several plants, the acquisition of which is of some interest for the Royal Botanical Garden; and I declare that as far as such a transaction can be made without assuming the character of trade, the exchange of the said plants has been made. The traveller of Mr. LINDEN wished to take the Dracæna with himself, and I allowed it harmlessly. Some days afterwards I was informed by Dr. F. KRÄNZLIN, who has been at Ghent, that the plant in question, of which we possess still several specimens, was of the same kind as those of Mr. SANDER'S novelties, and that Mr. SANDER had purchased the plant believing that Mr. BRAUN had the right of possession for the whole specimens. Indeed, Mr. BRAUN had not any right of possession. But not wishing to hurt Mr. SANDER, and as I in my official position, never take part in questions of merely mercantile interest, I demanded Mr. LINDEN—

"1. To set right his advertisement in the *Gardeners' Chronicle*, April 29, concerning Dracæna Sanderiana, where he says, 'We have *purchased* at Berlin,' &c.

"2. To send back the plants. As Mr. LINDEN refuses to do so, I am obliged to publish the matter-of-fact."

DR. JANNICKE, second librarian and Professor of Botany at the Senckenberg Institute, Frankfort-on-the-Maine, is recently deceased. Prof. MOBIUS, of Heidelberg, has been selected to succeed him at Frankfort.

THE IMPERIAL INSTITUTE.—This gigantic Institute, which was commenced in 1886 to commemorate the Jubilee of Her Majesty's reign, was successfully opened on Wednesday, the 10th inst., by the QUEEN in person, in the presence of the greater part of the Royal Family, and a very large and distinguished company.

VIOLAS.—We have received from Mr. JNO. FORBES, of the Hawick Nurseries, Roxburghshire, N.B., a box of beautiful Violas, in the most unaccountable variety. Mr. FORBES says that through absence of rain, the blooms are rather smaller than usual, but the plants are flowering in the greatest profusion. The shades of colour in some of those we received are quite charming, and perhaps more striking than usual through the presence of abnormal amount of sunshine.

FLOWERS AT CHISWICK.—The Violas at the Royal Horticultural Society's gardens are now very good, but the dry weather is all against their continuing in fine condition for any considerable time; climbing Clematis also present a special feature. The dwarf French Cannas, so brilliant in the colour of their flowers and generally dwarf in growth, were noted in many varieties. Primula Sieboldi laciniata-rubra, brilliant purple-rose; and P. S. Mrs. Ryder, a blush; P. S. grandiflora, interior French white, exterior deep rose—large bold spikes, a great favourite; P. S. Elysée, of a rich purple-violet tint, are admirable varieties. Some showy alpine Auriculas were noted in flower. The early Irises observed in bloom were I. Chamæiris, I. biflora, and I. pumila.

SULFOSTEATITE CUPRIQUE.—We have received from M. JEAN SONHEUR a circular with numerous testimonials from well-known directors of large gardens and nursery firms on the Continent, setting forth the virtues of the above invention in the treatment of vegetable and animal parasites on garden and farm plants. According to the inventor, it can be employed efficaciously against mildew on Roses, Peaches, and Vines, the species of Peronospora attacking Tomatos and Potatos, the rust on Asparagus, and Peach-blister or curl; and against the Asparagus-beetle and fly; aphis of all kinds, Turnip-fly, &c.; besides other purposes to which it may be put. The circular certainly does not err on the side of want of universality of the uses of the powder. In this country it is not much known, the Bouillie Bordelaise having as yet had the preference. The powder, which is harmless to mankind and animals, is applied by means of a pair of bellows, with a long nozzle attached or not, a reservoir containing a supply. The only competitor which Sulfosteatite has at present is the aforesaid Bouillie, than which it is cheaper to buy, and easier of application. Its other advantages are, that it can be used at once, being ready prepared, needs no stirring about, and is cleaner and easier in use than any other preparation for the same, and, in consequence, it costs but little in labour. Moreover, a powder-distributor is much cheaper than a syringe or water-distributor. Have any of our readers experience of the efficacy of the remedy?

THORNS AT RICHMOND AND GREENWICH PARKS.—The Thorns are very beautiful in these parks, and the show of bloom seems even more profuse than last year, which was noteworthy in this respect. Both parks possess many fine specimens, but those in Greenwich Park are more conspicuous, as they are planted in large groups on the brow of the more hilly portion, so that a cloud of colour is got by this arrangement. Little damage is inflicted, although the park is frequented by thousands, and each specimen is full of health and vigour. It is to be hoped that good care will be

taken of these fine old trees, remnants of former times, when this was a royal park. It has been many years dedicated to the use of the public, and commands a wide view of the Thames. One of its chief glories, however, are the Thorns.

FRUIT GROWING AT DUNKELD.—A correspondent writes enthusiastically of Mr. FAIRGRIEVE'S methods of disbudding Peach trees, well known to Scotch gardeners, and when I saw the trees in the middle of last month, the trees in the houses were covered with healthy foliage and bore a fairly heavy crop of fruit. Mr. FAIRGRIEVE does not heavily crop his trees. Out-of-doors on walls, which are furnished with canvas blinds fixed to rollers, the trees were pictures of health and promise. The Apricots, of which he is an easy first as a cultivator, were likewise in the finest condition, with fruits as a large as a Hazel-nut. Round about the trees are placed slates or a circle of large boulders, to keep the ground moist and tempt the roots to the surface.

THE CHEMISTRY OF APPLES AND PEARS.—In a recent investigation by P. KULISCH, on the chemical composition of fruit, he observed that where Apples are detached from the tree, cane-sugar continues to be produced in the pulp at the expense of the starch, and finally this sugar becomes almost completely converted into another form known as invert sugar. He considers that no relation exists between the fertility of the tree and the percentage of sugar in the fruit; although the number of Apples borne by any given tree has a great influence on the weight of single Apples. Large Apples, however, contain a greater percentage of sugar than small Apples gathered from the same tree. KULISCH also found cane-sugar in Pears that had been stored away to ripen. He states that Currants, Gooseberries, Blackberries and Mulberries contain only traces of cane-sugar, whilst most stone fruits contain much. The paper in which KULISCH deals with this subject may be consulted in full in BIEDERMANN'S *Centralblatt*, xxi., pp. 700—702.

SOUVENIR DE LA MALMAISON CARNATION.—In Lord ROTHSCHILD'S garden, at Tring Park, a magnificent show of this fine flower has commenced, and a large quantity of succession plants in all stages will keep up the show for some time to come. The large early-flowering plants, which fill several houses, are well furnished with flowers and flower-buds, the lateral growths being more profusely furnished with the latter than usual. The annual production of such large quantities of this variety with unerring success is not an easy matter, but Mr. E. HILL, the gardener at Tring Park, accomplishes it in fine style.

PÆONIES.—The curator of the Botanic Garden, Cambridge, desires us to inform our readers that he would be glad to receive specimens of any Pæonies, grown under popular names, for the purpose of determining the species to which they belong, but cares least for those that are easily referred to P. albiflora, P. Moutan, or P. officinalis. He would also be glad of any specimens of known wild origin.

EARLY STRAWBERRIES AND CHERRIES.—Messrs. WHITE & Co., writing from Covent Garden to the *Pall Mall Gazette* of May 3, state that "on May 7 they received from the growers of Saltash, Cornwall, their first consignments of Strawberries grown in the open, being the earliest on record. The first consignment last year only reached Covent Garden Market on June 4, and some years they have known it to be June 10 and 12 before they came forward. They consider the season to be five weeks earlier than usual. They also on Monday, May 8, received the first large supply of French Cherries in flats, which did not come forward last year until May 16."

COLLECTIONS OF BRITISH PLANTS.—We note in the catalogue of a Birmingham bookseller, two items, which will be of special interest to our readers. The more important of the two is an extensive collection of British mosses, carefully preserved, and either mounted on superior paper, or between sheets of paper doubled. It comprises between 400 and 500 species, and contains a nearly complete set of types, from the late W. WILSON, author of the *Bryologia Britannica*. This collection was formed between 1839 and 1891, and the former owner estimates that the number of specimens exceeds 10,000, mostly named and made into cloth-covered books, which are labelled at the back, and enclosed in fifty-three cardboard boxes of neat design and octavo size. This superb collection of mosses is believed to have cost its late owner in various expenses, at least, £1000; but its value is now placed at forty guineas, which certainly cannot be said to be excessive. The second collection possesses a much less circumscribed interest. It includes Ferns, grasses, seaweeds, and flowering plants to the number of upwards of 1400 choice specimens, named, excellently preserved, many being mounted in sheets of paper, mostly tabulated, interleaved, and protected between sheets of paper doubled; the packages are distributed in eighteen large cardboard boxes made for the purpose. For this collection fourteen guineas are asked.

THE ROOT-NODULES OF ELEAGNUS ANGUSTIFOLIUS.—In 1891 a series of experiments were commenced by a committee of German experts, viz., F. NOBBE, E. SCHMID, L. HILTNER, and E. HOTTER, with the object of ascertaining the physiological meaning of the root-nodules of various non-leguminous plants. Of these plants Eleagnus angustifolius was taken as a type. The investigation lasted until the autumn of last year, and the deduction from the observed results has just been published in the *Landw. Versuchs-Stat.*, xli., pp. 138—140. The committee are of opinion that the possession of root-nodules enables the Eleagnus to utilise free atmospheric nitrogen. These nodules are really produced by an organism, which, however, is not of the same species as Bacterium radicicola.

STUARTIA PSEUDO-CAMELLIA, *Garden*, March 4.

HOME PRODUCE, IMPORTS AND CONSUMPTION OF WHEAT.

A most comprehensive and valuable contribution to our knowledge upon this extremely important subject has just issued from the able pen of Sir J. B. Lawes and Dr. J. H. Gilbert. The data extends over a period of forty harvest years, 1852—3 to 1891—2. The significance of the decline in the area under Wheat that has taken place in our own country during the last forty years, and the rapid increase in the imports from foreign sources of this staple food of the population of the United Kingdom, will be understood and appreciated from the following table, which shows the proportion which the imported Wheat bears to the total amount available for consumption.

Table showing Total Wheat (Home and Foreign) available for Consumption:—

YEARS.	Average annual total Wheat available for Food, Home and Imported. 72 flour = 100 Wheat, 60 lb. per Bushel.	Per Cent. of Total. From Home Produce.	From Imports.
Average for:—	Quarters.	Per Cent.	Per Cent.
8 yrs., 1852-3 to 1859-60	18,223,556	73·1	26·9
8 ,, 1860-1 ,, 1867-8	20,777,282	59·5	40·5
8 ,, 1868-9 ,, 1875-6	22,729,501	52·0	48·0
8 ,, 1876-7 ,, 1883-4	25,229,177	35·3	64·7
8 ,, 1884-5 ,, 1891-2	27,334,255	31·9	68·1
40 ,, 1852-3 ,, 1891-2	22,864,754	50·4	49·6

The figures in the first column show that the average annual aggregate amount of Wheat available for consumption in the United Kingdom was almost exactly one-and-a-half time as much over the last eight as over the first eight of the forty years.

The last two columns show in what proportion the increased demand has been met from home and foreign sources respectively.

Thus, whilst over the first eight-yearly period the home producer provided about 73 per cent. of the total requirement, over the last eight years he provided only about 32 per cent. In other words, over the earlier period he provided nearly three-fourths, but over the later less than one-third of the total requirement. On the other hand, whilst over the first eight years imports supplied only about 27 per cent., over the last eight they supplied about 68 per cent. of the requirement, or more than two-and-a-half times the proportion of the total over the last than over the first eight years; in fact, little more than one-quarter of the total over the first period, but more than two-thirds of the total over the last period. This was the case, notwithstanding that the last eight-yearly period gave a higher average yield per acre of the home crop than either of the four preceding periods. The truth is, that the less dependence on home, and the greater on foreign supplies, has been largely due to the increase of the population overcoming our capability of production; but, of course, largely also to the reduction of area under the crop at home as a consequence of greatly increased production for export in other countries, and coincidently great increase in our imports, and great reduction in price.

We know that the question is frequently asked and discussed, if it were not possible for our farmers to produce all the food-stuffs we require for home consumption? But the authors show most conclusively that with the rapid increase of population that has taken place, it would be impossible for our own country to produce all the Wheat required for consumption; and that should the increase in the number of people continue, it will be in a greater degree impossible in the future. It is pointed out, that the area under Wheat in the United Kingdom has during the last eight years averaged rather less than one-eighth of the total arable area; and that to produce all the Wheat required for consumption, more than one-third of our existing arable area would be required; or that, if the area devoted to other rotation crops were to continue to bear about the

same relation to that under Wheat as in recent years, the total arable area would have to be increased nearly three-fold, making in all much more than our present total arable and grass areas put together; or that if Wheat were to be grown on a larger proportion of the existing arable area, it could only be by the exclusion of the growth of other grain crops and stock goods, which would then, in their turn, have to be imported in larger quantities; or our stock must be reduced, and our imports of live animals, dead meat, and dairy produce be very much increased.

We refer those of our readers who may wish to study this important question more fully, to the complete paper, which may be found in the last issue of the *Journal of the Royal Agricultural Society*. *J. J. Willis, Harpenden.*

HOME CORRESPONDENCE.

UNDER THE APPLE BLOSSOM AND WHITE-THORN IN CAMBS, APRIL 25, 1893.—For nearly a week the white and purple Lilacs, Wistarias, and Cherries have been in full bloom; the cuckoo and nightingale in full-throated song; and now the Apples have pinked the landscape over so heavily that the White-thorn has rushed out to flank down the pink along every hedge-row with a broad spread of white in lieu of shadow. Assuredly, what with uninterrupted golden sunshine for months, and the fading of the Plum blossoms into fruitlets, the May is specially welcome. But it is its date rather than its ever-welcome purity and fragrance that makes it notable at the present time, fully a month ahead of its average time of blossoming. There is also not a little mystery, as well as precocity, about the fruit blossoming of the season. At first blush, it seems more a product of this sunful spring than the legitimate product of the last summer and autumn. Be the facts of our precocious fruit prospects what they may, there is no question about the prodigal—almost wanton—profusion of the blossoming. Apricots, Peaches, Plums, Pears, Cherries, bush fruits, and Blackthorns have been crowded full of fruit-blossoms. From whence and how came the prodigality of fertility? Out of the sunless summer, the dripping autumn of 1892? If not out of these improbable environments or fosterings, then from whence came or cometh this blossoming time so full of beauty, so rich in promise? I wish our Editor, to whom we are all so much indebted, could come and ponder over and crack this nut for us in the Apple orchards, and beneath the shadow of May-wreathed hedges in this April, which so far has only given us one shower throughout this sungirt spring, 1893. *D. T. Fish.*

MAY-DAY, 1893, IN EAST ANGLIA.—The sunshine and the long almost unbroken drought of two months between them, have pulled vegetation ahead of the calendar by a month or more. Hence the Lilacs, Wistaria, and the earlier Honeysuckles, and the Pyrus are all over and gone, as well as the Plum, Pear, and Cherry blossoms, Apples, Crabs, May, single and double Chestnuts, the earlier Clematis, all the Laburnums—unless the late Scotch; and even some early Roses are in blossom on this May-day, 1893. Let us hope that this abnormal precocity may not lead to a flowerless summer and an autumn bare of fruit. It is certain that neither hedgerows nor fields can be wreathed again with spotless garlands in May, or fields or orchards pinked anew with Apple or Crab blossoms this season. A few trees, including the Mulberry and the Oak, seem disposed to go by calendar instead of the forcing express of drought and continuous sunshine. As I write, on May 4, the sky is densely overclouded, and the symptoms point to a break up of the long drought at last, which so far may be said to have lasted two months with only a few drops in the long interval. *D. T. F.*

SUMMER PINCHING OF FRUIT TREES.—This is an opportune moment to discuss the question: "Does summer pinching of fruit trees conduce to their forming fruit buds in the manner generally understood?" I say emphatically, no. I have tried the plan extensively on all sorts of trees during the past few years. Pinching the surplus shoots in June, July, and again in September, and now that the same trees have been winter-pruned, I fail to see that the pinching, or summer pruning as it is sometimes called, has increased the production of flower-buds in the slightest. I know this experience is not in accord with the doctrine taught by some writers, but it is a fact, nevertheless, that there is far too much faith placed in the summer pinching of fruit trees to induce fruitfulness. The idea is broadly this, pinch off surplus growths to within 2 or 3 inches of the base, this will check the flow of sap, induce the base buds to plump up, and thus form spurs for future fruit bearing. Some go further than that, and say, if there is no sign of the formation of the fruit bud in September, cut off the shoot again, this time lower, and fruit buds will then form. I am afraid this teaching is a long way from being practical. Shoots that are pinched to within, say, 2 inches of their base in June or July, sometimes make a second growth, though more often on Pear trees than upon Apples. In that case a second pinching is necessary when the additional growth has advanced a few inches. Sometimes no growth following the first pinching takes place, but in its place the bud nearest the extremity swells, and does form what would develop perhaps another year into a fruit bud. The point then is, if all the surplus shoots were pinched to the eye at base, would the buds there be lost for future use by making at once a second growth the same year, instead of plumping up the eye simply with a view to future fruit-bearing? The system of pinching to two and three eyes is undoubtedly wrong with the object of forming fruit buds from the base eyes. I do not advocate, though, the retention of these surplus growths, they should be cut away by all means for another object, that of admitting the free penetration of sun, air, and wind to mature the branches, and to assist in the formation of future bloom buds. These latter are quite distinct from wood growths purely. It is difficult indeed to induce fruit buds to form from purely shoot buds. It has long been thought that the summer pinching advocated favoured this, but by no means is it effectual. If it were not for excluding light and air to the innermost parts of the trees, especially bushes, I would allow them to remain until September, and then give the trees all the pruning they need. It is not necessary to wait until December to complete any pruning operations. The removal of surplus growths from all kinds of trees is quite correct for the assistance in colouring of fruit, whether it be Apples or bush fruits. Where time admits, these latter are much improved in colour and cleanliness by a removal in June of the surplus shoots, not with the idea, however, of inducing fruit spurs to form at the base of the summer shoots. *E. M.*

BOILERS.—Great improvements have been made in the heating power of our garden boilers during late years, thereby saving considerable fuel; but many boilers are complicated in shape, and they are nearly all made of wrought iron, which will not last nearly so long as cast iron. Some twenty-five years ago, I had occasion to put in several cast-iron saddle-boilers, and they are still doing their work as well as ever; but in an unhappy moment I bought a boiler—strongly recommended—of the wrought-iron type, setting it to heat three houses. Judge of my disappointment when, after some eight years' wear, I found this boiler at banking-up time the other night leaking at a hopeless rate, and there was nothing for it but to move all the plants in a temperature many degrees below freezing-point. In examining the boiler, I find that quite as much damage is done in summer, when not in use, as during the winter season; whereas if the boiler had been made from cast-iron, all this upset would have been avoided. *J. Rust, Eridge Castle.*

ROUND *versus* PRICKLY SPINACH.—I am glad you have invited seedsmen to try and clear up this matter in relation to the variety of Spinach which some gardeners have recently so much praised over the old Prickly variety, commonly known as Winter Spinach. As you have quoted from Mr. Vilmorin's admirable book, *The Vegetable Garden*, permit me also to do so in furtherance of my original suggestion, that this Round Spinach was not only round-leaved, but round-seeded, and the variety commonly sown as Summer Spinach. The book says, "Some growers prefer the Flanders for autumn sowing, on account of its large fleshy leaves and hardy constitution." That shows that the common Flanders round-seeded form has long been used for winter work, and the reference is to British cultivation. In addition to the seedsmen, I hope those gardeners who have grown Round Spinach with such satisfaction during the past winter, will also say whether they have really grown the Round-seeded variety, which they ordinarily sow in the summer; or whether they have sown a round-seeded, roundish-leaf form of the Prickly sort. But I would point out that gardeners almost invariably order Spinach under the common appellations of Round or Summer, and Prickly or Winter, and that what is sent out by seedsmen as the former, is what we have grown as such for many years, the Flanders; whilst the Winter or Prickly is the Epinard d'Angleterre, which it is now found to be much less useful or hardy than is the old Round summer variety. *A. D.*

APOSPORY: A CORRECTION.—I observe in the notice of my Aposporous Lastrea that the common crested male Fern is stated to be "frequently, if not constantly, produced from a sexual bud upon the prothallus," instead of from asexual buds. As this gives a directly opposite meaning to the one intended, perhaps you will kindly correct to save misapprehension. In line 2 of column 3, "toral" apospory is printed instead of "soral." I may add that the prothalli in question are throwing young plants freely while still attached to the parent, and in one case without being pegged down. *Chas. T. Druery.*

ERYTHEA EDULIS.—We have had E. edulis in cultivation at Kew since 1883. Neither this species nor E. armata (Brahea Roezlii) can be called good garden Palms in England. On the Riviera, E. armata is fairly plentiful in gardens. See *Kew Bulletin*, 1889, p. 294. *W. Watson.*

MUSHROOM-GROWING ON LAYERS OF LOAM AND HORSE-DUNG.—I fear Mr. Cheshire has found a "mare's-nest" in his new system of growing Mushrooms. I knew the same system tried thirty years ago. Mr. Cheshire, in common with many writers on Mushroom culture, assumes that large masses of manure are considered necessary to their production; whilst the fact is, the deep bed is used to give the requisite warmth to cause the spawn to run, and it is well-known to many of us old stagers that, given the requisite top-heat, 4 inches deep of fresh sweet dung is ample for their most successful cultivation. If the longer continuance of the bed-bearing is a fact, it might be of value in places where a small supply is needed; but I venture to doubt the fact, from a very considerable experience in Mushroom-growing. *John Bester, Manager, Myatt's, Hextable Horticultural Co., Swanley.* [It is a fact known to many of our older readers that the method of making Mushroom-beds in layers of loamy soil and stable-dung was practised at a more distant date than our correspondent mentions; but it did not find general acceptance, because from the small quantity of manure used it was not always possible to get up the heat required to start the spawn. Once in bearing, the beds would produce Mushrooms for a longer period, other conditions being suitable, than a bed put together in the usual way. ED.]

HONESTY.—Probably no spring flower is standing the long-continued drought better than the common Honesty, Lunaria biennis. It throws its large fleshy roots deep down into the soil, and they, acting as feeders at a considerable depth, enable the plant to withstand the heat and drought, which injures the more surface-rooting subjects. It is astonishing, the growth and wonderful head of bloom made by plants standing well apart from each other, in good soil. A thick plantation of Honesty operates to starve the plants, but, when isolated, the remarkable beauty of a well-grown specimen is amply demonstrated. Plants of Honesty do not bear removal, unless it is when they are quite young. It is therefore best to sow the seeds where the plants are to bloom, dibbling in the seeds at ample distances apart, and if they are plump, they are sure to germinate. The white variety forms an admirable contrast to the purple-flowered type. That newer selection, the Early Crimson, is decidedly deeper in colour, and of dwarfer growth, and makes a fine subject in the spring garden. Honesty is one of the hardiest of plants, though liable to be injured by long-continued frosts, and especially when frost follows heavy rain. But plants apparently dead, revive with the influences of spring, and develop into unexpectedly fine examples. *R. D.*

CHRYSANTHEMUMS ALL THE YEAR ROUND.—At the meeting of the Scottish Horticultural Association on Tuesday, the 2nd inst., Mr. McMillan, of Trinity Cottage, exhibited about a dozen of large substantial Chrysanthemum blooms. He said in his

letter, which was read by the secretary, that like Tennyson's brook, he could maintain the supply every month of the year. The other day I called, and received a hearty welcome. Walking through the houses with him, I saw tall Chrysanthemums in flower, and some equally tall in bud, while in the frames this year's cuttings, from 1 to 2feet high, were showing flower-buds at the end of nearly every shoot. Mr. McMillan claims to be quite open about his method of culture, but I could see that he kept something up his sleeve. Mr. McMillan exhibited some of his finest blooms at Earl's Court long before the proper season that were quite a new feature of the show. Mr. McMillan has another hobby besides Chrysanthemums, viz., Rhododendron growing and raising hybrids. He has a fine specimen of the shy-flowering R. Edgeworthii, and some of the young seedlings have the downy-brown underleaf of Edgeworthii. *C. A. M. C.*

EARLY TURNIPS.—On March 6, I made small sowings of Carter's Early Purple Top Strapleaf, Early White Strapleaf, Dobbie's Model, and Snowball Turnip on a wide south border. From the time the plants have been thinned out, water has been daily applied to the soil, with the result that we are now (May 9) drawing excellent Turnips of the first-mentioned variety. The other varieties indicated will give a good succession. Had we not kept the crop well watered, the plants would have certainly bolted. *H. W. Ward.*

EARLY STRAWBERRIES.—I gathered to-day a ripe fruit of the variety John Ruskin growing on a south border in the kitchen garden, and several others will be ripe in a day or two if the weather continues warm. Last autumn I planted 200 young plants of this variety on a border, together with 500 of Noble, to test their earliness outdoors. John Ruskin proves to be decidedly the earlier of the two, but it is not to be compared with Noble as regards cropping. I can only find two berries beginning to colour of this latter kind, whereas of John Ruskin a small dish may be gathered in a few days. The continued drought is beginning to be seriously felt in this district. *C. Herrin, Dropmore, Bucks, May 9.*

EARLY ACTIVITY OF WASPS.—I have had brought to me, by one of my boys, a small wasp's nest containing about twenty maggots. The nest was found hanging to a bush. This (May 6) is the earliest date that I remember to have met with a colony. Last year I found a nest on June 7. I may say that we have killed more queen wasps this spring than ever before, and they are still very plentiful. *John Wilkes, The Gardens, Creswell Hall, Stafford.*

APPLE PESTS IN FRANCE.—There is a great amount of ignorance displayed in the Consular Report noticed at p. 540. The grub in the Apple bloom is that of the weevil, Anthonomus pomorum, see Answers to Correspondents, p. 554, in same No.; it has nothing to do with the winter moth. Mytilaspis pomorum is a "scale," and is probably the "cochineal" insect referred to lower down. There is evidence of a "confusion of epitaphs." *R. McLachlan.*

CUCUMBER DISEASE.—I wish to ask your numerous subscribers, of whom I am one of long standing, the cause and the remedy for the above disease. Having had this gum-disease in the fruit and the foliage in two previous seasons, I thoroughly cleaned the house in the autumn, and again this spring, fresh-painted the woodwork, cleaned the walls with clear water, white-washed with hot lime, dusted while yet wet with dry lime, covered floors with new lime, made the hot-manure beds the required depth, and planted a month since, and the first fruit that set showed the dreadful gum-disease in the skin. Now the plants could not possibly look more healthy than at the present time, yet as soon as the fruit is set, I can see the disease. Is the soil in fault, or what is the cause? Having grown Cucumbers for twenty-five years, I am greatly disappointed, and wish to ask if there is any cure for same, without destroying the plants? I may say, the roots are very healthy, so far as I can see. If you can help me in this, I shall feel for ever thankful. *Market Grower.* [Kindly send specimens of fruit, leaves, and roots. Ed.]

Fig. 86.—Anthurium Scherzerianum: showing effects of manuring and non-manuring.

No. 1.—Plant supplied with Potash; 2, Plant supplied with Phosphoric Acid; 3, the test plant—no manure.

EFFECT OF MANURES ON THE GROWTH OF ANTHURIUM SCHERZERIANUM.

It is a matter of great importance that the precise effects of various manures on the growth of sundry garden plants should be studied as carefully as in the case of agricultural plants. Hap-hazard procedures, if they lead to success, as they often do, also lead to many failures, and almost invariably to great waste of material, and to needless expense. For this reason, we are highly pleased to see that M. Georges Truffaut, son of the well-known nurseryman of Versailles, and a pupil of Professor Dehérain, is devoting his attention to this subject. Object lessons are more instructive to the many than detailed chemical analyses; such lessons were presented at the recent show at Ghent, and this week we give an illustration (fig. 86) copied from the *Revue Horticole*. The illustration and its legend tell their own tale, and we shall have shortly an opportunity of adverting again to the subject when discussing a memoir of the same author on the effects of various manures on the Azalea, and cognate matters.

FLORISTS' FLOWERS.

THE AURICULA.

I wrote, at p. 445, upon the promising character of Auricula bloom in our garden, and it certainly was a very fine show in the Auricula-house; but the leading growers, naturally desirous of getting their flowers ready for the National Auricula Society north and south on April 25, had to use close shading to retard the flowers, with the result that the leaves were flabby, and the plants required very careful inuring to full light and ventilation. Half of our stock of specimen plants were repotted before the close of last month, the leaves and roots having been freed from parasites. The most dangerous-looking insect is the Trama Auriculæ, the woolly aphis of the growers; but it really does not do half so much injury to the plants as the common green aphis. Slugs and maggots can easily be caught and destroyed, but the woolly aphis injures unseen the roots of the plant, and the aphis the young leaves; the latter may be kept under by fumigating with tobacco, and the former can be cleared off the roots at the time of potting, and kept away from the neck of the plants afterwards by dusting with powdered tobacco. If possible, the plants should now be placed on the north side of a wall. The new Auriculas did not generally show their true characteristics, but a notable exception was remarked in a good green-edged variety named Shirley Hibberd (Simonite), exhibited by the Rev. F. D. Horner; there are but two plants of it in existence, but as shown, it is certainly superior to the Rev. F. D. Horner, by the same raiser. Monarch is a good green-edge, which has been shown in better form. Charmer (Horner) is a remarkably distinct and handsome red self, far superior to Lord of Lorne, or even Mr. Simonite's Ariel. Grayling (Horner) gives evidence of being a really handsome and constant grey-edge flower.

Mr. A. J. Sanders exhibited Engineer, a good dark self; it was only a small seedling plant, but it won the 1st prize at the Auricula show, and a Floral Certificate at the Royal Botanic Gardens; the flowers are of a rich dark colour, and well-proportioned, circular, pure white paste.

Mr. Charles Turner, of Slough, exhibited Winifred, a first-rate white-centred Auricula, with plum-coloured shaded edge; this, and Toujours Gaie, from Mr. J. Douglas, a variety of the same type, obtained Floral Certificates at the Royal Botanic Gardens. The progress in the raising of seedling Auriculas of high-class quality is slow; a high standard of excellence has been reached, and every new variety that obtains first-class honours makes it more difficult to improve flowers of the class to which it belongs. There is yet plenty of room for improvement, but it can only be done by taking the very best varieties now in cultivation, and working from them.

The Tulip.

Not long after the bloom is over, it will be time to dig up the bulbs. When the petals drop, the seed-pods should also be broken off; if this is not done, the stem would remain green until the seed approaches the ripening stage, and the bulbs would thereby be much exhausted. Whenever the stem becomes so limp that it can be bent double without breaking, the bulbs may be lifted; this should be done when the ground is dry and the day fine, but the bulbs should not be left lying in the sun, as this is supposed to be injurious to them, but I have not observed any ill-effects of it when they have been left for a few hours only, or during the time of lifting the bulbs. I have observed that most of the Tulip fanciers are growing a larger number of breeder Tulips, that is, the self-coloured form of the Tulip. Messrs. Barr & Son had long beds of selfs in their grounds at Long Ditton, and Mr. Barr senior believes that the self form of the Tulip will be the more popular type with the general public. The beautiful tracery of flame and feather requires careful inspection, and flowers with these markings do not

so promptly arrest attention as the selfs do; but those who take first to the selfs will soon be lost in admiration of the finely-feathered and flamed Bizarres, Byblœmens, and Roses. Mr. Barr has in his grounds representatives of every class, and it gives great delight to the fancier to study the intermediate gradations of flame and feather, between, for example, the feathered form of Bizarre, Masterpiece and the heavily flamed Duke of Devonshire and George Hayward. The breeder form of the Bizarre is in some instances a rather dingy-looking flower; but Goldfinder, a Lancashire breeder, is very lovely. Again, we have in the Byblœmen class, some very fine rectified varieties, and I think even a better range of colour than in the Bizarres. Mrs. Jackson, with snow-white flowers and purple-black feather and flame, is the most distinct in the class; although Talisman (hardy) has the properties of form and marking dear to the florists in greater excellence than any other. The lovely rose and rose-scarlet selfs are dazzlingly beautiful. Lord Derby and Annie McGregor are two of the best rose selfs. They are also beautiful in the feathered and flamed state. Those intending to form small collections of Tulips, should have a few of each of the classes. There are really nine well-marked divisions. The feathered and flamed Bizarres and the self state, the other two divisions of Byblœmens and Roses being defined in the same way. *J. Douglas.*

Societies.

ROYAL HORTICULTURAL.

May 9.—The show on Tuesday last was again a very fine one, and a large number of Certificates and Awards were given to new and interesting plants, which were present in greater quantity than usual.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. J. Fraser, O. Thomas, H. B. May, H. Herbst, C. F. Bause, C. T. Druery, G. Stevens, J Jennings, H. C. Leach, G. Nicholson, T. W. Girdlestone, G. Gordon, P. Barr, T. Baines, J. D. Pawle, G. Paul, H. Cannell, R. Dean, C. E. Shea, E. Mawley, H. H. D'Ombrain, J. Walker, C. Noble, C. E. Pearson, and H. Turner.

A nice miscellaneous group of plants was staged by Messrs. Cutbush & Son, Highgate, N., including a number of very well-flowered Heaths, some Caladiums, Genista Scoparius var. Andreana, a very fine pan of Leschenaultia biloba-major, some plants of Saxifraga pyramidalis, Palms, &c. (Silver Flora Medal).

Messrs. P. Barr & Sons, King Street, Covent Garden, had an extensive collection of hardy herbaceous cut flowers, and a collection of May-flowering Tulips. Both sections were exhibited well and in great variety, the collection taking up one side of the entire hall. Two Silver Flora Medals were granted, one for the Tulips, and another for the collection of herbaceous flowers.

A fine collection of new Roses in pots, and some boxes of cut blooms, were staged by Messrs. William Paul & Son, Waltham Cross, Herts. In pots were included Crimson Queen, Clio, Spenser, Danmarck, and Duchess of Albany (Silver-gilt Flora Medal).

A miscellaneous group of hardy flowering shrubs came from Messrs. James Veitch & Sons, Chelsea, including Rhododendrons and Azaleas in variety, Spiræa confusa, Prunus Pissardii, the best varieties of Acers, Cercis siliquastrum, Chionanthus retusus, Cytisus scoparius Andreanus, and some sprays of Viburnum plicatum. The cultivated form of this plant, in which all the flowers are sterile, was figured in our columns for July 29, 1876, p. 141. Both plants are beautiful flowering shrubs, and very decorative (First-class Certificate, and a Silver-gilt Flora Medal for the collection).

Messrs. E. D. Shuttleworth & Co., Limited, Peckham Rye, had a large miscellaneous group of greenhouse, stove, and hardy plants, including noticeable plants of Lilium Harrisii, Lælia purpurata, Hydrangeas, Ferns, Caladiums, Cypripediums, Dracænas, &c. (Silver Banksian Medal); also a collection of alpine and hardy flowering plants, including Pyrethrums, Centaureas, Narcissus, Ranunculus, Irises, Auriculas, &c. (Bronze Banksian Medal).

A fine collection of cut blooms of Rhododendrons and Azaleas were from Messrs. Paul & Son, Old Nurseries, Cheshunt. Some pretty seedling Rhododendrons, obtained from a cross between R. Fortunei and R. Mrs. C. Butler were shown, but received no award; also a number of Cannas in pots, one of which, Sophie Buchner, a very large-flowered variety, of intense scarlet, and of dwarf habit, received an Award of Merit (Silver Banksian Medal).

A very pretty group of Cannas, well grown, and edged with Spiræas, Ferns, &c., were sent by J. C. Tasker, Esq, Middleton Hall, Brentwood, Essex (gr., Mr. P. Perry), including Victor Hugo, F. Benary, fine dark crimson; Admiral Courbet, &c. (Silver Banksian Medal).

Two large boxes of cut Roses of excellent quality, and representing Tea varieties, were again sent by Mr. Frank Cant, Colchester (Silver Banksian Medal).

Another exhibit of cut Roses came from Mr. George Mount, Exotic Rose Nursery, Canterbury. Very good were The Bride, La France, Niphetos, Jean Ducher, and Catherine Mermet.

Mr. Charles Turner, Royal Nurseries, Slough, showed a plant of his new Polyantha Rose, Turner's Crimson Rambler; also sprays of bloom. This is a very free-growing and free-flowering variety of this section.

Messrs. Sander & Co., St. Albans, exhibited Dracæna Sanderiana, figured in these columns (p. 445), and received a First-class Certificate for same. It was also shown grouped together in a large pot or pan, in which it is a very graceful and decorative subject. Messrs. Linden, of the Horticulture Internationale, also showed a specimen of this plant under the name of D. thalioides foliis variegatis. A green specimen of the Sanderiana type was also shown under the name of D. thalioides, but the committee did not recognise this name, and a First-class Certificate was awarded to the variegated plant, subject to the plant being known by its correct name.

A First-class Certificate was awarded to Ulmus Wreedi aurea, some sprays of which were exhibited by Mr. Leach, gr. to the Duke of Northumberland, Albury Park. This is a very pretty and distinct variety. Some bloom of Pæonia Emodi came from Mr. Moore, Superintendent of the Botanical Gardens at Glasnevin, and received a Cultural Commendation, also a spike of Crinum latifolium.

H. J. Elwes, Esq., Colesbourne, Gloucestershire, sent blooms of Cyclobothra pulchella, a pretty yellow species; C. alba, and C. amœna, for which latter a First-class Certificate was awarded, subject to name being verified. The flowers are rosy-lilac, sepals and petals rather long and narrow, petals very much twisted, and are very hirsute; anthers white, and therefore conspicuous.

Mr. C. G. van Tubergen, Haarlem, Holland, sent flowers of Fritillaria Biliacea, F. biflora, F. montana, F. pyrenaica, and F. recurva. This last is a very pretty and distinct form; the flower is scarlet and orange, and the end of the petals recurve.

Some blooms of new Tree Carnations were sent by Mr. Wm. Smythe, Basing Park Gardens, Alton.

Mr. W. Gilbert, 1, Albert Terrace, Bishop's Waltham, sent a new Zonal Pelargonium, Beauty of Waltham, white with orange eye; and some Aquilegia Pearl Blancher. No award was made.

Messrs. H. Cannell & Sons, Swanley, showed some new Begonias. An Award of Merit was granted to B. R. B. Parsons, a large double Pink of good habit; and to Hector, a bright double scarlet. There was also a large number of cut blooms of both double and single varieties.

Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, had a dozen blooms of the fine new yellow Carnation, Pride of Great Britain, noticed in these columns last week; and E. A. Kirby, Esq., Kelsey Park, Beckenham (gr., Mr. Mark Webster), had a group of Myosotis in pots (Vote of Thanks).

Mr. J. Miller, gr. to Lord Foley, at Ruxley Lodge, Esher, brought a plant in flower of Hippeastrum solandræflorum. The scape was from 3 to 4 feet high, and the flower of this species is white, with a very long and narrow tube (Vote of Thanks).

Messrs. Jas. Veitch & Sons, Chelsea, obtained an Award of Merit for Phyllocactus Plato, a very showy and pretty variety, flowers very large, and bright scarlet. The plant was in a 7-inch pot, and had several buds upon it. Also a First-class Certificate for Tillandsia leodiensis, a good pan of which was bearing five spikes of bloom. The base of the bracts is bright scarlet, falling to greenish-yellow at the apex; it is a very showy species. Also a First-class Certificate for Magnolia hypoleuca, a single white species.

Messrs. Charlesworth, Shuttleworth, & Co., Heaton, Bradford, were granted a First-class Certificate for Bilbergia sanguinea.

A First-class Certificate was also awarded to a single white Rhododendron named Helène Schiffner, exhibited by M. J. T. Seidel, nurseryman, Striesen bei Dresden. The blooms are not large, but the trusses are very compact, and the plant has a nice habit; the flowers are pure white.

The Hon. E. H. Ellis, Bucks, sent two plants in flower of Kæmpferia rotunda.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. J. O'Brien (Sec.), De B. Crawshay, T. Statter, S. Courtauld, T. B. Haywood, F. Sander, H. Williams, A. H. Smee, J. Douglas, J. T. Gabriel, C. J. Lucas, W. H. White, E. Hill, J. Jaques, C. Pilcher, Hugh Low, H. M. Pollett, and H. Ballantine.

A small group of select Orchids was contributed by Messrs. F. Sander & Co., St. Albans, among the things specially noteworthy being the fine forms of Cattleya Mossiæ, some new Cypripediums, including C. Victoria Mariæ of the C. Chamberlainianum section, but lacking the rose spotting on the pouch; Oncidium leucochilum nigrum, a nearly black-spotted form of the type; a grand plant of the crimson Aërides Savageana; the violet Utricularia longifolia, the members of which family are usually staged with the Orchids; a noble purple Sobralia macrantha, Epidendrum atro-purpureum Randii, Scuticaria Hadwenii, Lælia elegans, Odontoglossums, &c.

W. F. Darnell, Esq., Devonshire House, Stamford Hill (gr., Mr. W. Davies), showed a group of Orchids, tastefully arranged with light foliage plants, and made up chiefly of varieties of Lælia purpurata, Cattleya Mendeli, C. Skinneri, Miltonia Roezli, Dendrobium thyrsiflorum, &c. (Silver Flora Medal).

Messrs. Pitcher & Manda, The United States Nurseries, Hextable, Swanley, Kent, staged an extensive group of Orchids, in which the great variety in the forms of Cattleya Mossiæ, of which there were many, was remarkable. Among other Cattleyas was the pretty C. Luddemanniana concolor, almost wholly of a soft rose-pink, and there were also several good examples of Lælia purpurata, Phalænopsis, Odontoglossums, &c. (Silver Banksian Medal).

Thos. Statter, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), showed a splendid form of Dendrobium Bensoniæ album, much longer in the flower than any hitherto shown (First-class Certificate).

Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne (gr., Mr. Murray), showed Cattleya × Harold (Warscewiczii ♂ × labiata Gaskelliana ♀). It bore distinct traces of C. Warscewiczii, which in many respects it resembled (Award of Merit).

Messrs. Hugh Low & Co., The Nurseries, Clapton, exhibited Lælia purpurata Lowiana, in which the labellum is of a dark purplish-maroon, and very fine and distinct (Award of Merit).

De Barri Crawshay, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cooke), showed Odontoglossom crispum var. De Barri Crawshay; a noble flower, heavily spotted with reddish-brown, and well worthy to rank with the best (Award of Merit). Mr. Crawshay also showed two other fine Odontoglossums in O. crispum Miss Florence Bovill and O. c. guttatum.

Major-General Berkeley, Bitterne, Southampton, showed the fine old Dendrobium sulcatum, D. transparens album, D. hercoglossum, and Galeandra nivalis.

Charles Rickman, Esq., Springfield, sent Cypripedium × Charles Rickman (barbatum var. × bellatulum), a variety closely resembling C. × Lawrebel (Award of Merit).

Messrs. Jas. Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, showed Dendrobium × Mentor (superbum ♂, primulinum ♀), with pretty light rose flowers; and a plant of their beautiful Lælio-Cattleya Hippolyta (Lælia cinnabarina ♂, C. Mossiæ ♀), with fine Indian-yellow and crimson flowers.

T. B. Haywood, Esq., Woodhatch, Reigate (gr., Mr. Salter), sent a spike of Epidendrum Schomburgkii.

W. Thompson, Esq., Walton Grange, Stone, Staffs. (gr. Mr. W. Stevens), sent spikes of two fine and dissimilar forms of Odontoglossum triumphans.

Messrs. Charlesworth, Shuttleworth, & Co., Heaton, Bradford, showed Oncidium macranthum, Charlesworth's variety, in which the fine flowers had brownish sepals and violet lip; also O. serratum, and a curious little Odontoglossum from Peru.

Chas. L. N. Ingram, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), showed Cypripedium

striatum×, and a C. niveum× resembling C. Tautzianum.

A. J. Hollington, Esq., Forty Hill, Enfield (gr., Mr. E. Ayling), exhibited a fine form of Cypripedium×Evenor (Argus ♀, bellatulum ♂), with pale yellow flowers, profusely dotted with purple. Stephen White, Esq., Oakwood, Crayford, Kent (gr., Mr. A. Tomlin), sent a fine spike of Cyrtopodium Andersonii var. cardiochilum; and R. Brooman-White, Esq., Arddarroch, Garelochead, N.B., sent a curious form of Cypripedium concolor, with purple-striped sepals and petals.

Fruit Committee.

Present: Philip Crowley, Esq., in the chair; and Messrs. Jno. Lee, W. Wilks, T. F. Rivers, Harrison Weir, G. Bunyard, G. Taber, T. J. Saltmarsh, G. T. Miles, J. Wright, A. Dean, J. A. Laing, W. Bates, G. Reynolds, G. H. Sage, J. Hudson, G. Wythes, F. Q. Lane, J. Smith, R. Hogg, H. Balderson, and J. Cheal.

There was but little fruit exhibited on this occasion. Mr. E. Gilman, gr. to the Earl of Shrewsbury, Ingestre Hall, near Stafford, sent a dozen fruits of a seedling Melon named Ingestre Hybrid, the result of a cross between Hero of Lockinge and Countess. The fruits were all of good average size, of very decided yellow, and slightly netted; flesh white, and flavour good. This very pretty Melon received an Award of Merit, being the only award made by this committee.

Mr. Wythes, gr. to the Duke of Northumberland Syon House, Brentford, had a couple of dozen fine Brown Turkey Figs (Cultural Commendation). Also some bunches of Tomato Old Red, to show its free-fruiting and its early properties.

Mr. Leach, gr. to the same nobleman at Albury Park, had a collection of Lettuces, Leach's Winter White Cos and Tennis Ball, which were Culturally Commended. Mr. Leach also exhibited some varieties of Peas in the bine, to show their degrees of earliness. Autocrat, sown January 25, was a month later than Duke of Albany, and is just in bloom. Duke of Albany, put out of 3-inch pots on January 25, and has had no protection, had the Peas just formed. Chelsea Gem, sown on January 25, was ready for use on May 9, without any protection, but the pods shown were not particularly full.

Mr. E. Beckett, Aldenham House Gardens, Elstree, sent a box of Strawberries, British Queen, a very good sample; also a basket of good Tomatos, Reading Perfection. A few fine tubers of Potato Snowdrop were from the same exhibitor (Cultural Commendation).

Mr. T. W. Bond, gr. to C. Ingram, Esq., Elstead House, Godalming, Surrey, sent three Cabbages, Veitch's Earliest of All, with a note to the effect that they were sown on January 22, and were ready for use during the first week in May.

Mr. W. Iggulden, gr. to the Earl of Cork, Marston House, Frome, Somerset, sent a box of Strawberry Laxton's Noble, labelled outdoor Strawberries. The fruits were quite ripe, and highly coloured.

Lecture.

In the afternoon a lecture, entitled, "How to Solve Chemical Questions concerning the Soil," was delivered by Professor Cheshire. The lecturer commenced by pointing out the essential constituents of plants, but as oxygen and hydrogen are supplied in the form of water, and carbon, sulphur, magnesia, iron, &c., are generally present in sufficient quantities in the soil, it was generally nitrogen, potash, or phosphorus that were deficient, and it was always desirable to know exactly what the land stood in need of before applying any form of manure. Farmyard manure, the lecturer said, had been found to be exceedingly good, and it contained all the necessary elements, and was therefore a good manure to apply when in ignorance of what was really wanted; but, after all, as the land would probably be deficient only in one or two elements, it was not the most economical method to always apply the same manure, especially when that manure may contain other ingredients in far larger proportion than the desired ones, and which in some cases were actually harmful to the soil, because it contained that constituent in large proportion already. The best way was to determine just what was required by certain soils to grow certain crops, and then to supply that manure in as pure a form as possible, and not in association with other substances which would be equally valuable in lands that required them. The lecturer spoke of the solubility of the different elements of the soil, and said that in the past, when farmers or gardeners sent samples to the analyst the samples were subjected to strong acids, and everything in the soil was made soluble, the report to the gardener afterwards sent, stating not the amount of matter in the soil available to the plants, but the entire quantity contained in the soil, some of which would require fifty years of weather and tillage to bring it into a soluble state. However, chemistry had advanced since then, and the analyst would now send his report as to the amount of available matter, and also as to the amount of dormant matter which may possibly become available in the future. The lecturer then went on to speak of the difficulty of supplying land with nitrogen, and said that combined nitrogen could not be bought much less than £20 a ton, and then explained the discovery that has of late been made as to the capacity of leguminous plants to abstract nitrogen from the atmosphere by the agency of the nodules on the roots. The lesson which was to be learned from this was, that the cheapest and best way of keeping land supplied with sufficient nitrogen was to grow frequently crops of some Leguminous plant, and the part of the plant which is not required for the crop should be afterwards turned in, thus securing the combined nitrogen that has been taken from the atmosphere. The haulm of Peas and of other such plants should never be thrown away or burned.

Professor Cheshire afterwards gave some practical hints how to test a soil in order to see what constituent necessary to the crop desired is lacking. If a leguminous crop was intended, some French Beans could be sown in four pots. In one pot would be ordinary soil without any added manure whatever, and in another the same soil with potash added, and another with phosphorus added, and another with both of the manures added. It might easily be seen from the result of this which ingredient the soil was short of. It was not likely that a member of this order would require anything else in greater quantity than is possessed by most soils. In regard to plants belonging to any other order, they could be tested in a similar way, but nitrogen would also have to be tried in this case. Each manure should be tried separately, and in conjunction with each of the others, and the whole together also, when the result would be scientifically correct.

NORFOLK AND NORWICH HORTICULTURAL.

May 4.—The above Society, which claims to be the second oldest in the kingdom, having been established in 1830, held its spring show on the above date in St. Andrew's Hall, Norwich. In the Anemones and Narcissi the flowers were, owing to the season, pale in colour; and as to Narcissi, varieties which one looks for in the middle of May, were staged to make up a box of twenty-four varieties, notable among which were N. poetarum, Rev. J. B. M. Camm, and Bessie.

The Orchids were a fairly flowered collection, the 1st prize for six being taken by Canon Ripley, whose gardener, Mr. Reed, staged well-flowered plants of Dendrobium infundibulum, Masdevallia Harryana, Phaius Wallichii, Cattleya Mendeli, Odontoglossum triumphans and O. Pescatorei. The 2nd was secured by Col. Rous, who had two varieties of Chrysis, Odontoglossum cordatum and O. crispum, a fair Dendrobium thyrsiflorum, and a Cattleya Mossiæ, with a finely-coloured lip.

In the class for three, the 1st fell to E. F. Trafford, Esq., Wroxham Hall, the most noteworthy plant being a well-done Lælia purpurata; while Canon Ripley came a good 2nd.

Purely spring flowers were not largely shown; indeed, with the exception of a fine collection of Auriculas, not for competition, staged by the Borough member, J. J. Colman, Esq., which contained some good green-edged and self-flowers, and a large tableful of good seedlings, contributed by Mr. G. Daniels, there was nothing worthy of special notice. Tulips were bad and rough—indeed, nothing but early Dutch kinds; but two exhibits of species were very good, viz., T. retroflexa and T. monstrosa, shown by Mr. Carder. Narcissi, twenty-four varieties, Mr. Edmonds, of Caister, a good 1st; Miss Spurrell, 2nd; the latter lady securing 1st in the smaller class for six varieties.

The only remarkable lot of foliage plants was staged by Mr. H. Trevor, who had clean well-done plants of Cycas revoluta, C. Normanbyana, and Pandanus utilis, crowned by a grand piece of Phœnix reclinata on the upper stage.

Flowering plants are very mediocre, but a good Trachelospermum jasminoides, shown *au naturel*, was a very graceful and pleasing object, and deserved the premier award, which Mr. J. G. Snelling secured with it. A feature in one stand of cut flowers, which secured an extra prize, was the Streptosolen Jamiesonii, not often exhibited.

Primulas in variety were shown in pots and as cut flowers, the lovely Japanese section, Cortusoides, and Sieboldi varieties, being very attractive, T. Barrett Lennard, Esq., taking an extra prize with a small but well-done collection.

Vegetables were good, especially the Asparagus and early Potatos, and the hard fruits, in good condition. The Strawberries, as might be expected, were noteworthy, especially so some examples of new varieties raised by the gardener at Gunton Park, Mr. Allan, the best being a fruit resembling Waterloo in colour, but of Pine shape, named Lord Suffield; the other two kinds being Empress of India and Gunton Park, already certificated by the Royal Horticultural Society. Mr. Allan also staged a vase, which was unique in the blending of autumn and spring, containing cut flowers of Anemone Alboroughensis and Chrysanthemums, two late-flowering Japanese varieties.

NURSERY NOTES.

MR. A. WATERER'S, KNAP HILL.

A few days since we embraced the opportunity of calling upon Mr. Anthony Waterer at Knap Hill Nurseries, near Woking, so well known as a grower of Rhododendrons, Azaleas, Conifers, and all kinds of ornamental and forest trees. Had it been a fortnight later the show of bloom Mr. Waterer would have been able to have shown us would have been very much more abundant than at present, for, speaking generally, the Rhododendrons had not commenced to flower, although exceptions to this were occasionally met with, which were literally alive with colour, and served to enable one to picture the general effect produced in the long avenue when the many thousands of plants will be equally as gay as are the few that are blooming now. It was, nevertheless, quite easy to realise what kind of a show will be seen by the visitors to the nursery at Whitsuntide, or shortly afterwards, for the buds are plump, and on the point of bursting, and the greater part of the bushes have a wealth of such that is not often surpassed. In addition to this, they present a most healthy appearance in foliage and stem, and there is little doubt but that this season they will be quite equal to the average.

The Azaleas are more forward, for they had already created a wonderful variety of colours and shades. Some of the hybrids that have been raised at this establishment are of the most delightful tints, and many of them show a decided advance in size of flower, and also in the substance of the petal. Particularly pleasing to us were some of the yellow and orange-yellow varieties, a section which appears to be very largely represented. Then there are the double varieties, and these in most colours, but particularly in pink, yellow, and white. These hybrid Azaleas are a family of themselves, whose origin has been in the garden, for the hybridiser has freely crossed the A. mollis, A. pontica, and the Ghent Azaleas, with each other, until all that can be said of them is that they are hybrids. Some scarlet crosses of good colour and large blossoms will undoubtedly become very popular. None of these crossed Azaleas raised at the Knap Hill establishment receive names, Mr. Waterer holding rather strong opinions as to the practice of naming crosses of any plant, which through extensive hybridising is constantly being surpassed, and which are not sufficiently distinct to be readily recognised by the ordinary gardener. He, therefore, prefers to sell them as seedlings.

Apart from the Rhododendrons and Azaleas, there are plenty of attractive trees and shrubs in these

large nurseries. Many of the species of Coniferæ are represented by large and handsome specimens, and some of the oldest and seldom-seen flowering shrubs find a place amongst those more generally met with.

Close to the office we were interested in a double Wistaria sinensis, which has been planted at the foot of a tree of Laburnum alpinum, and which it has climbed over. The Laburnum was in full bloom, and the yellow racemes were hanging amidst a profusion of Wistaria racemes. This double form has racemes quite as long as the single one produces, and the flowers are of the same colour, and equally fragrant. The Thorn was also very pleasing, and appears to be more than usually floriferous this season, as well as being a month earlier than usual. The White, Red, Double, and Weeping forms, are all represented, this latter variety being especially graceful, as seen from a short distance. The Golden Oak, too (Quercus concolor), is a very distinct and ornamental subject for the park or grounds, where the Purple Beech will be equally attractive. The weeping variety of this latter seems difficult to keep in character; however, there were several specimens here that promise fairly well to maintain the drooping habit. The Lilacs appear to have done badly this season, either frost or drought having injured them, and but little bloom is being produced. Mr. Waterer attributes the cause to frost. On the contrary, Chestnuts are more than usually good, the flowers large and strong, and of great profusion. Mr. Waterer has a plantation of an improved red variety; from one plant which happened to be carrying bloom, it was easy to see that the colour is much darker than the ordinary one, but it is possible it may prove to be a shy bloomer. The groups of Pyrus are in full bloom, including amongst others, the Pyrus Maulei, P. Simoni, a fine dark crimson one; and Knap Hill Scarlet, a handsome large-flowering variety of bright scarlet.

A good batch of the handsome Cytisus scoparius Andreanus was in one of the houses, looking gay with their abundant flowers.

Rhododendron præcox, of the beauty of which there is but one opinion, has been but little use here. The frost had spoiled them before they were well out. It should be afforded shelter where grown in the open, and it is wished to avoid disappointment. R. ciliatum, plants of which have been outside for some years, have been killed this season also by frost. Azalea mollis and sinensis had also been injured, scarcely a bud remaining that was good. The long continued drought has been prejudicial, but no serious injury has been occasioned, as plenty of water is obtainable here, and Mr. Waterer has had all available hands engaged in watering by means of horse water-carts, and by a fire-engine. This by no means exhausts the interesting features of Knap Hill, but our space will not allow us to linger further, even in such a lovely spot, where but a short time ago we had escaped from the smoke, and were listening to the songs of the lark, the cuckoo, and the nightingale, all in the space of a few minutes. Many thousands of people go to see the Rhododendron show annually, and we are sure it must afford them, as it did us, a very enjoyable and interesting visit.

Mr. A. Knowles' Daphne Cneorum.

A few days since, when we called at the nursery of Mr. Arthur Knowles, at Horsell Birch, there was a very good display of this pretty little plant. It has always given considerable trouble to cultivators, and in this respect it appears to be a little exceptional here. About 2500 plants are raised and disposed of each year, and Mr. Knowles informed us that he could dispose of a greater quantity if he had them. The hot, dry weather has not been very congenial to them, and when in the blazing sun, the flowers appear not half so well as when in the shade.

Most of the plants had been raised by layering, and appeared to be doing fairly well. Mr. Knowles has been working up for some years a variety which he describes as a sport, and which was taken, in the first instance, from a shoot that showed considerably more vigour than did the rest of the plant. He claims that the constitution of the sport is stronger, that the leaves are a little larger, and that it blooms twelve days later than his other and older stock, which he cultivates under the name of Daphne Cneorum major.

Forestry.

The Eastern Plane
(Platanus orientalis, L.).

This tree I find in many parts of the country is often confounded with the great Maple or Sycamore, which is called the Plane tree. The Sycamore, Acer Pseudo-platanus, is a thoroughly hardy tree, which reproduces itself from seed on the spot, and is valuable in every sense of the word, but the Plane tree proper is generally considered by far the best tree for embellishment, on account of its rich green foliage, which retains its colour till the autumn. It is indigenous to the east of Europe, west of Asia, and other parts, where it is said to attain a large size, and when planted in this country, on a good loamy soil, mixed with alluvial deposits or organic matter, so as to attract and retain moisture, it yields to no other deciduous tree for planting as specimens in the park or on the garden-lawn. I should, however, mention that, in some parts of the country, it is apt to be occasionally seared by late spring frosts, which seem to be its principal drawback in this country. It was introduced into Great Britain about the middle of the sixteenth century, and although it has never been planted to a large extent, yet there are some grand specimens to be found in different parts of the country; some of the best which I have ever seen are growing in rich loamy soil in the south of England. Young trees in a healthy progressive state of growth often produce leaves some 12 inches broad by about 10 inches long; and as these are finely lobed, palmate, and the divisions lanceolate, they impart to the tree an attractive well-clothed appearance. As the tree, however, advances in growth and age, the leaves gradually become smaller, but they retain their verdant colour. It generally produces its flowers in May, and in favourable seasons matures its seeds in October. These are contained in round cottony balls, which hang suspended from the branches and twigs, and are very ornamental. Sometimes the Plane is propagated from seed, and sometimes from layers, in a similar manner as the Lime. In spring the balls containing the seed should be broken up, and the seed extracted, and sown broadcast on rich friable ground of a free, open texture, formed into beds 4 feet in width. The seed should be pressed on to the surface with the back of a spade or light wooden roller, which is all the covering they require. March, or early in April, is the best time for sowing the seed, and should the weather continue dry for any great length of time, it is advisable to cover or shade the surface of the bed with evergreen branches or spray, to promote germination. During their nursery career, the plants or young trees should be frequently transplanted, in order to promote the formation of sturdy well-furnished stems and bushy roots, which will prove beneficial for the growth of the trees when planted out where they are to remain. When the plants or young trees produce a plurality of shoots at the top, which is not unfrequently the case, these should be cut off or cut back, as the circumstances of the case may suggest, leaving the strongest and most central for the leader. Any pruning that the trees require, had better be done about the month of August, when the descending sap will soon form a cicatrix, and the wound heal up without any injurious effect whatever. When the trees are well handled in this way in early life, the tops are of a uniform well-balanced shape, and not apt to be ruptured by wind during a storm; therefore, let me impress upon the mind of the planter the utility of early training. Of all the deciduous trees suitable for the climate of this country, there is none perhaps more suitable for planting in streets and smoky districts about large towns, where the air is contaminated with noxious vapours, than the Plane tree, and if the trees have been well prepared in the nursery, they can be planted out with safety after they attain a good size, which is also a recommendation in their favour. The genus, however, comprehends another species than that of the former, viz., the great Western Plane (P. occidentalis, L.), which is a native of North America, and was first introduced into this country about the year 1630, and what I have said regarding the former species, may be applied here with advantage. The contour of the tree is not unlike that of the oriental species, but rather more spreading, and the branches and twigs exhibit rather more of a curved or zigzag appearance than the former species; these are well clothed with leaves of a large size, angled, lobed, the upper surface of which is of a glossy green colour, while the under surface is slightly covered with down. In its native habitat it is said to attain a large size, and in this country specimen trees are recorded to have attained a height of about 100 feet in seventy years. When planted in suitable soil, and in genial situations, the tree forms a dense canopy of verdant foliage, which renders it highly suitable to form a shade or screen for promenades, and other places where shade and shelter is desirable during the heat of summer. The bark on the stems and limbs of both species is apt to become detached in spots here and there, and fall to the ground of its own accord. In places where it is desirable to plant these trees on clay soil, or hard inorganic matter, the ground should in all cases be well broken up by trenching previous to planting; and in cases where the soil is of a poor thin texture, a little fresh soil, rich in organic matter, may be mixed with the staple, to give the trees a good start. By a little painstaking in this way, the trees may be planted with success in soil of a poor thin character. *J. B. Webster, Fairview, Stangmore, Dungannon.*

Trees and Shrubs.

Ontario Poplar.

As showing the quickness of growth of even this well-known quick-growing Poplar, I may mention that when making an addition to our parish churchyard (Kirkby Wharfe) in 1883, it was necessary to plant a screen on one side, to shut out some ugly buildings then there; and a row of Limes and Poplars was planted, the latter to be removed in due time. We have done this to-day. The average height of the six was 29 feet, and average girth at 3 feet, 30 inches, thus providing material for a good stout fencing post 6 feet long, and a stout rail 9 feet ditto, in ten years. One of the annual rings was ¾ inch in diameter in the largest tree. *H. J. C., Grimston.*

Acer Miyabei.

In the number of *Garden and Forest* for March 29 is a figure of this recently-discovered Japanese Maple. It is closely related to the Norway Maple, A. platanoides, and was described by the late Russian naturalist, Maximowicz, in *Melanges Biologique*, xii., 725. Professor Sargent tells how he came upon the tree by accident during the detention between the arrival of one and the departure of another train. Seeing a small grove of trees, he walked towards it, and there, amongst a quantity of A. pictum, he found a number of fine trees of A. Miyabei, covered with fruit, and surrounding the house of an officer of the Imperial Forest Department, who had been living for years in entire ignorance of the fact that he was enjoying the shade of one of the rarest trees in Japan! Professor Sargent obtained a quantity of seed sufficient to make the tree common in American and European gardens.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees — a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.

England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending May 6, is furnished from the Meteorological Office:—

"The *weather* was somewhat unsettled in the west and north during the earlier part of the week, and rain was experienced in those regions almost daily. In the south and south-east, however, although the appearance was less fine than of late, the conditions, except in a few localities, remained dry. Towards the end of the week the weather again became fine, dry, and settled over the entire kingdom.

"The *temperature* continued above the mean, the excess ranging from 1° in 'Scotland, E.,' and 2° in 'Scotland, N.,' to 4° or 5° in most other districts. The highest of the maxima were registered either on the 4th or 5th, when they ranged from 80° in 'England, S. and S.W.,' and 77° in 'Scotland, N. and the Midland Counties,' to 70° in 'Scotland, W.' The lowest of the minima were recorded during the earlier days of the week, and varied from 27° in 'Scotland, N.,' and 28° in 'Scotland, E. and the Midland Counties,' to 36° or 37° in the western and southern districts.

"The *rainfall* was again less than the mean in all parts of the kingdom. Over eastern, central, and southern England, the fall was extremely slight, and in some localities there was no fall whatever; in Ireland, Scotland, and the north-west of England, the fall amounted to two or three, and in 'Ireland, N.,' to four-tenths of an inch.

"The *bright sunshine* shows a general decrease on that reported of late; owing to the cloudiness during the earlier part of the week in Ireland and Scotland, the aggregate was less than the normal. The percentage of the possible duration ranged from 18 to 27 in Ireland, from 22 to 30 in Scotland, and from 41 to 57 in England. In the Channel Islands, however, the percentage was again as high as 81°."

MARKETS.

COVENT GARDEN, May 11.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

Little or no alteration from last week. The exceptionally fine spring has completely glutted our market with hothouse goods, prices keeping very low. *James Webber, Wholesale Apple Market.*

Potatos.

Trade for old Potatos is at a standstill. Best samples selling slowly, at 45*s.* to 60*s.*; ordinary, 30*s.* to 35*s.*

New Potatos.—Large arrivals; prices lower; only a limited demand. Malta Rounds, 10*s.* to 12*s.*; Kidneys, 12*s.* to 16*s.*; Teneriffe Kidneys, 10*s.* to 15*s.* *J. B. Thomas.*

SEEDS.

London: *May* 10.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market thinly attended. The phenomenal drought naturally restricts present sowing orders. Red Clover-seed, however, is very firm at the recent advance; whilst likewise, also through scarcity, Alsyke, white, and Trefoil, all keep strong. Sainfoin appears about exhausted. For Tares there has lately been an improved request. Canary seed is steady; holders maintain that any change must be an upward one. Hemp seed is slow. For Rape seed more money is asked. For Mustard there is no alteration. The Board of Trade returns give the imports into the United Kingdom for the first four months of this year, as 173,276 cwt., value £434,510, as against 170,352 cwt., £382,666 for the corresponding period of 1892.

FRUITS AND VEGETABLES.

Borough: *May* 9.—Quotations:—Spinach, 2*s.* to 2*s.* 6*d.* per bushel; Cauliflowers, 1*s.* 6*d.* to 2*s.* per dozen; Greens, 5*s.* to 6*s.*; Parsley, 2*s.* 6*d.* to 3*s.* per dozen bunches; Carrots, 3*s.* to 3*s.* 6*d.*; Egyptian Onions, 6*s.* to 7*s.* per cwt.; Horseradish, 2*s.* 6*d.* to 2*s.* 9*d.* per bundle; Apples, 7*s.* to 12*s.* per case.

Spitalfields: *May* 9.—Quotations:—Cabbages, 3*s.* to 4*s.*; Cauliflowers, 6*s.* to 9*s.* per tally; Spinach, 1*s.* 6*d.* to 2*s.*; Beetroot, 1*s.* 6*d.* per bushel; Seakale, 1*s.* 3*d.* per punnet; Greens, 4*s.* to 5*s.*; spring Onions, 3*s.* to 4*s.*; Parsley, 4*s.* per dozen bunches; forced Rhubarb, 1*s.* 3*d.*; natural do., 2*s.* to 2*s.* 6*d.* per dozen bunches; Horseradish, 2*s.* 6*d.* per bundle; round Radishes, 9*d.* to 1*s.*; long do., 6*d.* to 8*d.* per dozen bunches; Endive, 1*s.* to 1*s.* 6*d.* per dozen; Cabbage Lettuces, 8*d.* to 10*d.* per dozen; Mustard and Cress, 2*s.* per dozen baskets; Egyptian Onions, 6*s.* per cwt.; Carrots, 50*s.* to 70*s.* per ton; Tasmanian Apples, 7*s.* to 10*s.* per box; American do., 18*s.* to 20*s.* per barrel.

Stratford: *May* 9.—There has been a good supply of all kinds of produce at the above market during the past week, and a brisk trade has been done at the undermentioned prices:—Cabbages, 5*s.* to 7*s.* 6*d.* per tally; Greens, 4*s.* 6*d.* to 4*s.* 9*d.* per pad; Cauliflowers, 2*s.* to 2*s.* 3*d.* per dozen; Carrots, household, 40*s.* to 60*s.* per ton; do., cattle-feeding 28*s.* to 32*s.* do.; Mangels, 18*s.* to 22*s.* do.; Onions, Egyptian, 5*s.* 6*d.* to 6*s.* 6*d.* per bag; Apples, American, 18*s.* to 24*s.* per barrel; Cucumbers, 2*s.* to 4*s.* per dozen; Onions, bunch, 3*s.* to 4*s.* per dozen; Radishes, 4*d.* to 1*s.* per dozen.

Farringdon: *May* 11.—Quotations:—Carrots, 60*s.* to 65*s.* per ton; Beetroots, 50*s.* to 60*s.* do.; Greens, 4*s.* 6*d.* to 5*s.* per pad; bunch Greens, 8*s.* to 10*s.* per dozen; Spinach, 2*s.* to 2*s.* 6*d.* per bushel; Cucumbers, 2*s.* 6*d.* per dozen; Asparagus, 1*s.* 6*d.* to 2*s.* per bundle; Egyptian Onions, 5*s.* 6*d.* per cwt.; Apples, Tasmanian, 9*s.* 6*d.* to 10*s.* 6*d.* do.; Pearmains, Sturmer Pippins, and French Crabs, 9*s.* 6*d.* to 10*s.* each per case; American Nonpareils, 17*s.* 6*d.* to 20*s.* per barrel.

POTATOS.

Borough: *May* 9.—Quotations:—English Magnums, 40*s.* to 70*s.* per ton. New, 10*s.* 6*d.* to 25*s.* per cwt.

Spitalfields: *May* 9.—New Potatos ranged between 12*s.* and 16*s.* per cwt.

Stratford: *May* 9.—Quotations:—Dark-lands, 30*s.* to 40*s.*; light-lands, 40*s.* to 66*s.*; Main Crop, 70*s.* to 80*s.*; Bruce's, 40*s.* to 70*s.* per ton.

London Averages: *May* 10.—Quotations:—Magnums, 40*s.* to 70*s.*; Hebrons, 50*s.* to 70*s.*; Imperators, 40*s.* to 60*s.*; Belgians, 55*s.* to 60*s.* per ton. New:—English, 2*d.* to 4*d.*; Jerseys, 1½*d.* to 3*d.*; Guernsey Kidneys, 2*d.* to 3*d.* per pound; Malta Kidneys, 12*s.* to 14*s.*; do. Rounds, 9*s.* to 10*s.* per cwt.

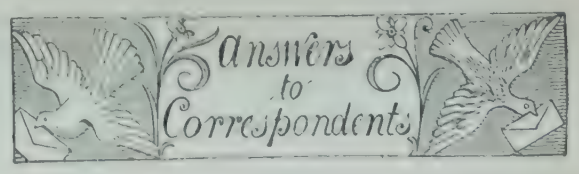
Farringdon: *May* 11.—Quotations:—Main Crop, 75*s.* to 80*s.*; Sutton's Abundance, 75*s.* to 80*s.*; Bruces, 60*s.* to 65*s.*; Magnums, 45*s.* to 50*s.*; Imperators, 45*s.* to 50*s.* per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending May 6, and for the corresponding period last year:—1893: Wheat, 25*s.* 10*d.*; Barley, 23*s.* 11*d.*; Oats, 19*s.* 5*d.* 1892: Wheat, 31*s.* 6*d.*; Barley, 25*s.* 10*d.*; Oats, 27*s.*

HAY.

Averages.—The following are the averages of the prices at the various metropolitan markets during the past week:—Clover, prime, 80*s.* to 115*s.*; do., inferior, 70*s.* to 75*s.*; hay, best, 85*s.* to 115*s.*; do., inferior, 65*s.* to 75*s.*; and straw, 30*s.* to 45*s.* per load.



Correction: Cœlogyne Sanderæ (*vide J. E.*, last week) was not described by Dr. Kränzlin, though hearing he had proposed the name for the plant, his proposed name was adopted. "R. A. R." described it.

Crow Onion: *D. T. F.* This native plant, also called Crow Allium, Crow Garlic, is Allium vineale. It is said to be very near A. sphærocephalum, and perhaps only the bulb-bearing form of that species. It is not easily destroyed in land not under regular cultivation. The numbers might be lessened by forking the ground over whilst the tops are green, and throwing out the bulbs. Cutting off the flower-heads, which will soon be appearing, might do some amount of good.

Double Narcissus poeticus Blind: *A. P.* We are sorry to be unable to give the reason. With us the plant is invariably blind.

Exudation of Resinous Matter from Stone-Pine Needles: *H. J. C.* It may be due to injury from severe frost, insect-puncture, or perhaps from excess of moisture.

Gooseberry Shoots Disfigured: *W. G.* There is no trace of insect-life on the Gooseberry samples, save a solitary common scale, quite incapable of causing the mischief. The injury may be due to a rust-fungus, Æcidium grossulariæ; but kindly send other specimens for investigation.

Heckberry, also Hagberry, Hegberry, and Hecberry: *D. E. P.* The above are local names, mostly in use in the north country for Cerasus (Prunus) Padus, or Bird Cherry. These names are derived from the Anglo-Saxon *Hege*, a hedge = modern German, *Hecke*. This pretty half tree, with white blossoms, which appear in short racemes, will succeed as well in Berkshire or Wilts as in Westmoreland. It is deciduous. There are several varieties, as C. P. argentea, C. P. aucubæfolia, C. P. bracteosa, C. P. heterophylla, and C. P. rubra.

Insect: *F. H. E.* The fly sent has no connection with Cattleyas, and is harmless. *R. M. L.*

Lilac: *W. S., Sutton.* The prolonged drought is undoubtedly the cause of the unsatisfactory condition of the Lilac. We have seen numerous cases identical with yours. In favourable positions the plants have not suffered.

Names of Plants: *G. McKenzie.* 1, Tellima grandiflora; 2, Mitella pentandra; 3, Mitella diphylla; 4 Ruscus hypophyllum.—*F. K.* 1, Sericobonia ignea. Specimen very poor. — *Ripley Moss.* 4, Mnium hornum; 5, Hypnum commutatum.— *G. P.* 1, Sempervivum ciliare; 2 and 3, Pyrus arbutifolia, two forms; 4, Spiræa Blumei; 5, Geranium sylvaticum.—*Q. R.* Prunus Padus.—*F. C.* Menyanthes trifoliata, Bog-bean.—*R. R. P.* 1, Oncidium Cebolleta; 2, Schomburgkia rosea.—*Delta.* Maxillaria cucullata.—*T. F.* Ochna multiflora.—*J. M. Meath.*—1, Heuchera glabra; 2, Pulmonaria officinalis; 3, Ranunculus aconitifolius, fl.-pl.; 4, Trollius europæus; 5, Saxifraga rotundifolia; 6, Geum coccineum.—*J. U.* Dendrobium tortile.—*U. C. C.* 1, Lonicera Ledebourii; 4, Chærophyllum hirsutum. — *W. P., Epping.* Epimedium alpinum.—*J. E.* 1, Jasminum suavissimum; 2, Sisymbrium Sophia; 3, Pelargonium fumarioides.—*F. S. M.* Coccoloba platycladon.

Plum Disfigured: *D. T. F.* Frost is very probably the cause, or strong sunshine, the fruits being wet at the time. No fungus.

Sport from Pelargonium Madame Thibaut: *J. K.* So far as we can judge from the petals—for the bloom had fallen to pieces before it arrived—the sport is a desirable variety.

Sweet Cherries Dropping their Fruits: *J. T. L.* It may be a natural shedding, due to a too free set, or the trees in pots may have suffered from lack of moisture at the root, or been exposed to frosty draughts, but probably it is the first-named cause.

LARGELY INCREASED CIRCULATION of the "GARDENERS' CHRONICLE."

Important to Advertisers.—*The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,*

Increased to the extent of 75 per cent.

Advertisers are also reminded that the "Chronicle" circulates among country gentlemen, and all classes of gardeners and garden-lovers *at home, that it has a specially large* foreign and colonial circulation, *and is preserved for reference in all the principal Libraries.*

CONCENTRATED MANURE.
GLOBE FERTILISER.
When using this Fertiliser for Flowers, Fruits, and Vegetables, results are marvellous. Plants grown in the open air are equal in Bloom and Beauty to those grown in hothouses.

GLOBE MILL COMPANY, Stratford Market, London, E.

PEARSONS'
CHEMICAL MANURE.
This Manure has now been before the public for five years, and has, from its intrinsic merits, almost without advertising, forced its way into the front rank. Extensive trials during above period have convinced us, that for efficiency and cheapness, there is nothing in the market to touch it; we having employed it with the fullest success upon Vines and other Fruit Trees, Pelargoniums, Fuchsias, Chrysanthemums, and almost all kinds of Greenhouse Plants; this opinion is supported by all the gardeners who have tried it, all being enthusiastic in its praise.
Per ton, £16; per cwt., 20s.; ½-cwt., 12s.; 28 lb., 7s.; 14 lb., 4s.; 7 lb., 2s. 6d. Sample Tins, 1s. 3d.
Half-cwt. and upwards sent Carriage Paid to any Station in England, Scotland, or Wales.
Circular, containing further details, instructions, and testimonials, free on application.
J. R. PEARSON & SONS,
CHILWELL, NOTTS.

NATIVE GUANO.—Best and Cheapest Manure for Garden Use. Price £3 10*s.* per ton, in bags. Lots under 10 cwt., 4*s.* per cwt.; 1 cwt., Sample Bag, sent Carriage Paid to any Station in England, on receipt of P.O. for 5*s.*
Extracts from 16th Annual Collection of Reports:—
NATIVE GUANO, for POTATOS, VEGETABLES, &c.
H. Brinkworth, Potato Grower, Reading, used for Potatos, Onions, and Carrots, results:—"Very good; never had better crops."—J. Butler, Sittingbourne:—"Used for Potato, Celery, and other Market Garden Crops, with very good results; Potatos large, clean, and free from disease. Best and Cheapest Manure in the Market."
NATIVE GUANO, for FRUIT, ROSES, TOMATOS, &c.
J. Peed & Sons, Streatham, used for Fruit Trees and Roses, results:—"Very satisfactory; we use no other Guano now; consider yours preferable to Peruvian."—J. Finch, Orrell Gardens:—"Used for Vegetables, Tomatos, Grapes, Cucumbers, and Flowers, with satisfactory results. Most excellent for Potatos, and many other things. The Cheapest Manure in the Market."
Orders to the **Native Guano Co., Ltd.**, 29, New Bridge Street, Blackfriars, London, where Pamphlet of Testimonials, &c., may be obtained. AGENTS WANTED.

To MARKET GARDENERS and OTHERS.

THE PROPRIETOR of IMPORTANT GARDENS REQUIRES a PRACTICAL PARTNER for the Market Gardening Department. Particulars to—
S. B. VARDES, Estate Agent, Cheltenham.

TRAVELLER.—An active energetic Representative REQUIRED by a well-established House, with an increasing connection, doing a good business in Hardy Plants and Bulbs, Dahlias, Chrysanthemums, Carnations, Herbaceous Perennials, &c. Exceptional opening for a first-rate man. None need apply whose character will not bear strictest investigation. — Write, stating age, and giving particulars of previous engagements, references, &c., to Y. S., *Gardeners' Chronicle* Office, 41, Wellington St., Strand, W.C.

WANTED, a GARDENER, for three Houses and Conservatory, comprising Vines, Stove, Greenhouse, and Bedding Plants, also Kitchen Garden, and a little Housework. Suburban. Married man preferred. Wages 25*s.* per week.—Address, G. W. STONE, 3, Arthur Road, Hyde Side, Lower Edmonton.

WANTED, a HEAD GARDENER (Scotch, and single man preferred), where four are kept. Must have a thorough knowledge of latest and most approved Horticulture, and been accustomed to Grow Fruit and Flowers for Shows. Wages dependent on qualifications.—Apply, ZETA, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, as GARDENER, a thoroughly steady respectable Man, to take charge of about 2½ acres of Flower and Kitchen Gardens, with Stove and Greenhouse; one Under Gardener kept.—Apply, with full particulars, to Mr. C. G. MOTT, Harrow Weald, Middlesex.

WANTED, a thorough WORKING GARDENER, up to his work in every respect as an all-round Gardener; specially good with Grapes, Peaches, Tomatos, Cucumbers, Mushrooms, Roses, and other Flowers. Eight Glasshouses, one acre Walled Kitchen, and usual Flower Garden.—State full particulars and wages, to W. A. GLYNN, Seagrove, near Ryde, Isle of Wight.

WANTED, as HEAD WORKING GARDENER, for a Nobleman's Country Place, a thoroughly competent all-round Gardener, married, with little or no family. Accustomed to a Geometrical Garden, and good Bedding Out. Experienced, energetic, orderly, and methodical; a good manager of men, and with good taste, both in Flower and Kitchen Garden, and Table Decorations. Church of England.—Apply, with full particulars, references, and wages required, to SUPERINTENDENT OF PARKS, New Lodge, Hyde Park, London, W.

WANTED, AT ONCE, a SINGLE-HANDED GARDENER, with thorough knowledge of Kitchen and Flower Gardening; also of Fruit and Plants under Glass. Single man, to lodge and board on premises.—Mr. GURRY, Abington Place, Newmarket.

WANTED, an UNDER GARDENER, three kept. Must have some knowledge of Glass. Strong, active and not under 18 years old.—C. LODER-GILBERT, Caradoc, Ross, Herefordshire.

WANTED, SEVERAL GARDENERS, who have had practice among Vines.—Apply personally, at Claigmar Vineyard, Church End, Finchley, N.

WANTED, a PROPAGATOR of Alpine and Herbaceous Plants. Wages to commence, 21*s.* per week.—Apply to BARR AND SON, Nurseries, Long Ditton, Surrey.

WANTED, a FOREMAN.—Must be well up in Stove and Greenhouse Plants, Vines, &c, especially Chrysanthemums. One preferred with some knowledge of Orchids. Age not under 24. Wages 19*s.* per week, and lodgings.—Apply to J. MINTON, The Gardens, Rawdon Hill, Arthington, Leeds.

WANTED, for the Houses, under an English Foreman, a steady active young MAN, with two or three years' experience, to assist in a good Market Nursery. Comfortable rooms provided on the premises.—State wages, age, &c., to SAMUEL McGREDY AND SON, The Nurseries, Portadown.

WANTED, an INDOOR MAN SERVANT, capable of taking charge of a small Garden.—Address, T. T., 46, Wilbury Road, Brighton.

WANTED, a young MAN, in the Houses, under the Foreman; from London Market Nurseries preferred.—J. WALTON, Florist, Eltham Road, Lee, S.E.

WANTED, a young MAN, for Market Nursery. Must be used to the Trade. Wages 18*s.*—C. RADFORD, Effingham Nursery, Lee, S.E.

WANTED, TWO active young MEN used to Market Nursery.—Apply, stating age and experience, to G. LANGE, Chambery, Hampton, Middlesex.

WANTED, a good HANDY MAN, for a Gentleman's Estate, to do Painting, Glazing, Rough Carpentering, &c. Good wages. — Apply, F. DEBNAM, Spring Grove Gardens, Isleworth.

WANTED, a smart active young MAN, for Pleasure Grounds. Wages, 17*s.* per week, milk, &c. —References, &c., to W. J. EMPSON, The Gardens, Ampthill House, Ampthill, Beds.

WANTED, an IMPROVER, under Glass, in a large Nursery, to assist under the Foreman. Must be energetic and trustworthy. Where he will have every opportunity of gaining a thorough knowledge of the business. References must be very satisfactory. State age, and wages expected.—Apply to PETER R. BIRKS, Woodhouse Nurseries, Sheffield.

TO GRAPE THINNERS.—TEMPORARY EMPLOYMENT offered to quick hands. Good wages and overtime.—Particulars from STEPHEN CASTLE, F.R.H.S., Manager, Ashford Vineyard, Fordingbridge, Salisbury.

WANTED, as TRAVELLER, to represent a Firm largely engaged in the Orchid Business, an energetic, respectable, trustworthy Man, who has had extensive experience in this branch of business.—Address, giving references, and stating salary expected, to A. O., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

Provincial Nursery and Seed Business.

WANTED, a SHOPMAN, experienced in the Seed Trade, with a knowledge of the Nursery Business in a Provincial House, and would be required to make Bouquets, Wreaths, &c. Must be Church of England and of high character. —Apply, stating all particulars, salary required, &c., to Z., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANT PLACES.

TO GARDENERS AND OTHERS SEEKING SITUATIONS.

The pressure upon our space at this season of the year is so great, we are compelled to state that advertisements received after 6 P.M. *on Wednesday will, in all probability, be held over to the next week.*

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the *highest* respectability, and *thoroughly practical* at their business. All particulars on application.
Telegraphic and Postal Address—"DICKSONS, CHESTER."

TO FLORISTS.—A young Lady seeks a situation as ASSISTANT or IMPROVER; West End experience.—F. E. S., 11, White Hart Street, Strand, W.C.

HOLLOWAY'S PILLS and OINTMENT.—The most effectual Cure for Gout and Rheumatism.—A frequent cause of these complaints is the inflammatory state of the blood, attended with bad digestion, lassitude, and great debility, showing the want of a proper circulation of the fluid, and that impurity of the blood greatly aggravates these disorders. Holloway's Pills are of so purifying a nature, that a few doses taken in time are an effectual preventive against gout and rheumatism, but anyone that has an attack of either should use Holloway's Ointment also, the powerful properties of which, combined with the effects of the Pills, ensure a certain cure. The Ointment should be thoroughly rubbed into the parts affected at least twice a day, after they have been sufficiently fomented with warm water to open the pores to facilitate the introduction of the Ointment to the glands.

GREEN'S PATENT "SILENS MESSOR" AND "NEW MONARCH"

ROLLING AND COLLECTING MACHINES FOR 1893.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in constant *use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.*

Patronised by—
HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS.
The Late EMPEROR OF THE FRENCH. The EMPEROR OF RUSSIA,
And most of the NOBILITY, CLERGY, and GENTRY of the United Kingdom.

They are the first, foremost, and best in the world.

Royal Horticultural Society's Show, South Kensington, London June 3 to 7, 1881. The *"Journal of Horticulture," of June 9, says:—* "MOWING MACHINES.—After a critical examination, the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 195,000 of these Machines have been Sold since they were first introduced in the year 1856,
And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.
They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

SINGLE-HANDED SILENS MESSOR LAWN MOWER, With Improved Steel Chains and Handles.

To cut 6 in., can be worked by a Lady	...	£1 15 0
To cut 8 in., do. do.		2 10 0
To cut 10 in., do. by a strong youth		3 10 0
To cut 12 in., do. by a man		4 10 0
To cut 14 in., do. do.	...	5 10 0

We are the only makers of Lawn Mowers appointed by Royal Warrant to Her Majesty the Queen, and His Royal Highness the Prince of Wales.

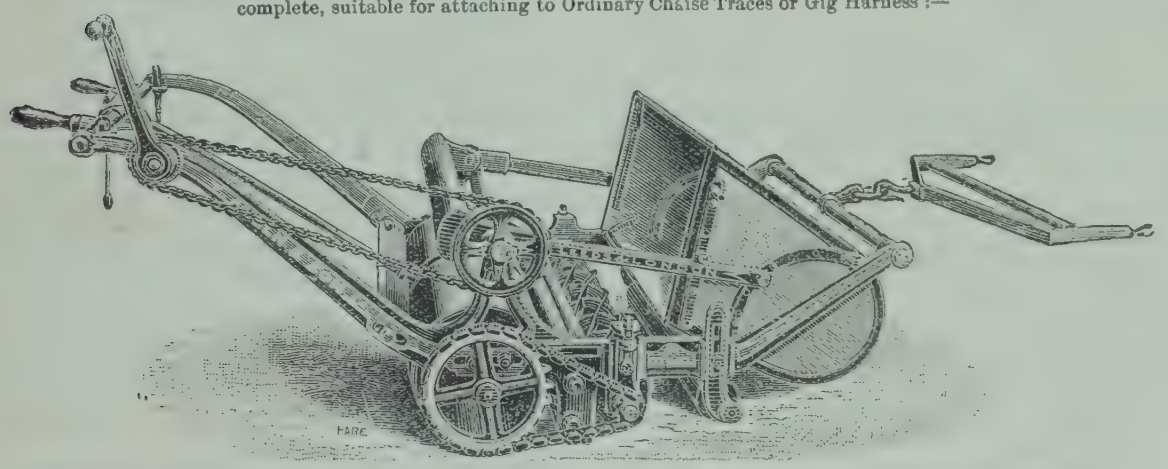
DOUBLE-HANDED LAWN MOWER.

To cut 16 inches, can be worked by one man on even lawn	...	£6 10 0
To cut 18 inches, do. man and boy	...	7 10 0
To cut 20 inches, do. do.	....	8 0 0
*To cut 22 inches, can be worked by two men		£8 10 0
*To cut 24 inches, do. do.	...	9 0 0

* If made stronger, suitable for Donkey, 30*s.* extra.

These Mowers are the "Ne Plus Ultra" and "Acme" of perfection of all Lawn Mowers extant.

Prices of Donkey, Pony, and Horse Machines, including Patent Self Delivery Box, or Side-delivery, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness :—



DONKEY AND PONY MACHINES.

To cut 26 inches	...	£14 0 0
To cut 28 inches	...	16 0 0
To cut 30 inches	...	18 0 0
Leather Boots for Donkey	...	1 0 0
Leather Boots for Pony	...	1 4 0

HORSE MACHINES.

To cut 30 inches	...	£22 0 0
To cut 36 inches	...	26 0 0
To cut 42 inches	...	30 0 0
To cut 48 inches	...	34 0 0
Leather Boots for Horse	...	1 9 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the machine. Packing Cases as per List, except when for export.

BEGONIAS.—Ours are now lovely, and showing more and more every day surprisingly beautiful flowers, and new colours of exquisite tints. Our Seedlings never were so good and robust: we should feel a real pleasure in showing them to friends and coming customers, and also around our establishment, which is now highly interesting. Our Illustrated Catalogue is acknowledged the best Year-Book for the Garden ever issued, and we should like to send it to all who are desirous of having really good Gardens. The best Plants and Seeds, which we send safely to all parts of the world.—H. CANNELL AND SONS, Swanley, Kent.

GARDENIAS, full of Flower.—Specimens, 5s. to 7s. 6d. each. Eucharis amazonica, 5s. to 10s. 6d. each, beautiful quality. Carnations, best named sorts, just coming into flower, 9s. per doz. Pelargoniums and Marguerites, in 48's, 9s. per doz.—WALSHAW & SON, Scarborough.

THE NEW FLOWER from SOUTH AFRICA.

NEMESIA STRUMOSA SUTTONI.—Mr. W. H. GOOD, The Gardens, Wonham Manor, Betchworth, says:—"The Nemesia Seed has come well—fully 60 per cent. It was sown on March 13, shaded for a few days, then exposed to the sun. I saw to-day (April 3) several more plants coming up. We lost three plants after being watered; it is now kept drier."

Price of Seed, 2s. 6d. per packet, post-free. The seed germinates best when sown during the month of May. Nemesia strumosa Suttoni can only be obtained direct from—

SUTTON AND SONS, THE QUEEN'S SEEDSMEN, READING.

Enfield.

TO LAND SPECULATORS, HORTICULTURISTS, BUILDERS, and OTHERS.

IMPORTANT FREEHOLD BUILDING LAND, an old-fashioned RESIDENCE with ORCHARD LAND, 14 newly-erected COTTAGES, and numerous enclosures of Land suitable for Horticultural Purposes, &c., well situated, with frontages upon the Enfield Highway and adjacent to Brimsdown Station, on the Great Eastern Railway, whence London is reached in 35 minutes. Payment (if desired) by instalments extending over five years.

MESSRS. HUMBERT, SON, AND FLINT are instructed to offer the above important PROPERTIES for SALE by AUCTION, at the Mart, Tokenhouse Yard, E.C., on TUESDAY, June 20, 1893, at 2 o'Clock precisely, in numerous lots. The Estate altogether comprises an area of 45 acres, through which an excellent 40-feet thoroughfare known as the Carterhatch Road (kerbed, channelled, and sewered), has recently been constructed, giving access to the numerous lots, and direct approach from Enfield Highway to Brimsdown Station. A portion of the Estate is utilised for Horticultural Purposes, an industry that is making rapid progress in this locality, and for which it is exceptionally well adapted. There are also numerous ripe Building Frontages, which will be offered in small lots, an Old-fashioned Residence, with Orchard, Garden, &c., and 14 Newly-erected Cottages.

Full particulars of Messrs. E. S. TAYLOR, SON, AND HUMBERT, Solicitors, 4, Field Court, Gray's Inn, W.C.; at the Mart, E.C.; and of the Auctioneers, 11, Serle Street, Lincoln's Inn, W.C., and Watford, Herts.

Thursday, June 1.

BARR AND SON, 12, King Street, Covent Garden, W.C.

NEW COLEUS, "DISTINCTION."

INTRODUCED 1892.

To the Trade, 9s. per dozen, in Small Pots.

This is undoubtedly the finest introduction in the way of Coleus yet announced, and will prove a most valuable acquisition for Bedding or Decorative Purposes, the foliage being of a striking reddish rich maroon, and darker in colour than any other variety; it is also of a very sturdy growth, and hardy character.

Award of Merit from the Royal Horticultural Society, August 22, 1892.

J. A. MORRIS, Nurseryman, Church Road, Acton, W.

B. S. WILLIAMS & SON,

Victoria and Paradise Nurseries,

UPPER HOLLOWAY, LONDON, N.

May 13, 1893.

TO MESSRS. SUTTON AND SONS, Seedsmen, Reading.

Gentlemen,—I much regret that I have INFRINGED YOUR COPYRIGHT in certain Illustrations of Vegetables and Flowers, and of a Residence with Tennis Lawn and Garden, and I beg to offer you my APOLOGY for having done so.

I wish to state that the infringements were quite unintentional on my part, as I obtained the electros from a firm who had, as I believed, the right to supply them, and I used these electros in perfect ignorance that the illustrations were your copyright.

I undertake to forthwith withdraw the illustrations complained of, and not to repeat the infringement of these or any other illustrations of yours.

I desire to thank you for your kind consideration in not taking legal proceedings against me, and I authorise you to publish this letter in such manner as you may think fit, and shall be pleased to pay any expense you have been put to in the matter.—Yours faithfully,

W. HOLMES, Horticultural Printer, Ulverston.

GLOBE MILL COMPANY, Stratford Market, London, E.

PEARSONS'
CHEMICAL MANURE.

This Manure has now been before the public for five years, and has, from its intrinsic merits, almost without advertising, forced its way into the front rank. Extensive trials during above period have convinced us, that for efficiency and cheapness, there is nothing in the market to touch it; we having employed it with the fullest success upon Vines and other Fruit Trees, Pelargoniums, Fuchsias, Chrysanthemums, and almost all kinds of Greenhouse Plants; this opinion is supported by all the gardeners who have tried it, all being enthusiastic in its praise.

Per ton, £16; per cwt., 20s.; ½-cwt., 12s.; 28 lb., 7s.; 14 lb., 4s.; 7 lb., 2s. 6d. Sample Tins, 1s. 3d.

Half-cwt. and upwards sent Carriage Paid to any Station in England, Scotland, or Wales.

Circular, containing further details, instructions, and testimonials, free on application.

10 Recent and Highest Awards at Principal Exhibitions.

CAUTION.—No Medal or Exhibition Award has ever been secured by any Firm except this Company for Sphincter Grip Hose, exclusively and distinctively.

Beware of Worthless Imitations and Foreign Importations, of which there are many, and of the goods supplied by any firm or firms making misleading statements. All this Company's Hose made from best Para Rubber, and English materials and labour only, to pass English Government Tests; this last feature in itself a guarantee of quality.

THE BEST, AND THEREFORE THE CHEAPEST.

Orders Executed same day as received. LARGER STOCK KEPT, and SALES GREATER than by any other Firm in the United Kingdom. Write for full Descriptive Price List of above, and of GARDEN PUMPS, HOSE, REELS, and FITTINGS. Post-free.

HEATING! HEATING!! HEATING!!!

THE THAMES BANK IRON COMPANY

Undertake the complete erection of **HEATING APPARATUS for GREENHOUSES, OFFICES, PUBLIC BUILDINGS,** &c. Have the largest stock of **BOILERS, PIPES,** and **CONNECTIONS** in the Trade to select from, and invite inspection of same.

BOILERS of the latest and most approved class, including the

Patent HORIZONTAL TUBULAR, with WATER BARS; CAST-IRON SADDLE, with WATERWAY-END, &c.;
VENTILATING GEAR AND VALVES.

AWARDED THE ONLY GOLD MEDAL at the INTERNATIONAL HORTICULTURAL EXHIBITION, 1892, for HOT-WATER APPLIANCES.

ILLUSTRATED CATALOGUE, 1s. *PRICE LIST FREE.*

UPPER GROUND STREET, BLACKFRIARS, LONDON, S.E.
Telegraphic Address—"HOT-WATER, London." Telephone No. 4763.

NEW TEA ROSE—"CLARA WATSON."
—One of the late Mr. Bennett's Seedlings, a cross between Perle des Jardins and Alba rosea. This is a grand free-flowering variety, very strong grower, and hardy. Colour pearly white, base of petals tinted yellow, centre rosy-peach. Beautiful dark-green foliage, and a very early and continuous flowerer. Good plants, in pots, ready in June, 10s. 6d. each.
GEORGE PRINCE, Seed, Rose, and Strawberry Grower, 14, Market Street, Oxford.

BEAUTIFUL LILIES in POTS.—All the most beautiful Lilies for Greenhouse or Outdoor Decoration. Full Descriptive LIST free on application.
BARR AND SON, 12, King Street, Covent Garden, W.C.

BEAUTIFUL NEW PHLOXES, DELPHINIUMS, PENTSTEMONS, and PYRETHRUMS now ready for planting. Full Descriptive LISTS free on application.
BARR AND SON, 12, King Street, Covent Garden, W.C.

THE BLUE CACTUS DAHLIA—"ROBERT CANNELL."
The Best and Most Distinct—a Real Gem—2s. 6d. each.
6 Best New Cactus Dahlias, including "Robert Cannell" 6s. 0d.
6 Very Fine Varieties ... ... 2s., 12 for 3s. 6d.
6 Lovely Single Varieties ... ... 1s. 9d., 12 for 3s. 0d.

IVY-LEAF PELARGONIUM—"RYECROFT SURPRISE."
The best habit, freest bloomer, largest pip and truss, Salmon-Pink. First-class Certificate Royal Horticultural Society.
1s. each; 3 for 2s. 6d.
6 Fine Varieties, including "Ryecroft Surprise," 3s.

ZONAL GERANIUMS.
6 Finest New Varieties, Single ... 2s. 6d., 12 for 4s. 6d.
6 Very Good Varieties, Single ... ... 1s. 9d., 12 for 3s. 0d.
6 Best Double Varieties ... ... 1s. 9d., 12 for 3s. 0d.
6 Finest Double PETUNIAS, 3s. 0d.
All the above Post-free. Cash with Orders. Send for Catalogue.

FERNS A SPECIALITY.
A magnificent stock of all kinds of Ferns. Abridged Catalogue of 1400 varieties free on application.
ILLUSTRATED CATALOGUE OF FERNS (No. 22), the most beautiful and complete ever published, 2s., post-free. It contains 150 illustrations, and an immense amount of interesting and instructive matter of great value to all Fern cultivators.
W. & J. BIRKENHEAD, F.R.H.S.,
FERN NURSERIES, SALE, near MANCHESTER.

SPECIALITY—
FOLIAGE PLANTS
ICETON'S
LARGE PALMS.
PUTNEY, S.W.

TO NURSERYMEN AND OTHERS.
TUBEROUS BEGONIAS.
Finest quality, in every known colour, Double and Single, for pots or bedding, carefully selected in separate colours.
Doubles, 3s. to 20s. per dozen.
Singles, 15s. to 30s. per 100.
E. EDWARDS, Holmeside, Leighton Buzzard.

LINDEN'S NOVELTIES
For 1893.

ARISTOLOCHIA GIGANTEA
(MART. ET ZUCC.).
Among climbing plants Aristolochias occupy a most prominent place, as much on account of the elegance of their foliage as for the grandeur and peculiar form of their flowers. A. gigantea (which must not be confounded with A. gigas), is of a really gigantic height; its flowers, with a limb of creamy-yellow spotted with purple, measure 30 centimètres in length and 21 in width. They furnish the heights of a greenhouse in an extremely curious and attractive manner, and they have the advantage of not exhaling any disagreeable odour, as do so many of the other species.
Price, 7s. 6d. each.

BEGONIA LANATA
(LIND.).
A beautiful species, with large and fleshy leaves of a beautiful clear green colour, covered with a fine and dense villosity. The stems are also very velvety. The plant as a whole has an appearance of luxuriant strength, and its growth confirms this impression. *Price, 21s. each.*

SMILAX ARGYREA
(LIND. ET ROD.).
This most attractive novelty was awarded a First-class Certificate by the Royal Horticultural Society at the Temple Show, May 25, 1892. Considered as to its elegance of habit and colouring, it is one of the most beautiful introductions of late years. It has long ovate lanceolate leaves, with very short petioles, and three prominent nerves of a beautiful bright green colour, irregularly variegated with silver-white. They measure up to 15 centimètres in length, and about 4 centimètres in width. This Smilax can be considered one of the most charming climbing plants with variegated foliage at present known, and one of the most hardy.
Price, 21s. each.

STENANDRIUM LINDENI
(N. E. BROWN).
This superb ornamental plant recalls S. igneum or Eranthemum igneum so far as its habit is concerned, but is distinguished most decidedly by its brilliant colour, and by its much more ample foliage. The margins of the leaves, and the spaces between the veins, are of a beautiful dull dark green, whilst the veins are of a very light yellow colour, with a wide border of pale yellowish-green. The lower surface is tinted with purple on the edges and between the veins. S. Lindeni received a First-class Certificate at the Royal Horticultural Society's Temple Show in May, 1892.
Price, 12s. 6d. each.

PEPEROMIA METALLICA
(LIND. ET ROD.).
A charming ornamental-foliaged plant of a very pretty appearance, and of distinct colouring, which cannot fail to be sought after by plant lovers. The oblong lanceolate leaves are dark green, shiny, and spotted with metallic facets of green or white along the median line, and in the centre of the blade. The stalks are entirely red-brown or violet.
Price, 12s. each.

TRADESCANTIA ELONGATA
(LINDEN).
A beautiful species of very elegant appearance; leaves oblong acuminate, dark green, relieved by bands of silver-white on the two sides of the median nerve, with a violet purple tint along the centre. It is a vigorous plant of majestic growth, which is destined to be a great success as a decorative object.
Price, 21s. each.

TRADESCANTIA REGINÆ
(LIND. ET ROD.).
The name of this magnificent plant calls to mind the visit paid to the Nurseries of L'HORTICULTURE INTERNATIONALE by our Sovereigns, in 1891. Her Majesty the Queen, during this visit, greatly admired the new Tradescantia, which had just been introduced, and was graciously pleased to accept the dedication. It is, in short, a species of superior beauty, and worthy of such service. The leaves, larger than those of T. elongata, measure over 10 centimètres in length, and 4 to 5 in width; they are variegated parallel with the median line by green, purple, and rose stripes; the edge of the blade is covered with splashings of dark green cutting into the whitish-green ground colour; the nerves are of a very clear green. The colour of the lower surface is a superb dark violet. This beautiful species was awarded a First-class Certificate at the Temple Show, London, in May, 1892.
Price, 21s. each.

The set of the above 7 novelties, £5 5s.

ROSE PROSPECTS.

THE dull days of winter were enlivened, so far as rosarians were concerned, with a veritable "battle of flowers," some of the varieties used on the occasion being not without thorns; the object of the fight was the establishment of a proper date for the Metropolitan Show of the National Rose Society, which some have styled the "Rose Derby." Many who smarted under the blows dealt to them by late seasons, contended for a later date. In vain it was argued that our climate was a very uncertain one; that we were just as likely to have a cycle of early seasons, as we had had one of late seasons; that the great show used to be held on the last Saturday in June, and that under all circumstances it would be best to adhere to the date which had hitherto been used—the first Saturday in July. I believe the controversy might have gone on to this time, had not the editor of the paper in which it was carried on, put his foot down, and requested the combatants to go into winter quarters, and bid them to sheathe their swords — and now what do we see and hear? On all sides Roses coming into flower three or four weeks before their time; secretaries of societies in agonies, some already talking of putting their shows backward a fortnight, others suggesting that the last Saturday in May, or the first in June, would be a more suitable time for the Metropolitan show of the National Rose Society than the first Saturday in July! We have about two months before us, and if things go on as at present, I do not see where the Roses in the South of England are to come from; who can, therefore, do anything but guess as to the Rose prospects?

The character of the blooming season rests on two factors, the way in which Roses have passed through the past winter, and what they will have to endure in the shape of weather until the time of flowering. Now, with regard to the past winter, I do not think that it has been anything like as disastrous as the previous one, or as many supposed it would have been. I have received communications from all parts of the country, and all are pretty nearly alike in their character, viz., that there has been very little loss, even amongst the Teas, which, notwithstanding one may have entertained the contrary opinion, are no doubt more tender than the more extensive class of hybrid perpetuals. In my early Rose days, I used to be told by one who was one of our chief authorities then, that 5° of frost injured Roses. Few would now assent to that. A good deal of the change of opinion on this subject is due, of course, to the much larger cultivation of dwarfs, and the consequent abandonment of standards and half-standards. These latter are still much in favour with exhibitors of Tea Roses, and

it is from these that we hear complaints of losses in low-lying situations; but where they have been grown at an elevation of 400 or 500 feet above sea-level, they have escaped comparatively untouched, for it is frost and humidity that are so injurious. I found, as many have done at pruning time, that the plants had been in many cases severely hit, and that it was, in consequence, necessary to prune very hard; but, then, when dwarfs are grown, there is always the certainty that young shoots will develop themselves from the portion of the plant below ground, and so it has been this year.

I understand that in one of our gardening periodicals an enthusiastic rosarian suggested the probability that, as the plants were well in leaf before pruning, we should not be much troubled with maggot, as they had probably found their way into the more forward buds, and would perish with the pruning. I cannot say that this fond hope has been realised in my own case, and I have heard grievous complaints from many others. I believe a mixture of Paris Green to be effective in destroying the grub, and that it does not injure the foliage. I have never resorted to this method, but have adopted the more tedious perhaps, but still the safer, one of hand-picking. I instruct a boy what to do, and he goes over my small lot in an afternoon.

The most immediate and pressing work now to be done amongst Roses is watering, and I believe that the present, under any circumstances, is the best time for applying liquid manure; it is of very little use to watch for the buds to be formed. Let it be given now, and it will help on the formation of good large buds. There are various manures recommended for this purpose, Clay's Fertiliser, Thomson's Vine and Plant Manure, Jensen's Fish Manure, &c.; but I question, after all, whether there is anything better than a good mixture of cow-manure and soot. The Rose, poetical as its associations are, is very unpoetical in its tastes, being a most gross feeder and drinker, no viands are too strong, no stimulants too heady for it, and therefore, the dose I have alluded to may be administered once or twice a week. There is very little use at any time in watering by dribblets, and in such a season as this, liberality is more than ever necessary. There are many to whom I fear these injunctions are a mockery. Thus, in the weald of Kent, where the inhabitants are entirely dependent on rain, even in a place not ten miles from here, I said something to a brother parson about watering his Roses. "Water my Roses! Why, my dear fellow, I can hardly get enough for bathing myself, and the only thing I can do is to use it afterwards for my Roses!"

It is hardly possible that weather like this will not bring aphides, and when they do appear, as I hear they have done in many places, syringing with soft-soap and water, and afterwards with clear water, is a very good plan, but probably the most effectual way is to use one of the Stott machines with the "Killmright" powder; this is very effective.

Of course, disbudding must soon be seen to. This is generally a June operation, but I see in my own Roses evidence that it must very soon be begun. The central bud of the shoot should be retained, unless malformed, and the others removed with a blunt piece of stick, or the blunt end of a toothpick. Care must be taken not to injure the bud that is left, and, indeed, the whole operation is one which the grower had better undertake himself, and not to trust to inexperienced hands. We have now reached the beginning of the second week of May, and I fear the outlook is gloomy; but we must hope for rain, for not only the Rose, but for all other things has the situation become most serious. There is another very serious matter in connection with Rose prospects which, although it has no present significance, must in the near future be a very potent factor—I mean the tremendous loss of stocks occasioned by the severe drought. As a sample of its effects, I may mention the statement of one grower, which I had from himself the other day:—"I scoured the country last autumn, and got in 25,000 of the finest standard Briars I ever saw, and now I have not 7 per cent. of them alive; and besides this, I find the dwarf seedling Briars and even the Manettis affected." I do not suppose that the general state of stocks is as bad as this; but if there is anything like it in other quarters, the prices of Roses must inevitably go up, and the difficulty of filling up gaps or adding to collections will be very great. *Wild Rose.*

New or Noteworthy Plants.

HYBRID GLADIOLI.

I am indebted to Mr. Sprenger for a fine series of hybrid Gladioli, cultivated by his firm (Messrs. Dammann & Co.) at Naples. Some of them I should have classed as varieties of G. angustus, Linn. (G. trimaculatus, Lam.), and some of them belong to the ramosus group of hybrids, which are crosses between cardinalis and oppositiflorus. Two of the others are quite new to me, so I will notice them briefly.

G. Victorialis ×, Sprenger.—A hybrid between the European G. communis on the one hand, and on the other, the Cape G. cardinalis, or G. Colvillei, which is a hybrid between G. tristis var. concolor (none out of several forms, however, show any approximation to the G. tristis leaf). Leaves ensiform, an inch broad. Spike lax or dense, sometimes 1 foot long, sometimes forked; spathe-valves green, 2 inches long in the lower flowers. Perianth bright pale crimson; tube openly funnel-shaped, curved, an inch long; segments, oblong-cuneate, obtuse, the upper 1½ inch long, the lateral 1¼ inch, the three lower not more than an inch long, and furnished with a faint white line in the centre, which is sometimes bordered by a line of deeper red than the rest of the segment. This is, I think, an improvement from a horticultural point of view on any of the European and Oriental species.

G. Papilio × *gandavensis*.—Leaves under an inch broad. Spikes laxly 8 to 10-flowered; spathe-valves lanceolate, green, with brownish tops, 1 to 1¾ inch long; perianth pale mauve-purple; tube openly funnel-shaped, more than 1 inch long; three upper segments oblong-cuneate, concolorous, about as long as the tube; three lower smaller, with a dark purple spot, with a small white keel in the centre, much less conspicuous than in G. Papilio; style much shorter than the upper segments. *J. G. Baker.*

Cyrtanthus obliquus (fig. 90.)

By the kindness of the Hon. Walter Rothschild, we are enabled to give an illustration of a very fine form of this handsome South African bulbous plant, which flowered in April last in the gardens of Tring Park. The flowers, which are wax-like in texture, are of a clear light yellow, tinged with bright red, the segments having an emerald green band, and the whole flower by the blending of the colours has a peculiarly delicate and attractive appearance apart from its stately beauty as an entire inflorescence, which both in colour and general appearance suggest a giant form of Blandfordia Cunninghami. The genus Cyrtanthus is a very interesting one, composed of species differing much in habit, and consequently divided into three sections under Cyrtanthus proper, Monella and Gastronema. C. obliquus belongs to Cyrtanthus proper, and there are known to gardens but two others, viz., C. carneus, a fine red species, and C. Huttoni, a handsome golden-yellow, tinged with red, the ovaries also being coloured; but these are still very rare. Of the section Monella, C. Tuckii (illustrated in the *Gardeners' Chronicle*, August 6, 1892, p. 155) and C. MacOwanii, a rich crimson species, are two of the finest; C. lutescens is a clear light yellow; C. Mackenni, a pure white; C. pallidus, a light vermilion; and the many dissimilar forms put under C. angustifolius, exhibit such variations both in colour and structure as to point to the probability of some of them being admitted as being distinct species when sufficient fresh material can be obtained to serve for comparison. The Gastronema section have one or two flowered scapes of showy flowers, C. sanguineus being the handsomest, though C. uniflorus, which has white flowers striped with red, is very pretty. All the species thrive in a cool greenhouse or bulb-frame. *J. O'Brien.*

Cypripedium concolor var. striata, *new var.*
